abundance of sea-gulls. The 17<sup>th</sup> it blew very hard out of the S. W. which made the sea foam, yet the day was clear and the night calm, the wind as before. The 18<sup>th</sup> it was a rainy day, the wind at S. W. by S. This was the first time we took each of us our allotment of brandy, being a certain measure which was to serve us for eleven days. The 19<sup>th</sup> it was a clear day, the wind at W. the night star-light, the wind at S. E. The 20<sup>th</sup> it was sun-shine, the wind at S. E. by S. we then discharged our great guns, having no more to fear from the *Biscay* privateers for this season; the night was star-light, the wind at S. W. The 21<sup>st</sup>, day and night misty and rainy; the wind at S. W. The 22<sup>d</sup>, it blew and rain'd very hard, the wind at S. W. The 23<sup>d</sup>, being a cloudy day, the wind at E. we discover'd a whale near the shore, which made us set out our sloop in order to catch him; but he got clear of us, it turning a dark sky, with rain and mist on a sudden, and in the night it rain'd very hard; the wind at S. E. The 24<sup>th</sup>, the wind was at S. E. by S. with rainy weather in the forenoon, but the afternoon being fair, we went to the *Red-Hill* for some falletting, but found none; at night the wind was at S. E. The 25<sup>th</sup> proved very rainy in the morning, the wind at S. E. by E. but the afternoon and night it was very stormy weather. The 26<sup>th</sup> it was cold frosty weather, with an easterly wind. The 27<sup>th</sup> being a fair day, the wind at N. E. we went towards the south-side of the isle for some falletting, but found none, being spoiled by the cold rains; in the night the wind turn'd to the W. with very foul weather. The 28<sup>th</sup> a violent storm arose from the north, with some snow and running clouds, but the night prov'd fair, the wind at S. E. The 29<sup>th</sup> it blew very hard from the S. E. with some snow, we observed the height of the sun something above the mountains; the night was fair, and the wind S. The 30<sup>th</sup> it was a cloudy rainy day, the wind at S. W. by W. the night proved very wet, mix'd with snow, and very stormy.

THE 1<sup>st</sup> of October it was fair in the morning, the wind at N. E., but in the afternoon stormy, and a cloudy night, the wind as before; it being frosty weather, we resolv'd to go to the south-side of the isle. The 2<sup>d</sup> it froze so hard, that the ice would bear even on the south part of the island, the wind the same as the day before: We found there a fine spring of fresh water, and the night was very clear, the wind at east. The 3<sup>d</sup> the wind was the same in the forenoon, but turn'd to the west afterwards, with frost and snow, but the night was very fair. The 4<sup>th</sup> prov'd a

frosty day, the wind south; in the morning we saw the *Bears Mountain*; the afternoon was very warm, and the night foggy and rainy, the wind very sharp from the S. W. The 5<sup>th</sup>, the wind continued the same, with rain from morning till night, which made us keep our tents all that day; at night the wind turn'd to the south. The 6<sup>th</sup>, the wind was the same, with frosty weather, we observed the sun in the south, from our huts, about half a pace above the hill; we also could see the *Bears Mountain*: In the night it blew very hard from the S. W. by S. with a hollow sea and very dark sky. The 7<sup>th</sup> it was very stormy, the wind at S. W. by W. we went upon the hill, but met with nothing there, the night proved very wet. The 8<sup>th</sup> the wind continued the same, in the morning with snow, but turn'd to the S. W. by S. in the afternoon; towards night it grew very tempestuous, which shook our huts to that degree, that we were not able to rest, the storm increasing with snow and frost till late in the night; the wind at N. E. and afterwards to the N. with a very hollow sea. The 9<sup>th</sup>, the tempest continued with such violence, that no ship could have rid safely at anchor, with frost and snow, the waves rising by the northerly wind above the fort. It being excessive cold, we began the first time to make a fire; we had still very strong winds from the N. E. by N. all that night, which continuing the same the 10<sup>th</sup>; the excessiveness of the cold forced us to keep at home near the fire side; we found a considerable alteration in our bodies, being troubled with a sudden giddiness in our heads, the wind the same as before. The 11<sup>th</sup> it was very cold and snowy weather, the wind at N. E. we had hung some of our linen in the air to whiten, but were glad to bring them near the fire, they being in a moment frozen as hard as a board; we went along the sea-shore to the southern rocks, but found nor saw any thing there. The 12<sup>th</sup> it froze, snow'd, and blew so very hard; that our barrel of beer, (tho' laid within a fathom from the fire) was frozen, the wind at N. E. we went upon the hill that day but saw nothing. The 13<sup>th</sup> the cold weather continued, we took a view about us on the hill as usual, but discovered nothing, except that we see the sun set between S. and W. very clear, the wind at the north; the beginning of the night was star-light, but towards the morning it was stormy with snow. The 14<sup>th</sup> the wind and weather the same, and we observed the sun to set at S. W. by W. part of the night was star-light. The 15<sup>th</sup> in the morning, finding two whales cast a-shore near the old fur-

nace of *Amsterdam*, we went to work with our harp-irons, launces and hangers, but notwithstanding all our endeavours, they got clear of us by the advantage of the tide; the weather proved indifferently well that day, the wind as the day before; we went upon the hill but without seeing any thing. The 16<sup>th</sup> the weather continued very cold with snow, the wind the same, which occasioned no small alteration in our bodies; we took a view round about us on the hill, but observed nothing. The 17<sup>th</sup> it was still frosty weather, and cloudy, and blew very hard from the north; the evening was star-light; we went in the day upon the hill, but saw nothing. The 18<sup>th</sup> the frost continued, the wind N. we observed the sun to set at S. W. by N. or almost S. W. it was a very moon-light night. The 19<sup>th</sup> the wind kept in the N. we saw from the hill the *Bears Mountain*, and some ice we saw about a mile to the north of the shore; it was a sun shiny day, but the sun did not rise high enough to reach over the hill, into our huts in the bay; it was a bright moon-light night. The 20<sup>th</sup> being a fair day, the wind at N. E. we had sight of a bear, the first we saw here, but could not catch him; we saw great shoals of ice, a good way at sea, from the shore, and the night proved very cold, with an east wind. The 21<sup>st</sup>, it blow'd and snow'd very hard, with a N. E. wind, which continued all night, with very thick snow. The 22<sup>d</sup> it snow'd all day, and the night continued cloudy, the wind the same. The 23<sup>d</sup> was cloudy, the wind at N. E. we took a view again round about us from the hill, but saw nothing; the night was very fair. The 24<sup>th</sup> the wind and weather the same, with some frost, we went upon the red hill, where we saw nothing except the tracks of some beasts, whence we concluded that they began to come down towards the sea-side. The night was clear and frosty. The 25<sup>th</sup> we had an excessive cold, yet sun-shiny day, the wind at S. W. but the sun could not send its beams over the hills to our huts; it being a star-light night, a bear came in sight of our huts, but we could not take him; the wind was the same as the day before. The 26<sup>th</sup> the wind continuing the same corner, we went upon the hill, where we saw nothing but ice, the night was very clear, the wind at the W. The 27<sup>th</sup> it was fair weather, the wind the same, the night very clear and star-light. The 28<sup>th</sup>, the wind blew from the same corner all day and night, with clear frosty weather; we went up the hill but saw nothing. The 29<sup>th</sup> being an excessive cold day, the wind in the N. not only the bay, but also the sea, as far we could see, was full of ice; in the

night it snowed very hard, the wind as before. The 30<sup>th</sup> it continued freezing very hard, with the same wind, and the sea was so full of ice, that we could see no water; the night proved very tempestuous. The 31<sup>st</sup> the north-wind produced such an excessive frost and snow, that not the least drop of water was to be seen, wherever you turn'd yourself, and some of our vessels were frozen to pieces, tho' we sav'd our beer and other strong liquors, by putting them in the buttery cellar.

The 1<sup>st</sup> of *November*, a N. E. wind vehemently increased the cold, so that when we came upon the hill, we could see nothing but ice on the north-side; yet we had still ten hours day, tho' we seldom got sight of the sun-beams, the same not appearing except on the south-side, whither we could not come by reason of the snow and ice. Towards evening we got sight of a bear, but he no sooner saw us making up towards him, but he saved himself upon the ice at sea, these creatures being excessive shy here; the cold grew so fierce by this time, that to preserve our beer, and other liquors, we were forced to kindle a fire in the buttery cellar. Towards night, the bears appeared in such numbers about our huts, that we scarce durst venture abroad; the wind continued as before. The 2<sup>d</sup>, it being a very hard frost, we discover'd five or six bears upon the ice in the bay, whereof we kill'd one, but the rest saved themselves upon the ice. The 3<sup>d</sup>, it was tolerable good weather, the wind at N. E. we saw four bears, one whereof being kill'd by a gun, he got upon the ice in the bay, but was pull'd ashore by the help of some ropes we had by us. The night was star-light, and the wind as before. The 4<sup>th</sup>, the wind being at N. E. it froze very hard, tho' it was very cloudy; we saw three bears, but we could shoot none of them, they detaching themselves immediately to the ice at sea; the wind was W. The 5<sup>th</sup> a south wind produced so violent a snow, that we durst not venture out of our huts; we had of late not seen any sea gulls; all that night the wind continued in the south, as well as the 6<sup>th</sup>, with some tempestuous weather, the wind turned east in the night. The 7<sup>th</sup> it was still, the wind at N. E. we went up the hill, but discover'd nothing; the wind turning to the north in the night, fill'd the bay with great shoals of ice. The 8<sup>th</sup> the wind continued at the north, with excessive cold weather; for want of water we were forced to make use of melted snow. The 9<sup>th</sup>, the north-wind holding still, we made shift to get to the southern shore, where we saw no ice, but plainly discover'd the sun, this being the first time we had sight of

of it in 21 or 22 days last past, being then above half an hour above the horizon; the wind continued in the north, all that night as well as the next day, being the 10<sup>th</sup> when we got sight of a great number of bears. The 11<sup>th</sup> the north wind increased, with thick clouds; at night the wind turned N. E. which continued the 12<sup>th</sup>, with very thick fogs, we went upon the hill, but could see nothing but ice, and some sea-gulls; the night proved very light by reason of the moon; the wind at east. The same wind continuing the 13<sup>th</sup>, it froze most severely; and the 14<sup>th</sup> the wind turned to the west; the cold weather held on and brought vast quantities of ice into the bay; it was a bright moon-shiny night, but we saw no bears that day, tho' the next being the 15<sup>th</sup> we saw three or four, but had only the pleasure of seeing them, they not coming within the reach of our guns. The 16<sup>th</sup> the wind continued in the same corner all that day and night; we let fire at a bear that came in sight of us, but missing him he betook himself to the ice in the bay. The 17<sup>th</sup> the wind turned to the north, with dark snowy weather, yet the cold was not so excessive as before. The 18<sup>th</sup> the frost increased again with a N. E. wind, which however prov'd very tolerable to us hitherto; we spending most of our time in rehearsing to one another, the adventures that had befallen us both by sea and land; it prov'd a very fair and star-light night. The 19<sup>th</sup> the wind turning to the north again, we pass'd the hill to the south-side, yet not without a great deal of difficulty, being often knee deep in the snow; we then had a full sight of the *Bears-Mountain*, and saw the sun just above the surface of the sea, having yet so much daylight left, that we could write and read in the open air, but not within our huts, which made us very melancholy; the wind continued the same as it did the 20<sup>th</sup>, with dark snowy weather; in the night the wind turning to the west, continued there the 21<sup>st</sup>, when going up the hill we looked to the north-side, but could see nothing but ice. The 22<sup>nd</sup>, the wind held westerly, with very cold weather. The 23<sup>rd</sup> the wind shifted to the N. W. by W. and being a fair day, we pass'd the hill to the *Red-bill*, but could see nothing but ice wherever we turned our faces; two or three bears came within sight of us, but not within the reach of our guns: The beginning of the night proving very clear and calm, we discover'd a bear, at whom we discharged our guns immediately (they being always ready charged) and wounded him forely, as we found by the tracks of blood near the sea-shore; yet he escaped to the ice, nothing being more frequent than to

be shot quite thro' the body, without receiving much harm. The 24<sup>th</sup> proving a cloudy dark day, a S. E. wind forced most of the ice out of the bay into the sea, but yet not quite out of sight; at night the wind turning to the west, the bay was filled again with ice; the weather being very frosty; we saw a vast quantity of sea-gulls, but they kept close among the mountains; the wind as before. The 25<sup>th</sup> the wind being in the W. with frosty weather, we saw a vast number of sea-gulls, but they returned to the mountains before night; the wind was as before. The 26<sup>th</sup> the wind turning to the south, it prov'd a tolerable mild day, and most of the ice was carried out of the bay into the sea; the wind as before. The 27<sup>th</sup> it was fair weather, the wind at S. W. but turned to the east in the night. The 28<sup>th</sup> the wind was at S. E. with fair weather; we got sight of a bear again, whom we pursued over the hill, but he proving too nimble for us, escap'd our hands. The weather was (to our great surprise) so mild for these five or six days last past, that we believed the cold to be no more intense here than it was in *Holland*; at the same time the wind as before. The 29<sup>th</sup>, the wind continuing the same, we went over the hill again to the south-side of the isle, where we found all covered with ice; tho' at the same time there was scarce any ice to be seen within half a mile of the northern shore; it was a star-light night. The 30<sup>th</sup> the wind blew from the same corner, and seeing some bears, we made what haste we could after them, but in vain, not being able to overtake them; the wind continued as before, with violent rains.

The 1<sup>st</sup> of Dec. a southern wind produced some rain, but turned to the S. E. at night. The 2<sup>nd</sup> the wind continued the same, with rainy weather, which carried the ice from the shore to the N. at sea: It continued thawing all that night, the weather mild. The 3<sup>rd</sup> the wind at S. with rainy weather and strong winds at night. The 4<sup>th</sup> the wind continuing day and night the same, with cloudy weather, we heard some bears near our huts, and pursued two or three of them, but could take none. The 5<sup>th</sup> the wind still south, with mild calm weather, so that to the best of our judgment, it could scarce be better in *Holland* at that time of the year: We shot one bear as we perceived by the track of blood; but he had strength enough to get upon the ice, out of our reach. The 6<sup>th</sup> the wind blew from the S. E. cloudy sky, but mild weather, with a star-light night; the wind as before. The 7<sup>th</sup> the wind continued the same with foggy weather; but the wind turning to the south, at night it began to snow, and the frost return'd. The 8<sup>th</sup> a N. E. wind produced a dark

a dark and frosty day, but at night it turn'd to the west: Which continued thus the 9<sup>th</sup>, with very clear and cold weather, there being nothing but ice to be seen as far as our eyes could reach. It was a frosty star-light night. The 10<sup>th</sup> was a bright day, the wind still at west; we found our selves surrounded on all sides with nothing but ice, it being a moon-shiny night, we discovered three or four bears, one of which we wounded in two places, yet he escaped our hands upon the ice: We went upon the hill, from whence we could discern nothing but ice; the wind continued at west all night, and the 11<sup>th</sup> with fair weather, but could discover no bears that day; those that had once heard or felt the effects of our guns, beginning to be very shy; it was a very frosty night. The 12<sup>th</sup> in the morning, we had the good fortune to shoot a bear on the head, who dropt immediately; we roasted a leg of him immediately, which happened to be a young one, it relish'd exceedingly well with us, having fed upon nothing but salt meat for a considerable time. The wind held still in the west, with very cold weather, and a calm moon-light night. The 13<sup>th</sup> was a cloudy dark day, the wind at S. W. we went cross the hill to the *Red-Hill*, but saw nothing but vast heaps of ice in the sea, to the north-side; at night the wind turned to the S. E. with snow. The 14<sup>th</sup> proved a clear frosty day, the wind at the south, and a bright moon-light night; we found the ice removed from the shore, a great way into the sea. The 15<sup>th</sup> the wind being the same, it proved a dark day, and the ice was forced back into the bay: In the night (which was exceeding dark) the wind changed to the S. W. The 16<sup>th</sup>, the wind continuing as before, we went up the hill, but observed nothing; it was a moon-light night. The 17<sup>th</sup> prov'd a very cloudy dark day, the wind still at south. We went again up the hill, but saw nothing; it snowed and thawed very hard at night, with the same south wind, which brought us abundance of sea-gulls (as it frequently does) to the sea-side; these make the same noise, here, as they do at *Holland in May*, but retire every night among the mountains, their ordinary receptacle. The 18<sup>th</sup> was a rainy dark day; the wind still at south, which changed to the E. the 19<sup>th</sup> with a hard frost, and a calm and cloudy night; the wind as before, which continued the 20<sup>th</sup> with calm weather, and a dark night. The 21<sup>st</sup>, the wind kept still in the same corner, with dark snowy weather, the snow lying so high upon the ground, that we could not stir out without boots; it froze and snow'd severely, the

Vol. II.

wind at north. The 22<sup>d</sup> in the morning, we found the bay fill'd with ice again, but the cold was so severe, that this was the coldest day we had met with as yet; we had still four hours day-light; the night was star-light and calm. The 23<sup>d</sup> an easterly wind produced a bright frosty day and stormy night, with so much snow, that we durst scarce venture out of our huts, but could see the ice turn'd back into the bay; the wind still at east, which continued the 24<sup>th</sup>, with a foggy air; yet the latter part of the night was star-light, with a hard frost and storm from the N. E. The 25<sup>th</sup>, a fourth wind produced a fair day, but at night the wind turned to the north. The 26<sup>th</sup> it was a clear frosty day, the wind at E. but turn'd to the N. W. at night. The 27<sup>th</sup>, the wind and weather as before, but the night proved dark and calm, with an easterly wind, which continued thus the 28<sup>th</sup>, with very dark snowy weather: In the night it blew hard out of the west, with so violent a snow, that we could not stir out of our huts; weather and wind as before. The 29<sup>th</sup> the wind veering about to the west, produced a clear and excessive cold day, the fore-part of the night prov'd star-light and calm, but the wind turning afterwards to the S. E. it snowed very hard; we found the bay clear of ice in the morning. The 30<sup>th</sup> it blew hard from the S. W. it was a cloudy but calm day; we saw neither bears nor fish. The 31<sup>st</sup> proved an indifferant good calm day, a S. W. wind produced a great deal of snow in the night, but the cold was very tolerable.

In the year 1634, the 1<sup>st</sup> of *January*, having wished one another a happy new year, and good success in our enterprise, we went to prayers to disburthen our hearts before God; the weather was dark, cold and frosty, and the wind as before; two bears came near our huts, but being a dark day and a very deep snow, it was impossible to take them. The 2<sup>d</sup> of *January* a N. E. wind produced a clear day; and the ice was forced out of the bay to sea, yet remained within sight; the fore-part of the night was star-light, but afterwards an east wind brought a cloudy sky along with it. The 3<sup>d</sup> it rained a little, the wind at S. E. which encreased at night, the wind blowing hard from the S. W. The 4<sup>th</sup> we had a fierce westerly wind and cold weather; the bay was so filled with ice again, that we could see no water. The night was pretty mild, with an easterly wind; which continued the 5<sup>th</sup> with a thick fog and frost; the night was star-light, the wind at W. The 6<sup>th</sup> was a clear frosty day, the wind at N. which increased all night with some snow. The 7<sup>th</sup> the wind and weather con-

5 C

tinued

tinued as before, but with abundance of snow, more than we observed before, since our coming hither; besides which, it froze hard all the day and night, that we durst not venture to stir abroad, for fear of being swallow'd up in some pit or other fill'd with snow. The 8<sup>th</sup> the wind blew from the N. E. with very frosty weather, but turned cloudy afterwards; the night was excessive cold and stormy; whereof we now began to feel the effects in our bodies. The 9<sup>th</sup> the wind and weather continued as before, and the bay was fill'd with such vast ice-shoals, that at a distance they appear'd from the tops of our huts, (where we used often to make our speculations) like white hills or land-skies; it was a clear moon-light night, tho' we never got sight of the moon, before she was seven or eight days old, by reason of the high hills betwixt her and us; the wind and weather continued as before. The 10<sup>th</sup>, a N. E. wind produced a bright, calm and pleasant day, but excessive cold, whereof we found the effects. The bay continued full of ice; the greatest part of the night was star-light, but very cold, which seem'd likely to hold. The 11<sup>th</sup> the forenoon proved clear and calm, but the wind turning to the south in the afternoon, it was cloudy, but nevertheless cold, which not a little annoy'd us, especially after the wind brought with it a vast quantity of snow from the S. E. The 12<sup>th</sup>, the same wind and snow continued, so that we could not stir out, tho' the cold was not altogether so excessive as for some days before; in the night the wind and the weather continued as before; and in the morning the ice was forced out to sea, quite out of sight. The 13<sup>th</sup> a S. E. wind brought abundance of snow, and seeing a bear near our huts, we kill'd him with a fusée upon the spot, and so drawing him with ropes into our tent, slay'd him, the weather being so cold, and snow so high, that we could not do it without doors; the night was very clear. The 14<sup>th</sup> it being a tolerable clear day, the wind at east, we went cross the hill to the *Red-bill*, but saw nothing; it was a moon-light night, and the stars appeared sometimes; the wind as before. The 15<sup>th</sup> it was a strong easterly wind with snow, we saw the ice about a mile from the shore; the night was moon-light, the wind at N. E. The 16<sup>th</sup> a south wind produced good tolerable weather; for we made this observation during our stay here, that with a south wind the weather was not so cold as otherwise; in the night the wind turned to the east; it was a dark but frosty night. The 17<sup>th</sup> the wind continued as before, with cold foggy weather; at night the wind turning to the north, it froze

so fiercely that the whole bay was cover'd with ice, there being not the least water to be seen in the morning. The 18<sup>th</sup> was a cold foggy day; in the afternoon the wind turned to the west, and in the night it began to snow, the wind as before, which continued thus the 19<sup>th</sup>, with abundance of snow, so that we were not able to stir abroad. The 20<sup>th</sup> the snow continued with a westerly wind, which lay so high, that we scarce peep'd out of our tent or hut; tho' for the rest, it was not quite so cold, as some days before; and in the Night an easterly wind brought us more snow. The 21<sup>st</sup> the same wind continued very strong, with a violent snow; in the night the wind turn'd to the west. The 22<sup>d</sup> the snow and westerly wind continued with great vehemency, which was follow'd by a very hard frost at night. The 23<sup>d</sup> it was a clear frosty morning, which made us get a little way out of our huts, (tho' not without a great deal of difficulty) to the south side of the isle, to observe the height of the sun; but growing cloudy soon after, could not make an exact observation; however, we saw in the bay thereabouts, the ice and snow at least 6 foot high; the wind was east all night, sometimes we could see the stars; the weather as before. The 24<sup>th</sup> a west wind had blown the ice a great way into the sea; it was first clear weather, then snowy and star-light in the beginning of the night; but in the morning a south wind produced a cloudy sky. The 25<sup>th</sup> the strong south wind and clouds continued, with a very cold night. The 26<sup>th</sup> it snow'd hard, the wind at west: At night we saw the ice again all over the bay; at night (which was cloudy) the wind turn'd to the south. The 27<sup>th</sup> the wind being west, it proved a mild cloudy day, and more ice was forced into the bay; the night was dark and snowy, with an east wind. The 28<sup>th</sup> the wind was at west at first, but veering about to the S. E. it began to snow; the same night the ice was carried a good way into the sea again. The 29<sup>th</sup> the wind turn'd to the S. W. and to the W. at night, with dark rainy weather: In the morning the bay was full of ice again; the wind and weather as before. The 30<sup>th</sup> proving a calm, clear and frosty day, we went (tho' not without a great deal of difficulty) upon the hill; and looking to the south, observed (according to guess) the sun about an hour and half high. In the night the wind turn'd to the east, with fair weather; the stars appeared sometimes; the wind and weather as before. The 31<sup>st</sup> a westerly wind brought us abundance of snow, in the night the wind turn'd to the north, with star-light frosty weather.

The

The 1<sup>st</sup> of Feb. the wind continuing as before; it was clear and calm weather, which made us go upon the hill, where we saw the body of the sun very clear; and on the north-side of the ice nothing but ice as far as we could see; the night was very calm and star-light. The 2<sup>d</sup>, a N. E. wind produced clear but very cold weather, with a bright moon-light night, to our no small satisfaction; we found the bears to grow very shy of us, for we seldom saw any; the wind and weather as before. The 3<sup>d</sup> the wind was easterly, the weather the same, but the night was somewhat cloudy, with a S. E. wind; it was not so cold as before. The 4<sup>th</sup> the wind continued as the day before, in the forenoon, when the ice was carried out of the bay into the sea; in the afternoon the wind turn'd to the south, with snowy weather, but was not so cold as before; it was a star-light night. The 5<sup>th</sup> it was a fullen day, the wind at S. E. and at the east in the night, with some snow; but the cold was somewhat abated. The 6<sup>th</sup> the wind continued as before; the weather calm and cloudy; the wind turning to the S. W. it proved a very clear and moon-shiny night. The 7<sup>th</sup> it blew strong from the E. the weather cloudy. The 8<sup>th</sup> was a very calm day, the wind at south; the ice was carried away quite from the shore, beyond the reach of our eye-sight; it was a clear moon-light night. The 9<sup>th</sup> the wind being northerly, it snowed so violently, that we could not stir abroad, it continued thus all night; the wind at south. The 10<sup>th</sup> proved a pretty mild day, tho' the wind was at the N. but turn'd to the S. W. at night, which was very dark and stormy. The 11<sup>th</sup> was a cloudy day, the wind at the south, but turned to the east at night, but tolerable good weather. The 12<sup>th</sup> the wind continued the same, with some snow; it was a dark night, but not excessive cold, considering the climate and season. The 13<sup>th</sup> the wind stood still in the same corner, with snowy but calm weather; and it was a moon-light night. The 14<sup>th</sup> we had the same wind, and a clear day; but in the night it thawed and grew very stormy. The 15<sup>th</sup> the wind blew as yet from the east, and the snow was so high, that we sunk to the waste in it, so soon as we stir'd out of our huts. The same wind continued the 16<sup>th</sup>, the weather pretty mild, but cloudy: This day we got sight of two wild-fowls, which in respect of their bigness, did appear to us not unlike geese, but were so shy, that they would not come within reach of our guns, we also espied a falcon, but could likewise not come near enough to hit him. The 17<sup>th</sup> the wind blew still from the east, and

had a great deal of snow: In the night the stars appeared sometimes. The 18<sup>th</sup> the wind continued the same, with cloudy but mild weather. The 19<sup>th</sup> it was easterly wind still; and being a fair day, we made shift to get over the hill to the *Red-Hill*, but saw nothing worth taking notice of, not so much as any ice; the weather as before. The 20<sup>th</sup> the weather and wind continued with very little alteration, and was tolerably mild. The 21<sup>st</sup> the wind turned to the N. E. with very bright weather, which made us again get up the hill (tho' not without a great deal of trouble) but could see nothing worth mentioning. The night proved fair and calm, but afterwards frosty with some snow. The 22<sup>d</sup> the wind continued N. E. with much snow; the night was dark and frosty. The 23<sup>d</sup> the wind blew out of the same corner; the weather was very cold, which brought abundance of ice into the bay, but the main sea was clear of it as far as we could see; the night was dark and frosty. The 24<sup>th</sup> an easterly wind produced a most violent frost; the day cloudy, but the night clear, with a north wind, which held the 25<sup>th</sup>, with a cloudy sky; in the afternoon it clearing up in the west, we saw the sun again the first time from our huts, and found it to set at S. W. by W. the night was very dark. The 27<sup>th</sup> it was very calm and mild weather, but at night a south wind brought us a thaw. The 28<sup>th</sup> the south wind and open weather continued, the ice being forced out of the bay into the main sea, yet not quite out of sight, the night was very dark, the wind at S. W.

The 1<sup>st</sup> of March the wind and weather continued as before, with some sunshine in the forenoon, but afterwards it changed and proved rainy: We saw the sun-beams on the S. W. of our hut; the night was very dark, with a S. W. wind. The 2<sup>d</sup> it blew hard from the W. the weather clear and cold; the night was dark and frosty, and the wind very high from the N. E. The 3<sup>d</sup> the wind and weather continued with little alteration; a violent north wind forced the ice into the bay, but in small pieces. The 4<sup>th</sup> the wind turned to the N. E. with cloudy, but calm weather; the cold very tolerable. The 5<sup>th</sup> was cloudy, the wind at N. E. the night the same. The 6<sup>th</sup> the wind and weather continued as the day before; the night proved very calm and pleasant, yet by reason of the snow we could not as yet stir from our huts. The 7<sup>th</sup> it was cloudy but calm, and the night stormy from the N. E. The 8<sup>th</sup> the wind continued as before, with dark and cloudy weather, but a star-light night. The 9<sup>th</sup> the wind blew still from

the

the same corner; both the day and night were cloudy with a sharp frost. The 10<sup>th</sup> it froze very hard, the wind at N. E. with excessive cold weather; the night was very clear and frosty. The 11<sup>th</sup> the weather changed on a sudden, being a calm pleasant fun-shiny day; the south wind in the night brought us such pleasant weather, that we extremely rejoiced at it. The 12<sup>th</sup> the same wind continued, and the ice was carried out of the bay into the main sea, beyond the reach of our eye-sight; the night proved dark, but not very cold; the wind at S. E. The 13<sup>th</sup> was a cloudy day; in the night the wind and weather as before, very dark, but only moderately cold, the wind at N. E. The 14<sup>th</sup> it blew all day and all night, being very cold from the N. E. The 15<sup>th</sup> the wind turning to the south, produced milder weather; and perceiving a bear near our huts (a thing we had not seen many days before) we let fly at him so successfully, that he dropt down dead upon the spot; being glad to find our selves some employment, and to feed upon fresh meat (having lived upon powdered beef for a considerable time) we soon flay'd him, and having hung his skin up in the air to dry, we feasted upon part of the flesh, and sprinkled the rest with a little salt only, by reason we were exceedingly afflicted with the scurvy; the night proved dark, the wind at S. W. The 16<sup>th</sup> the wind continued the same, but the weather was very cold; we fix'd some traps to catch foxes, and in the night the wind turn'd to the N. which held thus the 17<sup>th</sup>, with cloudy weather, and fill'd the bay with ice from the sea; at night the wind was as before, which continued thus the 18<sup>th</sup>, being a cloudy, but frosty day, but a star-light night. The 20<sup>th</sup> proving a calm fun-shiny day, we went upon the hill, but could discover nothing, (as far as we could see) but ice; the night was cloudy, the wind in the south, which held thus the 21<sup>st</sup>, with dark rainy weather, the ice was all carried out to sea again; the night was cloudy, the wind still in the south. The 22<sup>d</sup> the wind turn'd to the S. E. with thick clouds; for want of refreshments we began to be very heartless, being afflicted with the scurvy to that degree, that our legs were scarce able to bear us; the night was cloudy, and the wind as before. The 24<sup>th</sup> proved a pretty pleasant fun-shiny day; in the afternoon the wind shifted to the S. E. with some snow clouds; the night was exceeding dark. The 25<sup>th</sup> was a fun-shiny and calm day, from morning till night; towards evening a southerly wind produced some clouds, but the night proved clear again and calm. The 26<sup>th</sup> the sea had forced the ice into the

bay again; the day was very bright, the wind at S. E. and S. the night was very clear. The 27<sup>th</sup> the same wind continued with fair and clear weather both day and night. The 28<sup>th</sup> proved a cloudy day, the wind at S. E. The ice was carried so far into the sea, out of the bay, that we could scarce see it. The same day we saw a whale, a huge beast, in the bay, but could not come at him: This day going also over the hill to the *Red-Hill*, we spied from thence five whales near the shore, and towards evening four more in the bay, being ten in all we had seen that day; had we had hands enough, and been provided with instruments for such a purpose, we might have taken as many of these fish, as would have freighted a good fleet immediately, without being obliged to stay for the taking of them after their arrival, as they generally do: The wind and weather was in the night as before. The 29<sup>th</sup> a southerly wind produced a cloudy, but very mild day: Innumerable whales appeared near the shore that day, so that had we not wanted men and tools, we might have made a considerable advantage, which we now durst not so much as attempt, being but seven in all, and disabled by the scurvy: In the night the wind and weather as before, which continued the 30<sup>th</sup>, when we saw abundance of fishes, as we did almost every day after; the night was very dark, the wind as before. The 31<sup>st</sup> it blew a brisk gale from the N. E. with some snow; we got sight of four or five whales again, which came so near the shore, that they were likely to have been cast upon the sands; but if they had, we had not strength enough to have catch'd them: We saw likewise a she bear with three young ones, about the bigness of a small sheep: We did what we could to kill them, but our first shot failing, they all got off, to our grief, tho' it was no unpleasant sight to see the young ones follow the old: In the night the wind and weather as before.

The first of *April* was a cloudy day, the wind at E. We saw four or five whales again at the entrance of the bay, but had only the pleasure of looking at them; the night was star-light, the wind in the south. The 2<sup>d</sup> proved a snowy day, the wind at S. E. but not very cold; the night was dark, the wind as before. The 3<sup>d</sup> the wind turning to the W. produced a cloudy day; there being at this time no more than two of us in health, (the rest being very ill and crippled by the scurvy) we killed the only two pullets we had left, at their request, and they fed pretty heartily upon them, in hopes it might prove a means to recover part of their strength, which was much decayed.

cayed, and which we heartily wished, being sorry we had not been more for their sake: In the night the weather and wind was much the same as before, which continued thus all day and all night. The 4<sup>th</sup> a westerly wind produced a sun-shiny day. The 5<sup>th</sup> we saw two very large whales in the bay; the night was dark, the wind at S. E. The 6<sup>th</sup> it was clear weather, but the night dark, the wind N. E. we saw four or five whales more in the bay; at night the wind and the weather as before, which continued the 8<sup>th</sup>, with cold sun-shiny weather; we saw innumerable whales both at sea and in the bay: In the night the wind and the weather continued as before, and so it did the 9<sup>th</sup>, when we saw abundance of whales again; the night was cold and frosty, the wind at north. The 10<sup>th</sup>, the wind continued the same, with very clear weather; the bay was full of ice, and we saw some whales, in the night the wind and weather as before. The 11<sup>th</sup> we saw neither fishes nor bears, having not seen any of the last these several days; it continued to be very cold weather; in the night the wind as before. The 12<sup>th</sup> the wind turning to the N. E. it proved a very clear frosty day; at night the wind and weather as before, which continued the 13<sup>th</sup>; the bay was full of ice, the night very cold and dark. The 14<sup>th</sup> the wind held still in the same corner, with sun-shine; at night the wind turning to the south, the ice was carried out of the bay, a great way from the shore. The 15<sup>th</sup> proved a calm mild day, we saw four whales in the bay, tho' we don't now stir out so often as formerly, our clerk being very ill; the greatest part of the night the wind was at west. The 16<sup>th</sup> being *Easter-day*, our clerk died, the Lord have mercy upon his soul, and upon us all, we being all very sick; the wind was at W. with a clear day and dark night. The 17<sup>th</sup> the wind continued as the day before, but was very cloudy, the bay was full of ice again; the greatest part of the night weather and wind as before. The 19<sup>th</sup> both wind and weather proved as the day before: and now having not the least refreshment left, we grew worse and worse every day, and that without any hopes of recovery, partly for want of necessities, partly by reason of the excessiveness of the cold; for being scarce able, whilst in health, to keep ourselves tolerably warm, by exercising our bodies, we were but in little hopes of doing it now we were sick, and not able to stir out of our cabins, all our dependence being on God's mercy, the wind and weather as before. The 20<sup>th</sup> proved a cloudy day, the wind at S. we saw the ice forced a great

way to the N. at sea, the night was snowy, with an easterly wind. The 21<sup>st</sup> was a bright calm and sun-shiny day, but we could make but slender observations, being not able to stir from our huts, by reason of the scurvy, which encreases upon us every day; the night was cloudy, the wind at N. E. which continued thus the 22<sup>d</sup>; the ice was forced so near the shore, that we could scarce see any water; at night a south wind carried the ice quite out of sight again. The 23<sup>d</sup> the wind blew from the same corner with small rain; we were by this time reduced to a very deplorable state, there being none of them all, except myself, that were able to help themselves, much less one another; so that the whole burthen lay upon my shoulders, and I perform my duty as well as I am able, as long as God pleases to give me strength: I am just now a going to help our commander out of his cabin, at his request, because he imagined by this change to ease his pain, he then struggling with death, the night was dark, and the wind as before. The 24<sup>th</sup> was a cloudy day and night, the wind at S. which continued the 25<sup>th</sup> with some sun-shine: The ice kept about half a mile from the shore to the north-side, but on the south-side of the same bay, no ice was to be seen. We had sight of many whales again; the night was dark, with a strong N. W. wind; the ice was forced nearer to the shore, tho' there remained a good interval of water betwixt both; the wind and weather as before. The 26<sup>th</sup> it was a calm, but cloudy day, the night fair, the wind at W. The 27<sup>th</sup> it was thawing weather: That day we kill'd our dog for want of other refreshment; the night was cloudy, yet without rain, the wind at E. which continued thus the 28<sup>th</sup>, with cloudy weather: The ice was this day carried to sea, quite out of sight; the night was cloudy with a strong N. wind. The 29<sup>th</sup> the wind and weather as before, but turn'd to blow hard from the N. E. at night. The 31<sup>st</sup> was a clear sun-shiny day, with the same wind: [*Die*] *Memorandum*. This word *DIE*, was the last, questionless he writ, intending probably to set down afterwards his observation concerning the night, according to his usual way. This person being one, who (according to the report of others) had learned to write of the other six, he writ as long as he was able, viz. to the last day of *April*; when perhaps, being seized by a fainting fit, he was forced to retire to his cabin, where he delivered up his soul to his creator, as will appear more fully by the following additions.

**A**Mong all the ships that were sent the next year from *Holland* to *Greenland*, those of *Zealand* being the first that came in sight of the isle of *St. Maurice*, some of the seamen being eager to know what was become of their comrades, went ashore in a boat, striving who should be the first to come to their huts, tho' by their not appearing upon the sea-side, they did not preface any good to themselves. They were no sooner entered the hut, but they found they were not deceived in their guests, every one of the poor wretches, left there last year, lying dead in their cabins, the news whereof they brought to their commander.

The first of these seven unfortunate fellows, died the 16th of *April* 1634, whom they had put in a coffin, and deposited in one of the huts. The other six died in the beginning of *May*, as we believe by the conclusion of the journal at the end of *April*.

The before-mention'd ships of *Zealand* came to an anchor in the bay of *St. Maurice's* isle the 4<sup>th</sup> of *June* 1634, where they found the dead carcases of these unfortunate wretches, each in his own hut; near one of them stood some bread and cheese, upon which probably he had fed not long before his death; another had a box with ointment by his cabin-side, wherewith he had rubb'd his teeth and joints, his arm being still extended to his mouth; there also lay a prayer-book near him, wherein he had been reading; the rest being found each in his cabin.

If we seriously reflect upon the condition of these wretches, it must needs have been very miserable, especially after all were fallen sick, so as not to be able to assist one another; especially in respect of him that out-lived the rest, being the same, who according to his own testimony, attended them to the last; and had learn'd to write from the others, as did appear by his hand-writing, till the conclusion of the

journal, who, as we guess, lived some days after he left off writing; it being very probable, that some might grow sooner stiff, by the excessive cold, than others, in proportion of the quantity of natural heat they had left; tho' it is beyond all question, that the source of their distemper was the scurvy, occasioned by their salt food, without any manner of refreshment, which having put the cramp into their limbs, and rendered them incapable of exercise, they soon grew quite stiff, and were quite overcome by the cold; it being certain, that without the scurvy they needed not have dreaded the cold, which was not so excessive, but that once within three or four days they could stir abroad, after the snow was a little settled.

Our commodore had no sooner received the dismal news from the seamen that had been ashore, but he order'd the six dead carcases to be put in coffins, and to be buried with the seventh under the snow, till the ground should become more pliable; which being done, they were afterwards, viz. on *St. John's* day, honourably interr'd (according to the circumstances of time and place) under a general discharge of the cannon of the whole fleet.

It is furthermore left to the consideration of the courteous reader, that he was appointed clerk for this design, having never been in that station before, his want of ability ought to plead strongly for the simplicity of these observations; which having (at the request of some friends) been put to the press, were published, and made as intelligible as the nature of the matter would allow of, without imposing upon the publick, which has been done with the utmost sincerity, after the true original, which still remains in my custody, in opposition to divers fabulous relations, which have been published upon the same subject.

A SHORT

A SHORT  
JOURNAL  
OF

Seven other SEAMEN, who being left in 1634,

AT

SPITZBERGEN,

To pass the Winter, died there in 1635.

IN the year 1633, seven persons being left much at the same time as well at *Spitzbergen*, as in the isle of *St. Maurice*; the ships that were sent thither in 1634, had orders from the *Greenland* company, to release those that had stay'd there, and to leave in their room seven others, who should offer their service for that purpose. Accordingly the following seven were (with their consent) appointed to remain the next following winter at *Spitzbergen*; *Andrew Johnson* of *Middleburgh*, *Cornelius Thyffe* of *Rotterdam*, *Jerome Carcoen* of *Delfts-Haven*, *Tiebke Jellis* of *Friseland*, *Nicholas Florison* of *Hocm*, *Adrian Johnson* of *Delft*, *Fetije Otters* of *Friseland*.

These being provided with all manner of necessaries, as meat, drink, physical preparations, herbs, &c. were left ashore to continue all the winter there; during which time, they kept a journal of all remarkable occurrences; the chief heads whereof I thought only fit to insert here, leaving out the more unnecessary observations, such as of the wind and weather, &c. to avoid prolixity. The 11<sup>th</sup> of *September* 1634, the ships being sail'd thence for *Holland*, they got sight of abundance of whales, at whom they discharged their guns, but could not take any; they went also in search for green herbs, foxes and bears, but met with none. The 20<sup>th</sup> or 21<sup>st</sup> of *October*, they had no more sight of the sun. The 24<sup>th</sup> of *November* the scurvy beginning to appear among them, they search'd very earnestly after green herbs, bears and foxes, but to their great grief could find neither of them; so they comforted one another with hopes that God would provide for them something or other for their refreshment. The 2<sup>d</sup> of *December* *Nicholas Florison* took a dose

of a scorbutic potion, and they set some traps to catch foxes. The 11<sup>th</sup>, *Jerome Carcoen*, took such another potion; and they resolved for the future, every one to eat separately from the other, some being not so much afflicted with the scurvy as the rest. They went often in quest after some refreshments, but meeting with none, they recommended themselves to God's providence. The 12<sup>th</sup> *Cornelius Thyffe* did likewise take a medicinal potion against the scurvy. The 23<sup>d</sup>, as the cook was throwing out some water, he saw a bear just by the hut, but he run away at the noise, before they could come at their guns. The 24<sup>th</sup> they discovered another bear; three of them advancing towards him, he rose upon his hindmost legs, and being shot through the body by one of our guns, he began to bleed and to roar, and to bite one of our halberts with a great deal of fierceness; but finding us too hard for him, he betook to his legs; being excessive eager after some fresh meat, (of which we stood in great need for the recovery of our health) we pursued him with lanthorns and candles a great way, but to our sorrow could not overtake him; which made us say to one another, that in case we were not supply'd by God's peculiar providence, with some refreshments speedily, the pain we endured must needs kill us before the return of our ships; but God's will be done. The 25<sup>th</sup> *Cornelius Thyffe* took another potion against the scurvy, being in a deplorable condition. The 14<sup>th</sup> of *Jan.* *Adrian Johnson* of *Delft* died, being the first of the seven, tho' the other six were full of pain, and very ill. The 15<sup>th</sup> *Fetije Otters* died likewise; and on the 17<sup>th</sup> *Cornelius Thyffe*, being the man of all the rest, in whom they had

had put their most hopes next to God. The remaining four were very weak, and had scarce strength left to stand upon their legs, yet they made shift to make coffins for these three, and put their bodies into them. The 28<sup>th</sup> they saw the first fox, but could not take him. The 7<sup>th</sup> of February they had the good fortune to take a fox, to their no small satisfaction, tho' in effect they were too far gone to receive any benefit thereby.

They saw many bears, three or four, nay sometimes six or ten together, but had not strength enough to manage their guns; or if they had had, they could not have pursued them, being not in a condition to set one foot before another. They not even to bite their biscuits, for they were seized with most cruel pains, generally in their loins and belly, which came generally with the cold; one did not bleed, and another was afflicted with the bloody flux. *Jerome Carcoen* was still something better than the rest, being still able to fetch them some fowl for firing. The 23<sup>d</sup> they began to be so weak, that they kept close in their cabins, recommending themselves to God's mercy. The 24<sup>th</sup> they saw the sun again, which they had not seen since *October* 20 or 21 in the preceeding year. The 26<sup>th</sup>, being the last day (as we guess) they were able to write, and lived not long after; they left this following memorial behind them: Four of us that are still alive, lie flat upon the ground in our hut; we believe we could still feed, were there but one among us that could stir out of his hut to get us some fowl, but no body is able to stir for pain; we spend our time in

constant prayers, to implore God's mercy to deliver us out of this misery, being ready whenever he pleases to call us; we are certainly not in a condition to live thus long without food or fire, and cannot assist one another in our mutual afflictions, but must every one bear our own burthen.

When the ships from *Holland* arrived there in 1635, they found them all dead, shut up close in their tent, to secure their dead bodies against the bears and other ravenous creatures. This being the tent of *Middleburgh*, a baker who got a shore first, happened to come to the back door, which he broke open, and running up stairs, found there upon the floor, part of a dead dog that was laid there to dry; but making the best of his way down again, he trod upon the carcass of another dead dog (for they had two) at the stair foot in the buttry. From hence passing thro' another door, towards the fore-door, in order to open it, he stumbled in the dark over the dead bodies of the men, whom they saw, (after the door was opened) altogether in the same place, viz. three in coffins, *Nicolas Florison* and another, each in a cabin, the other two upon some sails spread upon the floor, with their knees drawn up to their chins. Coffins being ordered to be made for the four that had none; they were buried with the other three under the snow, till the ground becoming more penetrable, they were buried one by another, and certain stones laid upon their graves, to hinder the ravenous beasts from digging up their carcasses: These were the last that pretended to pass the winter at *Spitzbergen*.

A TRUE

A TRUE and SHORT

# ACCOUNT

OF

FORTY TWO PERSONS

Who perished by shipwreck near

# SPITZBERGEN,

In the year 1646.

**J**OHN CORNELIUS of *Muniken*, being ordered to *Spitzbergen*, to catch whales, he set sail from the *Texel* in a galliot, the 6<sup>th</sup> of May 1646, and arrived the 3<sup>d</sup> of June following near *Spitzbergen*, with an intention to anchor in the bay, but was by the vast floats of ice-shoals forced to keep out at sea. After having in vain cruized up and down among the ice-shoals, they got into the bay, but perceiving two whales farther at sea, they sent out their sloop in pursuit of the whales.

Whilst they were rowing up and down to watch the motion of these creatures, they discovered at a distance a great ice-shoal, with something white upon it, which at first sight they imagined to be bears, (they being generally white here;) but one *Ellert Johnson*, (who was in the sloop to manage the harpcock or iron wherewith they strike the whale) judging by the motion that it was something else, persuaded them to row that way, which being done accordingly, they not long after perceived the same to be a piece of a rope belonging to the sails of a ship, which was held up by a man as a signal of their utmost distress; so they rowed up to it with all the oars they had, and coming near them, found (to their great surprize) four living men, and one dead one, (all *Englishmen*) upon the ice-shoal, who upon their bended knees expres'd their joy and thankfulness for so unexpected a deliverance from the jaws of death. They were taken into the sloop, and carried into the bay aboard the ship.

VOL. II.

They had cut a great hole, in the nature of a subterraneous cave, into the ice, and round the entrance thereof had placed the pieces of ice that were cut out of the concavity, to defend themselves against the violence of the winds and waves. In this hole they had spent four or five days, (it being so long since they had lost their ship.)

At first there were in all forty two of them, and they had saved some victuals and tools with their sloop. The commander perceiving, after a little while, that it was impossible for them to hold out long upon the ice-shoal, resolved to go ashore in the sloop, with seventeen of his men, if he could, and to send them word afterwards, how matters stood there. This was done accordingly, but it blowing very hard, and they having not heard the least tidings of them since, they were afraid that they were drowned before they reached the shore.

There were then twenty four left upon the ice-shoal, but the want of provisions encreasing daily among them; and they being reduced to a starving condition, and expecting nothing but present death, resolved to divide themselves, and to get upon several other ice-shoals, in hopes by some chance or other, to come near to the shore; but whether some of them got ashore, or whether they were taken up by some ship or other, or whether they were swallowed up by the merciless waves, they were not able to tell.

5 E

Certain

Certain it is, that we found four of them (the miserable remnants of forty two) sitting together upon this ice shoal, overwhelmed with affliction, without any hopes of being saved, from the last extremity they were reduced to by frost and hunger, before we came in full sight of them with our sloop, having had nothing to feed upon for some time, but a leather-belt, (belonging to one them) which they had divided and eat, share and share alike, till all was consumed.

After they were brought to our ship, our surgeon took all imaginable care for their recovery; notwithstanding which, three of them died in a few days after, so that of forty two wherewith their ship was manned, no more than one escaped with life, who arriving in September 1646, in the galliot the *Delft* upon the *Meuse*, from thence return'd to his native country in *England*.

*Monfieur de la MOTHE de VAYER.*

S I R,

**P**Urfuant to your request, I am going to give you the best account I am able of what I could learn concerning the condition of *Ifeland* and *Greenland*, during our stay in the north. As nothing is more agreeable to my sentiments than to serve you to the utmost of my power, so I will treat of both one after another.

*Ifeland* is a large isle, and *Greenland* of a vast extent: I will begin with the first, and give you an account of all the most material passages I have met with concerning it, in their best authors, especially in *Angrim Jonas*, (erroneously call'd *Arngrim* by some) and by conversing with several persons of note and learning in *Denmark*; upon which score I am particularly obliged to *Olaus Wormius*, a doctor of physick of *Copenhagen*, a person very curious in all the affairs of the north. I will also not pass by in silence, what I have read in *Bleskenius*, a *Dane* by birth, and who has been in *Ifeland* himself, at least as far as relates to those things he has been an eye-witness of; for which I have the same regard, as for what *Herodotus* assures us to have seen with his own eyes; it appearing very improbable to me, that men of honour and learning should be so careless of their reputation, as to impose things upon the world, never seen by them, under a false notion of their own experience. To be short, I will follow the footsteps of *Salust*, and rehearse to you what I have either read in *Bleskenius* or *Angrim Jonas*, or heard from *Dr. Wormius* and others, upon whose authority we are obliged to rely in this point.

The isle of *Ifeland* lies in the *Deucalido-*

*nian* ocean, at 13 deg. 30 min. longitude, and 65 deg. 44 min. latitude, according to the elevation taken in the bishoprick of *Hole*, the most northern part of the isle, as *Angrim Jonas* tells us in his *Crimogea*; adding, that he had the same of *Gundebrand de Thorslac*, bishop of *Hole*, his familiar friend, and once a disciple of the famous astronomer *Tycho Brahe*.

*Ifeland* is to the east washed by the *Hyperborean* sea, and on the south side by the *Deucalidonian* sea; to the west it lies opposite to *Greenland*, towards the cape *Farewell*, and on the north side is inclosed by the frozen sea of *Greenland*. Its length from east to west, is computed to be twenty days journey; and its breadth, where it is broadest, at four days journey, from the south to the north. But *Angrim Jonas*, who has given us this account, does not mention whether these days journeys are to be perform'd on foot or on horseback.

It is generally believed to be twice as big as the isle of *Sicily*; and by its elevation and the globe, you will soon be convinced of the truth of what I am going to tell you, *viz.* That about the summer solstice, whilst the sun is in the *Twins* and *Cancer*, the sun does never go entirely below the horizon for two months, in the north of *Ifeland*; but some part of it remains above it, and one half of it whilst the longest days last, from ten at night till two in the morning, when it rises quite above the horizon; whence it appears, that about the winter solstice, whilst the sun is in the signs of *Sagittary* and *Capricorn*, the whole body of the sun does for two months successively not rise above the horizon; and in the shortest days not above half

half of it, from ten a clock in the morning till two in the afternoon, the ordinary time of sun-set here at that season.

This isle has got its name from the whiteness of its ice, *Quasi Island*; it was formerly reputed fertile in wheat, and well stored with wood, fit for the building of large ships; the roots whereof being of a vast bulk, are to this day found underground where these forests stood, and are as black as ebony-wood. But now-a-days *Island* produces no wheat, nay not so much as a tree, except some few shrubs. And were it not that they are furnished with grain from the neighbouring countries, and supplied with sufficient quantities of wood, both for fuel, and their buildings, (which are like those of other parts in the north) by the ice, which in the month of *May* is, together with the wood, forced from the more northern parts on this shore, they must perish with hunger and cold. In their building they also make use of the bones of whales and other great fishes; and for firing, of two sorts of turfs, (or *Cepes Bituminosus*, called *Gleba Fossilis* by *Angrim Jonas*) which they dig and dry in the sun. These shoals of ice, which come from the north thither, bring along with them such vast trunks of trees, that according to the *Island* chronicles, a tree was carried thither of sixty three cubits long, and seven in compais.

For no sooner come the ice shoals from the north to the *Island* coast, but the inhabitants go in quest of these trees, and of several beasts, which are carried along with it thither; such as white and red foxes, stags, wolves, white and black bears and unicorns. For that fine and large horn preserved in the king of *Denmark's* palace at *Fredericksburgh*, (the *Fontainebleau* of that kingdom) belonged to a fish taken upon the ice near *Island*; it is much larger than that of *St. Denis* in *France*. Count *Ulfeld*, great marshal of *Denmark*, shew'd me another of these unicorns, which was entire, but not above two foot long, likewise taken upon the ice near *Island*; he told me, that when he first had it, there was to be seen still part of the flesh and skin.

*Island* is a strong and mountainous country: their pastures are of such goodness, that they are fain to remove the cattle for fear they should burst themselves; the grafs having so agreeable a scent here, that foreigners transport and dry it, to lay it among their linen. However, their beef is not reckoned of the best sort, and their mutton is rank; which the *Islanders* don't much regard, because they dry their meat in the sun and wind, which preserves it better than salt, and takes away much of

its rankness. Butter they make in abundance, and keep it in tubs, or for want of such, only pile it up in the house. Their ordinary drink is milk or whey, sometimes with water, sometimes without. They don't want good horses; these feed during the winter upon dry'd fish, as well as their oxen and sheep, when hay begins to fall short: Of these dry'd fish they also make flour and bread, when by the rigour of the winter season, they can't sometimes be supplied with grain from abroad.

*Island* is full of clear and fine springs, the water whereof is not only very wholesome to drink, but some of them have also a nourishing quality like beer: they are also not destitute of hot springs for bathing; of ponds and lakes, they have great abundance, which furnish them with great quantities of fish; as also great numbers of brooks and navigable rivers, the names whereof, as well as of their bays and capes, I will not insert here, they being to be found in other authors.

*Bleskenius* tells us of a certain lake in the western part of the isle, which always smoaks, and yet is so cold, that it petrifies every thing that is put into it; for, says he, if you put a stick into the ground near it, the stick changes into iron as far as it is under ground; as far as it lies under water it turns into stone, and that part above the water remains wood as before. *Bleskenius* says, he saw this try'd twice, and that part which seem'd to be iron, being put into the fire, it burnt like charcoal. He also tells us of another lake in the middle of the same isle, the exhalations whereof are so malignant, that they kill the birds in an instant that fly over it. This lake seems to be of the same stamp with the *Avernus* of the Greeks mentioned by *Virgil*, lib. 6. *Æneid*.

*Quam super band ullum poterant impune volantes*

*Tendere iter pennis: tali sese balitus atris  
Faucibus effundens, supra ad convexa ferebat:  
Unde locum Graji dixerunt nomine Aornum.*

*Bleskenius* adds, (besides what *Angrim Jonas* relates of the hot springs of *Island*) that certain springs are so hot here, that the water thereof burns the skin; and after it is set to cool, it leaves a sulphur upon its surface, as the sea water leaves a saline substance in the salt pits. Upon the surface of the water of these springs, swims also a certain red substance, which plunges under water as soon as you come near it, but no sooner do you turn your back, but it appears again above water. The same author assures us, that in a certain place of

this isle, named *Turlekbaven*, there are two fountains or springs, one very cold, the other excessive hot; the waters whereof being conveyed by two different pipes or channels, and mix'd together in one trunk or basin, make a convenient and most excellent bath. Near it (says he) is another spring, the water whereof having the taste of wheat, is a good remedy against the venereal distemper, which, according to *Bleskenius*, is very common here.

*Iceland* affords not any mines of metal or minerals, except brimstone, whereof there is abundance in most parts of the isle, but especially in the mount *Hecla* in the east of the isle, extending towards the south, and which sometimes appears all in flames like mount *Vesuvius*. *Bleskenius* says, that mount *Hecla* not only sends forth flames, but also whole torrents of sulphureous liquor, which burns like spirit of wine: sometimes these eruptions are followed by vast quantities of black ashes and stones. These eruptions cease commonly with a west wind, which makes the inhabitants living thereabouts, who know the avenues of the mountains, to chuse that time to go to the top of it, and throw great stones into the hole, through which the flames break forth: it being otherwise very dangerous to approach so near it, there being divers instances that men have been swallow'd up by the earth that has given way as they were going up the mountain.

It is a received opinion among the *Icelanders*, that this mountain is the place where the souls of wicked persons are tormented with fire; for they will tell you, that they see sometimes whole troops of infernal spirits carrying the damn'd souls into the abyss of this mount, and returning back again to fetch more. *Bleskenius* says, this is generally observed after some bloody battle has been fought in some place or other. Thus the *Icelanders* believe, that the noise which arises from the many sea shoals forced against the shore, are the groans and lamentations of the damn'd souls, by reason of the excessive cold they endure; it being their opinion, that some souls are condemn'd to suffer eternal cold, as well as everlasting fire.

The same *Bleskenius* tells us, that whilst he was in *Iceland*, there arose so prodigious a fire about midnight in *November*, on the sea near the mount *Hecla*, that it was seen all over the isle, to the no small astonishment of the inhabitants; the most sensible among whom were however of opinion, that the same proceeded from mount *Hecla* itself. Within an hour after they perceived an earthquake all over the isle, which was followed soon after by so dreadful a noise,

VOL. II.

(like a thunderclap) that every one expected the day of judgment to be at hand. Some few days after, the sea was found dry near the place where the fire had appear'd, and was retreated at least two leagues within its old bounds from the shore.

As the use of corn is unknown among the *Icelanders*, so they neither buy nor sell; but what commodities are brought to them, such as flour, beer, wine, strong-waters, iron, woollen and linen cloths, &c. they exchange for the products of their country; such as dry'd fishes, butter, tallow, coarse woollen cloths, brimstone, foxes, bears, stag and wolves skins. *Bleskenius* says, that the *Germans* who traffick thither, set up their tents upon the shore, where they expose their commodities, as cloaks, shoes, looking-glasses, knives, and such like toys, which they exchange for what the *Icelanders* bring to them. He further adds, that the young women of *Iceland* (who are handsome enough, but miserably clad) come to these strangers to prostitute themselves for some bread, biscuit, or some other trifle; nay, their fathers often carry them to these foreigners, and look upon it as a lucky chance, if they happen to be with child by them; they being afterwards in greater esteem among, and sooner married by the *Icelanders* than others.

So soon as an *Iscander* has bought (or rather exchanged) some wine or beer from these strangers, he invites his kindred, relations, and friends, to make merry with him; when they seldom part as long as any strong liquor is left. During the merriment, they sing the achievements of their ancient warriors, but without any art, order, or rule. It is accounted a singular piece of ill breeding among them, to go away from the table to piss, whilst they are drinking. The young wenches (who as I told you are not ugly) commonly creep under the benches, to reach them the chamber-pots.

*Angrim Jonas* is very angry with *Bleskenius* upon this account, and accuses him of falshood, in reflecting upon the reputation of his countrey-women, and accusing them of barbarity; as also, in regard of what he says concerning their washing their mouths and teeth every morning with their own urine, tho' the same has been observed in the *Celtiberians* by *Catullus*:

*Nunc Celtiber in Celtiberia Terra,  
Quod quisque minxit, hoc sibi solum mane  
Deniem, & russam defricare Gingivam.*

To tell you my opinion upon this matter; it's possible the *Icelanders* are not now so barbarous as formerly, tho' it may rati-

5 F nally

nally be supposed, that a nation living so near the north pole, may not be so refined and polished as some others, especially among the vulgar sort, for people of fashion ought to be exempted of this rule (less or more) in most places.

*Blefkenius* assures us, that the *Icelanders* have familiar spirits, who attend them like servants, and give them notice from time to time when they shall be successful in hunting or fishing. *Ortelius* adds, that they call these dæmons or spirits *drolla's*; which seems to have some reference to the *Danish* word *troll*, which signifies a devil. *Blefkenius* further tells us, that the *Icelanders* sell what wind they please to strangers. *Angrim Jonas* ridicules this story called *Ging*, that the *Iceland* seamen being very expert in discerning in the evening, by the disposition of the air, what wind is likely to blow the next day; which if they find suitable to the wish of such strangers as lie ready to sail near the shore, they pretend to sell them such a wind, which (to cover the deceit) they do thus: They ask the stranger to give them his handkerchief; which done, they pretend to mutter certain words into it, and immediately after tie it into knots, for fear the words should evaporate into the air. Afterwards he returns him his handkerchief thus knotted, with a strict charge to keep it thus with extraordinary care, till he arrives in the desired port: sometimes it happens, that the wind proves according to wish, but much oftner it proves quite otherwise. So soon as the poor stranger is got out to sea, if he be overtaken by a tempest, he is put to no small nonplus what to do, imagining that he carries the devil in his pocket, and consequently thinking it a point of conscience to keep it, yet is unwilling to part with it. If, says *Angrim*, once in a great many times the wind proves according to what the *Iscander* has foretold the stranger, this is a sufficient precedent in opposition to many other experiments made to the contrary; the person who fancies to have bought his favourable wind, not failing to tell it where-ever he comes, that with the assistance of the wind he purchased in *Iceland*, he was happily carried to the desired port.

Tho' such like stories are not likely to make any impression upon men of judgment, they may serve for variety's sake, there being some pleasure in understanding what is said and believed by other people. *Blefkenius* tells us also, that there are forcerers in *Iceland*, who can stop a ship under full sail; against which (says he) they make use of certain ill-scented suffumigations, (described by him) as counter charms, by vir-

tue of which they force the dæmon that retains them, to let the ship pursue its former course. But it's time to return to more serious matters relating to the history of *Iceland*.

*Iceland* was in ancient times divided into four provinces, according to the four corners of the world; each whereof was subdivided into three bailliages, called *reps* by the *Icelanders*, except the northern province, which being the largest and most considerable of all, had four bailliages, each of which was again subdivided into six, seven, eight, or ten districts or judicatures, in proportion to their extent. Every year there was an assembly held of the bailliages in each province, who were convened by certain small crosses of wood, sent by the governor of the province to his respective bailiffs, who were to distribute them among the judges, and these among such of the heads of families, as had a right to appear at this assembly. Besides which, the lord chief justice, or president of the whole isle, who being the interpreter or conservator of the laws of the land, who was also considered as the sovereign of the four provinces, used at certain times to call together the general estates of the whole isle; which was done by four wooden hatches, sent to the four governors of the provinces.

Each bailliage had three principal *pagodes*, or pagan temples, for the administration of justice, and their devotion; whence the office of bailiff was honoured with the surname of *godorp*, i. e. *divine*. The principal care of these bailiffs was to provide for the poor, whereof there were great numbers in so desolate a country; to take care that the poor of one *rep* did not go thence to another; and to refrain the licentiousness of sturdy beggars, against whom the laws were very severe; for they had liberty to kill, or to emaculate them, to prevent their multiplication. They had also a law, forbidding (under pain of banishment) not only a poor fellow to marry a poor woman, but also any man, who had but just enough for his own sustenance, to marry a woman without something to maintain herself.

This aristocratical form of government, and manner of administering justice, continued in this isle till the year of *Christ* 1263. when the kings of *Norway* conquered the said isle, and forced them to pay them an annual tribute; being invited thereunto by the intestine broils arisen among the great ones, about the administration of the government. The kings of *Denmark*, after having made themselves masters of *Norwegen*, did send into *Iceland* their governors

or viceroys; from which time on, they had nothing but the shadow left of their antient liberty. These governors have their residence in a certain castle, called *Besfat*, seated in the western part of the isle. They are however not obliged to reside there constantly, unless in case of necessity, and when they gather the yearly tribute, which is paid in the same commodities I had occasion to mention before, and which they exchange with strangers; which serve in some measure the king of *Denmark* to provide his navy with provisions, and clothing for the seamen.

The last viceroy, or governor of *Iseland* (since our coming into the north) was Mr. *Prosmoel*, admiral of the *Danish* fleet, lately defeated by the *Swedes* in the *Baltick* sea. The admiral fought with incredible courage, and died upon the deck of his ship with sword in hand, having refused to accept his life from the hands of his enemies.

*Angrim Jonas* dates christianism in *Iseland*, from the thousandth year after the birth of Christ; not but that there were christians there a considerable time before; but that paganism was not absolutely abolished till that time. The *Islanders*, whilst pagans, did, besides other gods, adore *Thor* and *Odin*. The first was to them instead of *Jupiter*, and *Odin* in lieu of the *Mercury* of the ancient *Greeks* and *Romans*. Hence they call to this day their Thursday *Thorfsday*, and their Wednesday *Odin's Daguir*. The altars consecrated to their gods were covered with iron plates, upon which they kept an everlasting fire. Upon the altar stood a certain vessel of tin, containing the blood of the sacrifice, wherewith they besprinkled the spectators. On one side of this vessel lay a silver ring, of about twenty ounces weight, which they used to besmear with the blood of the sacrifice, and lay their fingers upon it when they were to take a solemn oath. The chronicles of *Iseland* tell us, that they used to offer sacrifices of men to their idols. These they threw down from the rocks, or into deep pits made for that purpose near the gates of their temples. The pagan *Islanders* had their two principal temples, one in the north, the other in the south part of the isle. In lieu whereof the *Iseland* christians have erected two, and the only two bishopricks in these parts of the isle, viz. that of *Hole* in the north, and that of *Scalbold* in the south. They at present profess the *Lutheran* religion, as well as in *Denmark*.

The antient *Islanders* were tall, and well made, robust, nimble, and active, famous gladiators, and much addicted to pyracies. *Monomachies*, or single duels, were publicly allowed among them; nay, even

their law-differences were decided by duels, the vanquished losing their pretensions, as did likewise he who refused to accept the challenge, and was used in the same manner as if he had been vanquished. This was the chief method of acquiring possessions among them; for, if two gladiators entered upon a single combat, the conqueror became by his victory master of the whole estate of his conquered enemy, against which his heirs had but one remedy, which was to bring a large bull or ox to the conqueror, which he was to kill with one stroke, which if he fail'd to do, he lost his whole pretension upon the estate of his conquer'd adversary.

Besides that the *Islanders* were very strong and courageous, they had also a sufficient share of wit, and were so curious in their annals, that they not only carefully preserved their own history from oblivion; but also embellished the same with the most memorable transactions that happened in the neighbouring kingdoms. Hence it is, that *Angrim Jonas*, in his *Specimen Islandicum*, speaking of his countrymen, calls them *ad totius Europæ res historicas lynciæ*, i. e. quicksighted in the whole history of *Europe*. Certain it is, that *Saxo Grammaticus*, in his preface to his *Danish* history, confesses to have made use with good success of the memoirs taken out of the *Annals* of *Iseland*, called *Tylenfes*. Dr. *Wormius*, I remember, told me concerning these Annals, that they were curiously written, and contained many exquisite matters (not to be found elsewhere) relating to the isles of *Orcades*, the *Hebrides*, *Scotland*, and *England*, nay, even in the dukedom of *Normandy*: The reason whereof might probably be, that these *Islanders* were very powerful in the *Deucalidonean* or *Scots* sea, and perhaps carried from thence their commerce as far as *Normandy*.

The most antient histories of *Iseland*, and such as are most in esteem among them, were written in verse; it being observable upon this head, that the antient kings and heroes of the north used constantly to carry some poets along with them to the wars, who used to celebrate their histories in verse. These were sung by the soldiers in their armies, and consequently divulged in the adjacent countries. The *Islanders* were so famous for their poetry among the neighbouring nations, that it was generally believed that there was a certain kind of magic hidden in their verses, whereby they could summon the dæmons from the infernal regions, and change the influence of the planets. Their poets are born, and not made such; for the most ingenious person among them cannot write a verse, without his natural genius prompts him to it, the rules of their

their poetry being most strict and severe; whereas such as are endowed with this qualification by nature, write them with such facility, that they can speak scarce any thing but in metre. They are commonly seized with this poetical frenzy in the new moon, when their faces appear dreadful, with a pale countenance, and hollow eyes; not unlike as the sybil of *Cume* is described by *Virgil*. At that time it is very dangerous to converse with these furious fellows, the wound given by a mad dog being scarce more dangerous than their venomous satires.

I cannot forbear to tell you what *Dr. Wormius* related to me upon this head: Some years before, when he was *rector magnificus*, (or vice-chancellor of the university of *Copenhagen*) a certain young student, a native of *Iceland*, made his complaint to him against one of his countrymen, who, as he said, had most highly affronted him in one of his satires. *Wormius* having sent for the poet, he did not disown the poem, but denied that it was intended against his countryman; and in effect, the vice-chancellor, according to the knowledge he had of the *Iceland* tongue (being a dialect of the ancient *Runic* language) could not find out any great reason of complaint in the said poem. The plaintiff, finding the vice-chancellor inclinable to his adversary's side, burst out into tears; telling him, with a mournful countenance, that if he did not assist him, he was lost for ever. Then rehearsing to him the fables, figures, and other malicious designs, under which the malignity of this satire was couched; he further told him, that he must be looked upon as an infamous person in his country, if this poem should ever come thither; that all his welfare lay at stake; nay, that the malicious design of it reached even his life, and that the charms contained therein would pursue him, and have their effects upon him wherever he went. *Dr. Wormius*, not a little moved in compassion, when he saw him in this agony, took the poet aside, representing to him the duty and charity of a christian, and likewise the severity of the *Danish* laws against forcerers; with severe threats to deliver him into the hands of justice, if the other should happen to fall sick, tho' only out of fear: Which made such impression upon the poet, that at last he confessed the malicious design of his satire, tore it to pieces, and promising never to write it, or speak of it again, embraced the young student, who was ravished with joy, because he had made his peace with the poet.

The *Iceland* poets have a certain mythology or explanation of their fables, called

76. Edda. Edda. Among other matters, they sup-

pose a certain giant, named *Immer*, the first principle of things. They say, that the chaos produced dwarfs, who getting upon the giant, took him to pieces. Out of his skull they made the heavens, out of his right eye the sun, out of his left the moon, out of his shoulders the mountains, the rocks of his bones, the sea of his bladder, and the rivers of his urine; and so with the other parts of his body: Whence it is, that these poets call the heavens *Immer's* skull, the sun his right eye, the moon his left eye, the rocks his bones, the mountains his shoulders, the sea his bladder, the rivers his urine, and so forth. *Dr. Wormius* did shew me a very antient copy of this *Edda*, written in the *Iceland* tongue by an *Iselander*, and interpreted it to me, whence I have taken what I have related to you now.

If we may believe the *Icelanders* annals, they used in former ages to be so formidable at sea, that both the kings of *Denmark* and *Norway* were jealous of their naval strength; whereas now they have no wood enough to build a fisher-boat. They formerly traffick'd into all the circumjacent countries, whereas now they scarce ever leave the isle, unless some few of them who come to *Copenhagen* to study, and are generally so eager to return to their native country, that there is not so much as one instance to be given of their staying in *Denmark* afterwards, tho' good livings have been offered them there, there being some among them who have applied themselves to their studies with very good success. They are so bigotted to their misery, that whatever you tell them concerning the advantage of the *Danish* climate beyond theirs, has not the least effect upon them. There were at that time about fourteen or fifteen students at the university of *Copenhagen*, who were generally speaking of a low stature, and slender; tho' I remember, *Blefkemius* says in one place, that he saw an *Iselander* in *Iceland* of such a prodigious strength, that he could lift a *Hamborough* barrel of beer (holding forty-eight gallons) to his mouth.

The *Icelanders* retain to this day some relics or rather a shadow of their antient government; their laws being now so interwoven with those of *Norway* and *Denmark*, that whilst they are fond, not quite to part with their own, and at the same time are obliged to obey the others, they entangle themselves into no small difficulties concerning the concordance betwixt their and the *Danish* laws; which has made *Angrim Jonas* say, that there are as many *Pantimies* in the laws of *Iceland*, as there are *Antinomies* in the *Roman* law.

The *Icelanders* retain to this day their antient

this day their an-  
tient

tient custom of building their houses at a considerable distance from one another, without any order or rule, for fear of fire, being all of wood: They have no other windows but a hole on the top; their houses being very low, and sometimes half under ground, by reason of the high winds that often blow here. They are commonly covered (like those in *Sweden*) with the bark of beech-tree covered with turfs, much after the same manner as *Virgil* describes the hut of *Tityrus* in his *Bucolics*:

*Pauperis & Tuguri congestum cespite culmen.*

These are their dwelling-houses, wherein they live to a hundred years of age, and more, without making use of any physick or physicians.

The whole isle of *Island* has no more than two villages, which are the seats of their two bishops, viz. *Hole* and *Schalbolt*; the first whereof, being the biggest, has only a few houses; and as they have neither towns nor villages, so they have no highways; which obliges those that travel here from one province to another, to make use of the needle and compass (as they do at sea) for their guide; and near those pits or holes, which by reason of their being filled with snow, might prove dangerous to travellers, they set up marks to warn them of the danger. The *Islanders* seldom inhabit but near the sea shore, or near a river, for the conveniency of fishing and pasture, so that the inland country is in a manner a desert. At *Hole* there is a college or school for boys, till they come into rhetoric, when they are sent to *Copenhagen* to study philosophy and divinity. Here is also a printing-press, where they did sometime ago print the Old Testament, translated into the *Island* tongue. The New Testament is still in the press for want of paper, which is a dear commodity in that country.

There have been divers bishops of note in *Island*, especially in the see of *Hole*, a catalogue of whom you may see in the *Crimson* of *Angrim Jonas*. *Gundebrand Torlac* was bishop of this see, a person of great probity and learning. *Angrim Jonas* being his coadjutor, had the survivance of this bishoprick granted him by the king of *Denmark*; but after the death of *Gundebrand*, refused to accept of the same, having for some time before devoted most of his time to his private studies. He is still living; and, as *Dr. Wormius* told me, above ninety years of age, notwithstanding which he married a very young woman about four years ago. He is both a man of learning and probity, and much consider'd for his

VOL. II.

knowledge in the affairs of the north, as his writings sufficiently testify.

I had almost forgot to mention one thing, worth our observation among the *Islanders*, viz. that they are great chess-players, there being not a peasant in the country, but what has a set of it, which they make themselves out of fish-bones. The whole difference betwixt theirs and ours, being only that our fools stand for their bishops; because, say they, the clergymen ought to be near the king's person. Their rooks represent little captains, whence the *Island* scholars call them *Centuriones*. They are represented with swords on their sides, with bloated cheeks, as if they were blowing the horn they hold in both their hands. I shall have occasion to speak more concerning the horns used by the northern generals in the wars, which are not unlike that of our *Rouland*, or the horn, or rather trumpet of *Mijenus*, whom *Virgil* styles *Hectoris magni comes*, or, *HeFor*'s companion; it being certain, that in *Germany*, as well as the northern parts, trumpeters are not considered as servants, but officers of the troop; but of this more another time. We return to our chess-game.

This game is not only of antient standing, and generally used, in *Island*, but all over the north. The *Norwegian* chronicle tells us, that *Drofen* the giant, foster-father of *Herald* surnamed the *Hairy*, (as *Chiron* was of *Achilles*) having understood the great actions of his pupil, then king of *Norway*, sent him, among other presents (mention'd in that chronicle) a very fine and rich chess-table. This *Herald* reign'd about the year of Christ 870. And if *Encolpius* in *Petrus* could brag that he had seen *Trimalcion* play at draughts upon tables made of turpentine wood and chrystals, with men of gold and silver; I may boast to have play'd at chess with the countess *Eleonore*, natural daughter to the king of *Denmark*, married to count *Ulefeld*, great marshal, and chief minister to the king of *Denmark*. The tables were inlaid with a white and yellow amber; the pieces of gold, curiously wrought, and enamell'd with the same colours as the tables. The kings and queens were dress'd in their royal robes, seated upon a throne, with a crown on the head. The bishops had their mitres and habits, richly adorned; and the knights were mounted on horses, with fine trappings. The rooks were represented by elephants with towers on their backs. The men were little musqueteers, presenting their guns close to their cheeks, as if they were expecting the word, to fire.

I told you before, that the *Island* tongue was founded upon the antient *Runic* language; and *Dr. Wormius*, who is well ver-

*Chess-play much used in the north.*

*Island a dialect of the Runic.*

fed in the *Runic*, and has writ a whole treatise of it, has assured me, that the *Iceland* tongue is the purest dialect of the *Runic* that is to be found now. For a farther proof whereof it is to be observed, that the alphabet given us by *Blekenius* are *Runic* characters; adding, that some of them being designed for hieroglyphicks, express entire words. *Angrim Jonas* has also a whole chapter of it in his *Crimogea*. And since this book is very scarce to be had here, and consequently much more in *France*, you will I hope not take it amiss, if I entertain you with some things I have observed there, it being certain, that by explaining to you the antiquity of the *Iceland* tongue, I shall at once give you a considerable insight into the ancient state of the north.

*Angrim Jonas* tells us, that the *Iceland* chronicles, speaking of the first inhabitants of the northern part of the world, deduce their origin from a certain *Asiatick* prince, named *Odin* or *Ottin*, who being forced out of the lesser *Pbrygia* by the victorious arms of *Pompey the great*, retired with the remainder of his *Pbrygian* forces into the north. *Angrim* is forced to confess, that the *Iceland* chronicles don't begin but with *Odin*, though at the same time some other northern countries trace their origin much further, viz. of a certain prince, named *Norus*, who first erected *Norway* into a kingdom, and provided them with wholesome laws. This *Norus* was son to *Tberre* king of *Gotland* and *Finland*, the most potent, brave, and most virtuous prince of that age; for which reason he was by his subjects revered like a God; and the *Norwegians* to this day call the month of *January* *Tberre*, after his name. King *Tberre* had a most beautiful daughter, named *Goa*, who being ravished by a foreign prince, her brother *Norus* went in pursuit of the ravisher; and the name of *Goa* was given to the month of *February*, to her memory, the same being retained to this day among the *Icelanders*. *Angrim* has given us the genealogy of all the ancestors of *Norus*, who were reckon'd among the number of the gods by the northern nations; one whereof represented the god of the sea, another of the winds, another of snow, another of the winter. Among the rest they worshipped one under the name of the god of fire, whose statue was extremely fine and handsome; whence they gave him the name of *Halogie*, i.e. a fierce and glorious flame. This genealogy reaches to *Giloe*, a nephew of *Norus*, in whose reign (as the chronicle tells us) the great *Odin* came out of *Asia* into the north.

*Angrim Jonas* finding such a diversity in the chronicles, saw himself obliged to look

farther backwards, beyond the first kings of *Norway*, for the first original of the northern nations, which he deduces from the ancient giants that were forced out of the land of promise by *Jeshua*, and afterwards settled their habitations in the northern parts, from whom the *Gotbs* derive their race, the word *Got* signifying as much as a giant; wherefore I think it not amiss to say something as well in reference to these giants as of *Odin* the *Asiatick* prince.

This famous *Odin* was worshipped as a God all over the north, under the name of *Mercury*, by reason of his excellent wit. It is he who laid the first foundation of the northern poetry, and of their *magi*, so much celebrated in other parts of the world. Of the first I have said something already, and upon the *magi* I could say much more, were it not that it both deserves and requires a most particular account, which I intend to reserve for another opportunity. I can't however forbear to put you in mind upon this occasion, of the negligent temper of many of our modern authors, who, without making any serious reflection upon the circumstances of things imposed upon the world (without the least sense or reason) by antiquity, are not only taken by them for granted, but also improved by them, in order to make them pass current in the world. I would desire any body to consider how little coherence there is betwixt the fabulous relations of *Odin* their *Asiatick* prince, and the time of *Pompey*, so much celebrated in history?

Is it not a most surprizing thing, to see most of the antients, represent the founders of nations, or other great men, like giants? Thus they make *Hercules* three times bigger than other men. And *Virgil* represents his *Aeneas* and *Turnus* like mountains, *quantus Atlas, aut quantus Erix*; and compares *Andarus* and *Bitias* to two tall oaks. Thus all the pictures and statues of *Charles the great* (in the German churches) are much beyond the size of an ordinary man. I remember that I saw the statue of a *Rowland* in the market-place of *Bremen*, of the height of a pike. *Saxo Grammaticus* makes his *Danes* to be descended from giants. *Job*, and *Olaus Magnus*, two brothers, and both *Swedish* historians, do the same with their countrymen, as *Angrim Jonas* describes his first *Icelanders* as giants, the word *Got*, as he says, signifying a giant, and that the ancient *Gotbs* were actually such. And because the giants of *Canaan*, who were drove thence by *Jeshua*, were the first giants mentioned in the holy scripture after the deluge, these must be brought into the north, because *Palestine* was too hot for them to abide in.

The

The two before-mentioned *Swedish* historians (who being brothers, succeeded one another in the archbishoprick of *Upsal*) outdo even *Angrim Jonas* himself in deducing the origin of the *Swedes* from the children of *Japhet*; and take a great deal of pains to persuade the world, that the city of *Upsal* was built in the time of *Abraham*. I wonder how *Angrim Jonas* happened not to follow their footsteps, in deducing the origin of his *Islanders* from the race of *Japhet*; seeing it is said of the children of *Japhet*, in the tenth chapter of *Genesis*, *Ab his divisæ sunt insule gentium in regionibus suis, unusquisque secundum linguam suam, Et familias suas in nationibus suis*; By these were the isles of the *Gentiles* divided in their lands, every one after his tongue, after their families in their nations. For it being a general and orthodox opinion, that the children of *Noah* did repeople the world after the deluge, and that those of *Japhet* in particular, settled in the isles: *Angrim* might with much better pretence affirm, that of the first inhabitants of his isle, than *Olaus Magnus* had told us of the *Swedes* being descended from the race of *Japhet*; for besides that *Angrim* has the history of *Genesis* on his side (which the *Swedes* have not) it saves the trouble of tracing the original of the *Islanders* from the giants of *Canaan* coming into the northern parts.

To tell you my real opinion concerning those gentlemen, who have taken so much pains in making so nice a scrutiny into the first inhabitants of the world, after the deluge, they have taken a great deal of pains in vain; it being certain, that since we are destitute of true histories concerning these most ancient times, all their relations are founded only upon conjectures, or some fabulous chronicle or account ill digested and worse explained. I don't apply this only to *Mr. Angrim Jonas*, for whom I have a singular respect: The error is general, he having not been the first who traced the original of the northern nations from the giants of *Canaan*; besides that, he has no insignificant plea for his assertion, because he found some *Island* words to have no small congruity with the *Hebrew*, which was called the language of *Canaan*, after the *Jews* had made themselves masters of the land of *promise*, by chasing the giants thence. Our author had unhappily forgot, that these giants did not speak *Hebrew*, which being foreign to them, they could not possibly introduce it in the north, if we would take it for granted, that they actually inhabited there.

Many errors of this nature are to be met with in the writings of most of the best authors, who have run upon the same mistake

in looking for the true origin of nations among the interpretation or etymology of certain *German* or *Hebrew* words, which to them seem'd to have a near relation to the language of those nations they were treating of. Thus *Mr. Grotius*, in his treatise of the origin of the *Americans*, deduces their race from the *Germans*, because, says he, many of their words terminate in *Lan*, *Land* being a *German* word. *Mr. Saß* says, that there is a certain nation in *America*, called *Alavardes*, who have got their name from one *Alvarado*, a *Spanish* commander, who conquered them. But *Grotius* traces the origin of the *Alavardes* from the *Lombards*, by a corruption of the word; as to this day the *French* call *Hallbards*, certain arms of the *Lombards*, called *Lombards* by the ancient *French*.

*Mr. Bechard*, a person not inferior in learning to *Grotius*, takes the same road in his treatise called *Ptoleæ*, of the partition and inhabitants of the earth after the deluge, his reasons being founded upon conjectures of the same nature; tho' I must confess I could not but be surpris'd at his stupendous knowledge in the eastern languages, in finding out the interpretation of the *Carthaginian* verse in *Plantus* his comedy, called the *Carthaginian*, out of the *Hebrew*. I told you just now, that his invention is full of ingenuity; but can't however agree with him, that the *Carthaginian* tongue had any relation to the *Hebrew*, for *Dido*, (who founded *Carthage*) being a native of *Phœnicia*, (which language was very different from the *Hebrew*) the *Carthaginians* questionless were so far from speaking *Hebrew* in the days of *Plantus*, that it is most likely they retained the same language that *Dido* had introduced there, viz. the *Phœnician*. *Mr. Samuel Petit*, a learned man and great critick, having before *Mr. Bechard* found out quite another interpretation of the same words in *Plantus*, I am apt to imagine, that if a third person (as well skill'd as they in the *Hebrew*) should undertake the same task, he would find out another interpretation of the same *Carthaginian* verses in *Plantus*, by virtue of the transposition of the letters and points, which these two gentlemen have made use of to attain their end, according to the liberty allowed to the criticks in the *Hebrew*; by which rule they are able to give almost what sense they please to a sentence, just as we can make our chimes found a tune at pleasure.

I hope, Sir, you will pardon this digression, which I thought not altogether foreign to our present purpose, when I observed *Mr. Angrim Jonas* to be misguided by the same error, as many others have been

been besides him, in looking for the origin of the *Islanders* among the *Hebrew*, it being certain, that nothing can be more fallacious than conjectures founded upon such like etymologies.

I am apt to believe, that *Angrim Jonas* would have acknowledged the same giants, who, according to his opinion, first peopled the north, for the first founders of the *Islanders*, were it not that he believes that isle not to have been inhabited till for a considerable time after; wherefore it will not be amiss to relate the chief heads of his relation upon that account. He says, that *Island* was first of all discovered by one *Naddocus*, who, as he was going to the isles of *Faro*, was cast by a tempest on the eastern part of *Island*, unto which he gave the name of *Sneeland*, i. e. *Snowland*, from the vast heaps of snow he saw there, which made *Naddocus* not to stay there long. The next who went in quest after this isle, was a certain *Sewede*, named *Garderus*, who hearing *Naddocus* speak of this isle, found it, and landed there in the year 864; and having pass'd the whole winter there, called it *Gardersholm*, i. e. *Garders isle*. The third person who came into this isle, was a famous *Norwegian* pirate named *Flocco*, who having understood something of the situation of this isle, made use of a peculiar invention for his direction, the compass being then a thing as yet unknown in the world. As he was going from *Hittland*, (one of the *Orcades* or *Orkney* islands) he ventured boldly into the main sea, and having taken three ravens along with him, he let one of them fly as soon as he thought himself at a good distance from the shore; but finding the raven returning towards *Hittland*, from whence he was come, he kept on his course farther at sea; and then letting go the second raven, he soon found by her return to the ship, that she could discover no land; so steering his former course for some time, he sent forth the third raven, which discovering the *Island* shore, *Flocco* followed her with all the sails he could make; and thus with a favourable wind landed in the eastern part of *Island*, then call'd *Gardersholm*, where he pass'd the winter, and finding himself against the spring surrounded with whole mountains of ice, (called the *Greenland* ice by the inhabitants) he gave it the name of *Island*, i. e. *Iceland*, which name it has retained ever since; *Flocco* pass'd another winter in the south part of the isle; but being as little pleased with that part as with the other, he return'd to *Norway*, where they gave him the name of *Kesnafloke*, i. e. *Flocco the Raven*, because he had made use of that creature in the discovery of *Island*.

The true founder of the *Islanders*, was a certain baron of *Norway*, named *Ingulph*, who having with his brother-in-law *Hiorleifus*, killed two of the greatest men of that country in a duel, were banish'd for that fact. And it being the custom of this country for exiles to take along with them the doors or gates of their houses, *Ingulph* having cast anchor near the *Island* shore, threw his gates over-board, in order to facilitate his landing upon them. But being forced to another part of the isle, viz. in the southern part, he landed there; but finding his gates cast ashore three years after, he thought fit to fix his habitation thereabouts. *Ingulph* and his brother-in-law first landed in this isle in the year 870, but did not settle there till four years after, viz. 874, whence the *Island* chronicles take their epocha; this being the time of the first peopling of this isle, which the same chronicle says, *Ingulph* found desert and uncultivated. However, it is said, that some *English* and *Irish* miners were before that time cast ashore here, the same having been discovered by some bells, crosses, and other pieces made in *England* and *Ireland*, and some books they had left behind them. It is agreed on all hands, that the *Irish* had been ashore in this isle several times before the time of *Ingulph*; for their chronicles say, that the ancient *Islanders* called these *Irish*, *Papa's*, and the western part of the isle, *Paper*, from the *Irish* who used to land there.

Because the *Island* chronicle calls *Island*, *A wilderness and uncultivated*, at the time of the arrival of *Ingulph*, *Angrim Jonas* assures us boldly, that it was not inhabited before that time; nay, is angry with those who disagree with him in this point, as *Pontanus*, and others, who would have *Island* be the *Toule* of the ancients mentioned by *Virgil*, who speaking of *Augustus*, says,

— *Tibi serviat ultima Thule.*

For (says he) in his *Specimen Islandicum*, if *Island* is supposed to have been the *Toule* of the ancients, it must have been inhabited in *Augustus's* time; which is contrary to our *Island* chronicles, which tell us, that it was not inhabited till *Augustus's* time.

But I would have this gentleman to call to mind, what he himself has alledged in another place, viz. That the *Irish* used to come ashore in *Island* before the time of *Ingulph*, and that these *Irish* were called *Papa's* by the ancient *Islanders*. I would fain know of him, who were these ancient *Islanders*. I agree with *Angrim*, that *Island* was not converted to the christian religion till some years after *Ingulph* landed there;

*Islanders*, was named *Ingulph*, her-in-law *Hior-greatest* men of the banish'd for the custom of this along with them houses, *Ingulph* the *Island* shore, in order to them. But be- of the isle, viz. landed there; shore three years his habitation his brother-in- in the year 870, four years after, d chronicles take the time of the which the same found desert and it is said, that ers were before the same having ls, crosses, and and *Ireland*, ft behind them. that the *Irisb* le several times for their chro- *Islanders* called the western part the *Irisb* who used

a *Thule*.

n *Icelandicum*, if been the *Thule* e been inhabited is contrary to ch tell us, that *Augustus* his time. entleman to call has alledged in the *Irisb* used to ore the time of *Irisb* were called *Islanders*. I would ere these ancient *Angrim*, that *Ise-* the christian reli- *Ingulph* landed there;

there; but on the other hand, he will, I hope, easily allow me, that there were a considerable number of christians at that time in the northern countries: 'tis certain that the *Irisb* were such, the marks they had left behind them, and found by *Ingulph*, sufficiently testify the same. *Angrim* mentions in his *Crimogea*, that *Ingulph*'s brother-in-law, who came along with him into *Island*, had many sentiments which inclined to christianity, if he was not an absolute christian. And it is certain, that the christian religion was at that time spread all over the northern countries, and among the rest in *Island*, as I shall have occasion to shew anon. This being granted, what time is it that *Angrim* pretends to allow to the pagan *Islanders*, who were, as he says, so zealous in their idolatry, and especially in their adoration of *Odin*, by whom they used to swear, and call him the grand protector of *Asia*. It is beyond all dispute, that among all the heathenish superstitions, the sacrifices of men are of the most ancient date, which, that they were practised among the ancient *Islanders*, I have sufficiently demonstrated before. Their own chronicle tells us, that in the western part of the isle there was a certain cirque, in the center whereof stands a high rock, from whence they tumbled down the miserable wretches design'd for the sacrifice, the blood whereof was afterwards offered to their Gods. The same chronicle mentions, that after the said custom was abolished here, as well as in other places, the rock retained still a red tincture, the remnants of the blood spill'd there before. I must, I say, upon this account, once more ask *Angrim*, where he will fix these many ages mentioned in his annals? And from whence he dates the introduction or invention of their mythology call'd *Edda*, which are of such antiquity, and so peculiar to the *Islanders*, that the other nations have but very little knowledge of it, and all the other *Europeans* none at all.

Add to this, Sir, that the *Island* chronicles, when they speak of the voyages of *Naddheus*, of *Garderus*, and *Flocco* (all which happened before the time of *Ingulph*) don't make the least mention of the isle of *Island* having been a desert at that time: certain it is, that *Flocco* lived there for two whole years, and in all probability, not without such provisions as are the products of a country not destitute of inhabitants. Besides this, how will *Angrim Jonas* come off of what he had said of the *Islanders*, that they were very exact and curious, in recording the histories of all other nations of *Europe*; ad totius Europæ res historicas *Lynceri*, says he: *Herodotus* and *Plato* men-

VOL. II.

tion the fame of the ancient *Egyptians*: For (says he) they preserve in their libraries, the most ancient monuments of the history of foreign nations, looking upon it as the best argument they can alledge for the antiquity of their own nation. To add as much weight as I can unto what *Angrim Jonas* says upon this head concerning his *Islanders*, I must tell you, that Dr. *Wormius* shew'd me a copy of a chronicle of the western part of *Island*, wherein (by his interpretation) I found many remarkable passages in the history of *Norway*, *Denmark*, *England*, the *Orcaides*, *Hebrides*, and among the rest, of the invasion of that part of *France* by the *Normans*, unto which they gave that name after their conquest. The arrival of *Ingulph* being not mentioned till afterwards, it seems very probable, that there were certain people that took care of the records of *Island*, and that consequently that isle was inhabited before that time. I am of opinion, that the *Island* chronicles (which speak of *Ingulph*) cited by *Angrim Jonas*, are authentick, and that the said *Ingulph* did not come into *Island* till about the year 874. But it is possible, that the southern parts, where he landed, were at that time dispeopled either by mortality, or the ravages of certain pirates; yet does it not follow from thence, that the whole isle was destitute of inhabitants. It is not likely, that *Ingulph* could settle a sufficient colony there to people the whole isle; besides, that the *Island* chronicles tell us, that divers neighbouring nations did settle in: divers parts thereof. *Angrim Jonas* himself, makes mention of a certain inhabitant of the *Hebrides*, named *Kalman*; who, he says, was the first who made a settlement in the western part of *Island*, where it is worth our observation, that *Angrim Jonas* does not tell us the time when this *Kalman* came thither, no more than when the *Irisb*, *Scotch*, those of the *Orkney* isles, and others, who inhabited there, fix'd their first habitations in *Island*. 'Tis for this reason, that I imagine, that a considerable difference ought to be made betwixt the isle of *Island*, whilst inhabited by pagans, and betwixt that since christianity was established there: the chronicles of the christian *Island* don't trace their origin beyond the time of *Ingulph*; which, according to the christian *Era* of this country, begins with the year 874. whereas the chronicles of the pagan *Island* have no certain beginning.

Taking this for granted, (as it easily may be) nothing is more easy than to reconcile the chronicles in reference to the pagan and christian *Island*; and consequently to make *Angrim Jonas* to agree with himself; and to allow what *Pontanus* says, viz. that

5 H

the

the modern *Island* is the *Tbule* of the ancients, which he proves from the authority of divers Greek and Latin authors, from the history of *Adam of Bremen*, who writ in the year 1067. of *Saxo Grammaticus*, who lived soon after, and of *Andreas Vel-lejus*, who has translated *Saxo* into the *Danish* tongue, and in his translation always takes the *Tyleasses* for the modern *Islanders*. *Angrim Jonas*, as I remember, alledges, that *Adam of Bremen* has inserted many fabulous relations in his history, and among the rest, that in his time it was received as an ancient tradition, that the ice in *Island* was sometimes found so old and dry, that if thrown into the fire, it would burn as fierce as a certain kind of coal, called *Hoville* by the *Flemings*. But to answer this objection, it is not so much the question here, whether the ancients were not guilty of certain follies; but rather, whether the more ancient the history is, the more it favours of folly; which seems to be an argument for the antiquity of *Island*, and its being known in other parts. Perhaps *Angrim Jonas* will tell us, that if the ancient authors did take the modern *Island* for the same they called *Tbule*, they are much out in its true situation; but to this I answer, that the same authors have committed many errors of this nature in reference to other places; the question being not at this time, whether the said authors have given us an exact description of *Island*, either as it was then, or as it is now; but, whether the isle they described to us was the same with our *Island*.

What confirms me in this opinion is, that *Cajaubon* declares for it; for in his commentaries upon *Strabo*, he tells us expressly, that the *Tbule* mentioned in this great geographer, is our modern *Island*: and, to confess the truth, the thing argues in its own behalf; the modern *Island* being now as well as in former ages, placed by the joint consent of all the geographers, at the extremity of the *Deucalidian* sea, or that of *Scotland*, or the *British* sea; and the ancient *Tbule* has always been accounted the furthestmost of the *Britannick* isles. 'Tis a thing beyond all dispute, that the *Scots* sea has been formerly called the *Caledonian* sea, from that vast *Caledonian* forest, whereof there is not so much as a single tree to be seen at this time in *Scotland*. *Selden* says, that the *Scots* inhabiting the northern parts of that kingdom, were called *Deucalidomans*, which in their language signifies as much as *Black and Swarthy*, as the ocean which washes the northern shore of *Scotland*, and the adjacent isles has been called the *Deucalidian* sea, from the dark and cloudy air which is generally observed thereabouts.

*Pliny* calls it for the same reason, *mare pigrum*, or the *Lazy Sea*; and *Adam of Bremen*, *Mare Jecrum* and *Pulmonum*, because it has a heavy motion like those troubled with an asthma, in the same sense as *Plantus* speaks of asthmatick legs; *pedibus pulmonis mihi advenisti*.

*Angrim Jonas*, as it seems, would not be so averse, to allow that *Island* is the same with the ancient *Tbule*, provided he could be convinced, that that isle was inhabited before the time of *Ingulph*; wherefore, though I have said enough upon this head for the satisfaction of unbiass'd persons; yet will I not think it beyond the purpose, to alledge some undeniable reasons for the proof thereof, viz. that *Island* was inhabited before that time. I have by me two chronicles of *Greenland* written in *Danish*, one in verse, the other in prose. That written in verse, begins with the year 770. when it says, *Greenland* was first discovered. The other assures us, that the person that went first from *Norway* into *Greenland*, pass'd through *Island*, and tells us expressly, that *Island* was inhabited at that time; whence it is evident, that *Island* was not first of all inhabited in the year 874.

*Angrim Jonas* will perhaps object, that my *Danish* chronicles don't agree with that of *Island*, which says, that *Greenland* was not discovered till the year 982, nor inhabited till 986. But I must tell him, that my *Danish* chronicles are founded upon the authority of *Angarius* a great prelate, a native of *France*, who has been acknowledged the first apostle of the northern world. He was made archbishop of *Hamburg* by *Lewis the Mild*, his jurisdiction extending from the river *Elbe*, all over the north, as far as the frozen sea; the emperor's patents, constituting the said *Angarius* the first archbishop of *Hamburg*, are dated in the year 834, and were confirmed by pope *Gregory IV's* bull in 835. The true copy, both of the patent and of the bull, may be seen in the 4<sup>th</sup> book of *Pontanus* his *Danish* history of the year 834. where it is expressly said in the patent, that the gates of the Gospel are set open, and that Jesus Christ had been revealed both in *Island* and *Greenland*; for which the emperor gives his most humble thanks to God.

Two inferences are to be made from thence: first, that *Island* was inhabited by christians in the year 834; and consequently forty years before the arrival of *Ingulph* there: secondly, that *Greenland* was inhabited by christians in the same year 834, which agrees with my *Danish* chronicle, where

where the first discovery of *Greenland* is fix'd to the year 770. *Angrim Jonas* being put to a nonplus, tells us, that he questions the authority of the bull of *Gregory IV.* alledged by *Pontanus*, which he would fain make us believe is supposititious; but to be plain with him, I think he has taken a notion of maintaining the credit of his native country, by adhering too strictly to the authority of its chronicles; whereas it would have been more for his reputation, not to have insisted so much upon that authority, than to rob this isle of the glory of its antiquity; who is so ignorant as not to know, that the age wherein *Ingulph* lived was very barbarous? The *Goths* having carried the same together with their arms throughout all *Europe*; whoever should go about to persuade me into a belief of all what is inserted in the ancient chronicles of these barbarous ages, might as soon make me believe the romances of *Oger the Dane*, or the four sons of *Aymon*, of the archbishop of *Turpin*, and other such like nonsensical stories relating to the same time.

I could wish, *Sir*, you had the opportunity of reading the writings of *Angrim Jonas*, which I had scarce time to peruse. Perhaps you might discover some reasons for the antiquity of *Iseland*, which I have either not discovered or neglected. His *Specimen Islandicum*, was printed at *Amster-*

*dam* 1643. Perhaps his *Crinogea* is not so easy to be had; that which I saw was printed at *Hamburg* in 1609. As I don't question but you will take abundance of pleasure in reading of them, so I will refer myself to them for a more ample account, of what I have related to you now by way of an epitome; it being all I was able to learn, and thought worthy your knowledge concerning *Isel. I.* If I find this to have met with a favourable reception at your hands, I will send you a farther account of *Greenland*, though at the same time I am ready to acknowledge, that considering your merits and reputation you have acquired, by those excellent treatises you have obliged the world with of late, I ought for the future not to offer any thing but what is more polite than this; the defect thereof you will, I hope, attribute in a great measure to the want of time, and my readiness to obey your commands, which must at this juncture serve as a plea to you to excuse its errors; in hopes of which I beg you to be persuaded that I am,

SIR,

Your most humble, and

most obedient servant,

LA PEYRERE.

Concerning the

## MAP of GREENLAND.

**A**S I dare assure my self, that monsieur Chaplain is the true author of this map; having judg'd the same absolutely necessary for the understanding this historical account; so I thought I could not do amiss, in following the advice of a person so highly and so universally esteem'd

I was compil'd this map answerable to four elevations, particularly known to me, viz. that of cape Farewell, of Ifland, of Spitzbergen, and of that part of the Chrillian's-Sea, where captain Monk being stop'd by the ice, gave it the name of Monk's Winter haven.

I have computed the longitude of all these places, from the meridian of the Iron island of the Canaries, by the advice of M. Rorerval, a famous mathematician; and of Mr. Sanlon, an excellent geographer, whose steps I have follow'd in that map.

A great  
lunar e-  
clipse.

Monsieur  
Gallendus.

The old  
new and  
Green-  
land.

The longitude of Monk's Winter-Haven, was more exactly discover'd to me beyond the rest, by an eclipse of the moon, mention'd in the journal of that captain, who declares to have seen it in that harbour, about eight a clock at night, the 20th of December in the year 1619. This eclipse must have been seen at Paris, (according to the tables of the celestial motions) about three in the morning, the 21st day of that month. But in regard, that eclipse continued above three hours, and that captain Monk did not see it, either in its beginning, middle or end, I have consult'd Mr. Gallendus, concerning this doubt; whose abilities and learning being sufficiently known to all, who make profession of these sciences, I thought I might with probability enough, suppose this eclipse discover'd at Monk's Haven, between its beginning and end; that is to say, about the middle of its duration, or about the hour that it must have been seen at Paris; whence it is evident, that when it was there a clock in the morning at Paris, it was no more than eight a clock of the preceding evening at Monk's Harbour; and that consequently there are seven hours difference between the one place and the other. Now supposing 15 degrees for every hour, (according to the rules of astronomy) the meridian of Monk's Harbour must be distant from the meridian of Paris 105 degrees, and Paris being at the 23 degree and a half of longitude, Monk's Haven ought to be plac'd in the 178 degree and a half; that is to say, in the 81 degree and half beyond the meridian of the Canaries: And consequently allowing twelve ordinary leagues of France for every degree of this parallel, the degrees (whereof are one less than the degree of the great circle moiety) this haven must be distant from Paris about 1260 leagues. I have divid'd the southern part of Greenland, taken at cape Farewell, into two islands, in the manner they are represented here. This I have done, not from the Danish accounts I made use of to compose this history (for they don't mention it) but from a map communicated to me out of the library of my lord cardinal Mazarin, by monsieur Naude, (the ornament of that excellent collection of books, and other rarities that make up that renowned library.) These are the words in Latin, written at the bottom of the said map: This delineation was made by Martin, the son of Arnold, born at the Briel, a city of Holland; who twice, viz. 1624, and 1625, went as commodore to the Isle, known by the name of Old-Greenland. This Martin, the son of Arnold, call'd Greenland an island; tho' it is not certainly known, whether it be an island or part of the continent, or made up of several isles. He declares it to be the map of Old-Greenland; tho' he might rather have call'd it both the old and new, for none else has been discovered; and that, which we know, ought rather to be call'd the new Greenland, than the old. Because, tho' the old Greenland must undoubtedly be fix'd somewhere near the coast of Iceland; nevertheless, this certain place is not known to this day, even not to the inhabitants of Norway, tho' their fore-fathers were the first discoverers of it, and dwell in it some entire ages, as will more fully appear out of the following relation.

The nearness of their situation betwixt cape Farewell, and the streights call'd Chrillian's Streights, with the sea of that name, and Monk's Winter-Haven, has been represented according to the map captain Monk caus'd to be made of his voyage, and was annex'd to his journal. I was the rather inclin'd to follow his footsteps, for as much as it agrees with that of captain Hudson, who first discover'd these streights and this sea; which map Mr. Chaplain was pleas'd to communicate to me, in order to compare it with that of captain Monk.

I dare not affirm, that all the coast of the Chrillian's-Sea, and so westerly from thence, between the Gulph of Davis, and Monk's Winter haven, belong to Greenland, because perhaps some great river or streight unknown, may separate Greenland from America. What makes me more doubtful upon this, is, that I never heard in Denmark, that all this coast did belong to Greenland, as I have heard it declar'd of all the coast on the N. E. between cape Farewell and Spitzbergen. I refer the solution of this question to those who have got a better insight into this matter, from the English and Dutch relations; my only design being to give an account of what I understand of this country out of the Danish books, and from the conversation I have had in Denmark.

The Ambassador, mentioned in this relation, was Monsieur de la THULLERIE, who was so instrumental in concluding that famous peace between the two northern crowns.

T O  
Monsieur de la MOTHE le VATER.

S I R,

I Perceive that I have not satisfied your curiosity, in writing to you a long letter concerning *Island*: 'Tis but just therefore, that I should perform my promise, to send you a relation of *Greenland*. Don't wonder at the time that I have taken to pass between these two islands. If you weigh the difficulties and the dangers that attend such a voyage, you will be satisfied that I ought to inform my self with leisure of the true condition of this northern country, which deserves rather the name of *Incognita, unknown*, than the southern part of the world. Nevertheless, it has been inhabited by the *Norwegians*, during the space of five or six hundred years, who traffick'd and settled their colonies there. But that I may not confound matters, I will tell you what I have understood of this country, (which is almost inaccessible,) with all imaginable exactness, from whatever I could learn either by conversation, or from the most confused writings, I will not say that ever I read, because they were explained to me out of a tongue I understood not, as were the *Danish* books, and which Mr. *Rets*, a *Danish* gentleman, was so kind to read and to interpret to me, whom you will see speedily at *Paris*; the king of *Denmark* having named him, in consideration of his merits, his resident in *France*.

Of *Greenland*.

*Greenland* is that northern tract of land which extends from the south to the east, and thence to the north from cape *Farewell*, to the *Deucaliedonian* ocean, all along the coasts of the frozen sea towards *Spitzbergen* and *Neva Zembla*. Some are of opinion, that it joins to the *Great-Tartary*; but this is uncertain, as you shall see anon.

On the east it hath the *Frozen-Sea*, on

the south the *Deucaliedonian* ocean, on the west the streights of *Hudson* or *Christian*, and the *Christian* or *Hudson's-Sea*, that divides it from *America*. Its extent towards the north is unknown hitherto. The *Danish* chronicle informs us, that it is the farthest part of the world towards the north, and that beyond it, there is no land on that side. Some believe, that *Greenland* is join'd to *America*, because the *English*, who have attempted to pass the *Streights of Davis*, to seek a passage that way to the east, have found, by experience, that what *Davis* fancied to be the streights, is nothing but a gulf; tho' according to the account of a certain *Danish* captain, named *John Monk*, who ventured to find a passage to the east, by the north-west of the *Gulf of Davis*, there is great likelihood, that this country is altogether separated from *America*, as will appear in its proper place, when we shall discourse of this voyage. The elevation of *Greenland* taken at cape *Farewell*, (the most southern part of it) according to the computation of captain *Monk*, a most expert seaman, is sixty degrees and thirty minutes: The other part extending much nearer to the pole. The elevation of *Spitzbergen*, which the *Danes* judge to belong to *Greenland*, is according to their computation 78 degrees or thereabouts. I don't say any thing concerning the longitude of that country, because my accounts being silent here, I have learn'd nothing more than what our maps inform upon this head. It will be sufficient for me to take notice in this place, that cape *Farewell* is beyond the *Canaries*, and our first meridian: As to the history of *Greenland*, I have chiefly made use of two chronicles,

Its latitude.

one of *Iceland*, the other of *Denmark*; the first being very ancient and in prose, the other of a later date in verse, but both in the *Latin* language. However the original of that of *Iceland* was written in the *Iceland* tongue, by one *Snorro Sturluson* an *Iceland*er, who was *Nomophylax*, as *Angrim Jonas* call him; that is, chief justice of that island, in the year 1215, the same who compiled the *Edda*, or the *Iceland* fables in verse I have formerly mentioned to you. The *Danish* chronicle was written in *Danish* verse, by a *Danish* priest, named *Claudie Christoffersen*; within these 15 years, or thereabouts. This *Danish* chronicle says, that some *Armenians* being long toils'd at sea by a furious tempest were forced into the northern sea, at last got ashore in *Greenland*, from whence they pass'd over into *Norway*, where they inhabited the rocks of the *Hyperborean-Sea*: But this relation is founded only upon ancient fables and customs, to deduce the original of remote places and nations: But thus much is certain, that the *Norwegians* did first discover and inhabit *Greenland*.

Torwald  
and his son  
Erick.

A certain gentleman of *Norway*, named *Torwald*, and his son *Erick*, surnamed the *Red-hair'd*, having committed a murder in his country, fled over into *Iceland*, where *Torwald* died. His son *Erick* being a choleric person, kill'd soon after another man in *Iceland*; so that to escape the severity of the law, he resolv'd to seek for shelter in a country which one *Gundebur* had told him he had seen to the west of *Iceland*; *Erick* landed by his direction, in a certain harbour, made by two capes or points of land, viz. one at the end of an island, opposite to the continent of *Greenland*, the other on the continent. The cape of the island was named *Huidferken*, that of the continent *Huarfs*; having between both a very good harbour call'd *Santassin*, where ships may ride safely at anchor, even in the greatest storm.

*Huidferken* is a prodigious high mountain, without comparison much bigger than *Huarf*. *Erick* call'd it *Mukla-jokel*, i. e. the *Ice-mountain*; but it has been since named *Bloferken*, i. e. the *Blue-Shirt*; and a third time *Huidferken*, i. e. the *White-Shirt*. The reason of these two last alterations, seems to be founded upon the change of its colour; for the ice that melts and freezes at the same time, appears in colour at first not unlike the moss or grass or little trees growing upon these rocks. But when by a long continued snow, vast heaps are gathered, the ice becomes extraordinary thick and returns to its former colour and natural whiteness. This I can affirm by my own experience in *Swedeland*, where we have seen rocks, some whereof appeared

to us of a bluish, and others of a white colour for the same reason. I will assure you, and my lord ambassador can testify, that in our return the same winter from *Swedeland* to *Denmark*, as we pass'd in a coach over the sea, betwixt *Elfsure* and *Copenhagen*, we met vast shoals of ice piled upon one another; some whereof appeared to our sight very white; others of the finest azure, which being not able to give a sufficient reason for this difference, as being produced by the same water; and minute in respect of our eyes, at no such distance as to cause so remarkable a difference: This put me in mind of what *Virgil* says concerning the frozen *Zones*.

*Cerulea glacie concretæ atque imbribus atris.*

Tho' I am apt to believe that the words *Cerulea glacie* ought to be interpreted in this passage, the *Black Ice*, as *Virgil* fancies to be in these dark and black countries; in the same sense he says in another place,

*Olli ceruleus supra caput adstitit imber.*

And in another place,

*Stant manibus ære,  
Ceruleis mastæ vitis atræq; cupressæ.*

In both which passages the word *Ceruleus* signifies black, without all dispute.

But to return to our purpose, *Erick* before he would venture on the continent, thought it advisable to land in the isle unto which he gave the name of *Erickland*, i. e. *Erick's Isle*, and continued there all the winter. In the spring he pass'd over to the continent, which he call'd *Greenland*, i. e. the *Green-Country* from the verdure of its pastures and trees. Unto the place where he landed, he gave the name of *Ericksfjorden*, i. e. *Erick's-Haven*, at a small distance from whence he built certain habitations, call'd *Ostraburg*, i. e. the *East-borough* or plantation. Next *Autumn* he went to the western-side, where he erected another plantation call'd *Vestreborg*, i. e. the *Western-Borough*. But whether the continent seem'd to him colder and sharper than that of *Iceland*; or whether he found it less secure, he returned the next winter to *Erickland*; yet returned from thence next summer to the continent, taking his course towards the north, to the foot of a great rock which he named *Sneefjel*, i. e. the *Snow-Rock*, and thence to a certain harbour, upon which he bestowed the name of *Ravensfjorden*, i. e. *Rookefjorden*, from a great number of crows or ravens he found there. *Ravensfjorden* lies directly opposite to the north-line of the *Ericksfjorden*, which is seated on the south side

side, being divided only by a branch or arm of the sea. About the end of autumn, *Erick* returned to his island, where he pass'd the third winter. In the spring he resolv'd to go in person to *Island* to engage the inhabitants of that isle (with whom he had good correspondence) to follow him into *Greenland*; he was not backward in telling them wonders of this new discovered country, of its plenty of great and small cattle, of excellent pastures, of fishes and all sorts of game. His rhetoric proved so prevailing, that a good number of them crossed the sea with him into *Greenland*.

*Erick* had a son named *Leiffe*, accompanied his father into *Island*, and from thence crossed over to *Norway*; where, as my chronicle of *Island* tells us, he gave a favourable account to king *Olaus Trugger* of the country discover'd by his father. The king of *Norway* having then but lately embraced the christian religion, caus'd *Leiffe* to be instructed in the same, and to be baptiz'd, who continued at his court all the winter. The next summer he sent him back to his father into *Greenland*, in company of a certain priest, to instruct *Erick* and his people in the christian faith. *Leiffe* being returned to his father in *Greenland*, had the name of *Leiffdenbepne*, i. e. *Leiffe the fortunate* bestow'd upon him, because he had escap'd great dangers in his voyage: On the other hand, he met with but an indifferent reception from his father, because he had brought along with him certain strange seamen, who being shipwrecked during the same tempest he so narrowly escap'd, he found upon the keel of their ship, cast upon the ice-rocks, and receiv'd them into his ship, and carried them into *Greenland*. *Erick* was displeas'd because *Leiffe* had, as he alledged, shew'd to the strangers the way to a country he desired not to discover to all the world: But the generous *Leiffe* knew so well how to manage his father's savage temper, by representing to him the true duty of humanity, and of charity the chief ornament of christians, that he began to relish his and the priest's advice, sent to him by the king of *Norway*, with such success, that he was persuas'd to suffer himself to be baptized, as did all the inhabitants under his jurisdiction. This is all I could learn concerning *Erick*, his son *Leiffe*, and those first *Norwegians* that inhabited *Greenland*. The *Island* chronicle mentions the departure of *Torwald* and of *Erick* his son from the harbour of *Jedrem* in *Norway* to have happened under the reign of *Hakon Jarle*, surnamed the *Wealthy*, where this chronicle begins under the reign of *Olaus Trugger* king of *Norway*.

Vol. II.

who reign'd about the year of our lord 982. But the *Danish* chronicle put it about the year 770. I have proved to you in my relation of *Island*, that this computation is more probable than the first, by a bull of pope *Gregory IV.* granted about the year of our Lord 835, to bishop *Ansgarius*, to encourage the propagation of the christian religion in the northern countries, and particularly in *Island* and *Greenland*. I will not pretend in this place to weigh all the arguments alledged on this head, but will content my self to mention two particulars only, in relation to this opinion. The first is, that the same *Danish* chronicle says, that the kings of *Denmark* being continued christians, during the reign of the emperor *Lewis the Mild*, *Greenland* was much talk'd of in those days. The second is, that Mr. *Gunter*, secretary to the king of *Denmark*, a person of more than ordinary learning and ingenuity, and my intimate friend, has assured me, that he himself saw among the records of the archbishoprick of *Bremen*, an ancient MS. chronicle containing a copy of a bull, by virtue whereof the archbishop of *Bremen* was constituted metropolitan of all the north, and particularly of *Norway*, and of the islands thereunto belonging, viz. those of *Island* and *Greenland*. He had indeed forgot the date of the bull, but remembred very well that it was granted before the year of our lord 900.

The *Danish* chronicle says, that as the successors of *Erick* increased in number in *Greenland*, they ventured deeper into the countrey, and met with a fruitful soil, meadows and rivers in the valleys between the mountains. They divid'd *Greenland* into east and west *Greenland*, according to the different situation of the two boroughs. *Ostreborg* and *Vestreborg* built by *Erick*. In the east they laid the foundation of a town named *Garde*, whither (as the chronicle tells us) the *Norwegians* transported every year, divers merchandizes, and sold them to the inhabitants.

Their posterity went farther in, and built a city, unto which they gave the name of *Albe*. And as their zeal increased, they built a monastery upon the sea-shore, dedicated to *St. Thomas*. The city of *Garde* was the residence of their bishops, and the church of *St. Nicholas* (the patron of seamen) built in the same town, the cathedral church of *Greenland*. A catalogue, together, with the succession of those bishops, is to be seen in that part of the *Specimen Islandicum* of *Angrim Jonas* which treats of *Greenland* from the time of their settlement there, 'till the year 1389. And *Pontan* observes in his history of *Denmark*, that

5 K in

Garde a town in Greenland.

St. Nicholas Church.

## An Account of GREENLAND.

in the same year 1389, one named *Henry* bishop of *Garde* was present at the assembly of the states of *Denmark* held at *Nieu-burg* in the isle of *Funen*, at the entrance of that part of the *Baltick* sea, commonly call'd the *great Balt*. As *Greenland* was under the jurisdiction of the kings of *Norway* in temporal matters, so their bishops acknowledged the superiority of the bishops of *Drunben* in *Norway*, in ecclesiastical matters; and the bishops of *Greenland* used frequently to cross the sea into *Norway* to advise with the bishops of *Drunben* about such difficulties as sometimes intervened in points of religion. *Greenland* was then governed by the laws of *Iseland*, under certain governors, appointed by the kings of *Norway*. The names of whom, with the actions performed by some *Iseland* heroes in *Greenland*, you may read in the *Specimen Islandicum*, where good *Angrim* their affectionate countryman has remembered them to the best advantage.

Green-  
land.

The *Danish* chronicle tells us, that in the year 1256, *Greenland* revolted and refused to pay their tribute to king *Magnus* of *Norway*; which induced king *Erick* of *Denmark* (at the request of king *Magnus* who had married his niece) to equip a fleet against them; but they no sooner saw the *Danish* flags display'd on the coast of *Greenland*, but they were seized with alarm, that they sued for pardon, and desired peace. The king of *Denmark* (in respect of the love he bore to his niece, and her children) would not take any advantage of the weakness of the king of *Norway*, but left him in full possession of *Greenland*. This peace was concluded in the year 1261. *Angrim* *Jonas* further mentions the names of the three principal inhabitants of *Greenland*, who were instrumental in concluding the treaty of peace in *Norway*. By virtue thereof those of *Greenland* were for the time to come to swear fealty, and to pay tribute to the kings of *Norway*.

The chronicle of *Iseland* being only a collection of other stories; has among the rest a chapter entitled a description of *Greenland*, which as it seems to relate to its most flourishing state during the settlement of the *Norwegians* there; so I will transcribe to you *verbatim* the whole chapter, as it was interpreted to me from the *Danish* tongue into *French*. But don't require from me either time or method in this relation, for I can warrant neither.

Skagfi-  
ord.

In the most eastern part of *Greenland* lies the city of *Skagfjord*, seated near an inaccessible rock; and further at sea, a sand-bank hinders ships from entering the road, except at high water, when if the wind blows hard, many whales and other fish

come into the bay, and are taken in great abundance. A little higher towards the east, there is another harbour called *Funchebuder*, having borrow'd its name from a certain page of *St. Olav* king of *Norway*, who was with several others shipwrecked there. A little higher nearer the

*Ice-mountains*, there is an island called *Roon-fon*, well stor'd with all sorts of wild beasts, and particularly with white bears, but beyond it nothing is to be seen but ice, both on the sea and land side. On the western coast lies the bay of *Kindelford*, inhabited all along the shore. On the right hand of this bay stands a church called *Korsirk*, i.e. the *Cross-Church*; the land whereof reaches to *Petresvik* near *Vandaleburg*; and beyond it monastery of monks, dedicated to *St. Olav* and *St. Austin*. The jurisdiction of a monastery extends to *Bolton*. Next to *Kindelford* is *Rumpeinford*, where is a nunnery, and near it several little islands, having

divers hot springs of such an excessive heat in the winter, that no body can endure it, tho' in the summer they are pretty cool and temperate; these waters are very wholesome, and proper for the cure of divers diseases. A little beyond them is *Eynetsford*: Between *Eynetsford* and *Rumpeinford*, stands a royal palace call'd *Fos*; and a great church dedicated to *St. Nicholas*. Near the bay of *Lunesford* is the cape of *Klining*, and beyond it another bay called *Grantevig*, and beyond that a house named *Daller*, that belongs to the cathedral of *Greenland*. To this cathedral appertains all the country about *Lunesford*, and particularly the great island beyond *Eynetsford* called *Reyalsen*, because of the many *Renes* (a kind of stags frequent in the north) found there. This island produces a certain stone called *Talguestein*, of such solidity as not to be corrupted by fire, and so easy to be cut, that drinking vessels, kettles, and vats containing ten or twelve ton, are made of it. More towards the west is an island called *Langen*, where are eight farms. This island belongs to the cathedral. Near to the church of *Eynetsford* is a royal palace named *Hallestad*. Not far from it is the bay of *Ericksfjord*; at the entrance whereof lies an island called *Herrieven*, i.e. the *Lord's-island*, one half whereof belongs to the cathedral, the other half to the church called *Diurnes*, the first church you meet with in *Greenland*, as you enter on *Ericksforden*. To the church of *Diurnes* belongs all the country as far as *Midford*, and the whole track of land from *Ericksfjord* to the north east. Near it is *Bondeford* to the north, where are many islands and good harbours. The country is not inhabited, but altogether desert between *Ofstreburg* and *Vestreburg*. Near to this desert is a church

named *Strofnæs*, formerly the cathedral, and residence of the bishop of *Greenland*. The *Skreklingues* or *Skreklingres* inhabit all the country about *Vestreborg*. These deserts produce horses, goats, oxen, sheep, and all manner of wild beasts, tho' not inhabited either by christians or pagans. The author of this account was one *Iver Ben*, who was a long time steward of the bishop of *Greenland*, and an eye-witness of what he says, having been with others employed by the judge of *Greenland* to suppress the *Skreklingres*. At their arrival they found no living men, but abundance of cattle, of which they took as much as their ship could carry. Beyond *Vestreborg* is a great rock call'd *Himmetradshild*; beyond this rock there is no safe passage for ships, by reason of the many whirlpools on that coast.

These are the contents of the whole chapter which I have set down here with as much exactness as I was able; and as I had neither map, nor any other history of *Greenland*, to justify or contradict this account, I have given it you in the same manner as I had it. What puzzles me most is, what is said of the church of *Strofnæs*, between *Ostreborg* and *Vestreborg*, to have been ever since *Greenland* began to be inhabited, the cathedral and the bishop's residence; there being not the least doubt but that the city of *Garde* has always had that prerogative. The *Danish* chronicle lamenting the loss of this country, assures us, that if the city of *Garde*, the residence of the bishop, were yet in being, and the passage thither could be recovered, we might from thence be supply'd with sufficient memoirs for the comprizing of a good history of *Greenland*. *Angrim Jonas*, a native of *Island*, speaking of this residence, says expressly, *Fundata in Bordum* (we must read *Garden*) *episcopalis residentia in sinu Eynetsford Greenlandicæ Orientalis*; An episcopal see was settled in the city of *Garden* in the bay of *Eynetsford*, on the eastern coast of *Greenland*. The author of that relation may perhaps have been a good steward, but has proved himself but an indifferent historian, having not given us the least account who were these *Skreklingres*, against whom he was sent. I will therefore tell you what *Mr. Wormius*, the most curious person that ever I met with in the affairs of the north, has communicated to me by word of mouth, and in writing. They were savages, the original natives of *Greenland*, unto whom 'tis probable, the *Norwegians* gave that name, but for what reason I know not. 'Tis likely they inhabited the west side of the bay of *Kindelford* in *Greenland*; the other being inhabited by the *Norwegians*. What this author says concerning the *Skrek-*

*lingres* being in possession of *Vestreborg* must be understood of the west side; the east part being possessed by the *Norwegians*. 'Tis very probable that some few of the *Norwegian* adventurers having passed the other side of the bay of *Kindelford*, were worsted by those *Skreklingres*. The viceroy or governor of *Greenland*, called the judge of *Greenland* (according to the *Island* idiom) being resolved to revenge this affront, sent against them a ship well equip'd, and mann'd with land-forces, which those savages no sooner saw approach their shore, but according to their usual custom (when they find they are too weak to resist) they fled into the woods and rocks. The *Norwegians* finding no living body upon the coast, plunder'd the country, and carried the booty aboard their ship. This did induce our author to tell us, that amongst the *Skreklingres* were horses, goats, oxen, sheep, &c. but neither christians nor pagans.

*Mr. Wormius* is of opinion, that those *Skreklingres* were not far distant from the gulph of *Davis*, and perhaps were *Americans*, or the native inhabitants of *New Greenland*, discover'd by the *Danes* in the reign of *Christiern IV.* their king; of which I shall have occasion to speak more hereafter: That they lived near the *Old Greenland*, inhabited by the *Norwegians*, and that they peopled part of *Vestreborg*, before ever *Erick* possessed himself of the other part.

To tell you my opinion, I see no reason why we should transplant the *Americans* hither; *Mr. Wormius's* opinion is more reasonable; unto which I shall add only, that by the same reason that *Vestreborg* was inhabited by the natives of that country, when the *Norwegians* came thither, *Ostreborg* had likewise its inhabitants. And as the eastern shore was nearer to the *Frozen Sea*, it was less fruitful, and by consequence more desert than the western coast. The *Norwegians* finding less resistance on that side than on the other, took possession of *Ostreborg* with less resistance than *Vestreborg*; and according to all the relations that I have seen, they were not so resolute in attempting a passage on the western coast, but to the north where they travell'd eight days together, without discovering any thing but snow and ice in the valleys. From whence you may infer, that the track of land inhabited by the *Norwegians* in *Greenland* was enclosed between the southern and eastern seas; to the north by inaccessible ice-mountains, and to the west by the *Skreklingres*, who stopp'd their farther progress on the side of *Vestreborg*. It is also observable, that the *Island* chronicle affirms it for a certain truth, that the *Norwegians* were possessed of so small a track

track of land in *Greenland*, as would not amount to above a third part of a bishoprick in *Denmark*, notwithstanding their bishopricks are no larger than those of *France*. The *Danish* chronicle declares the same, tho' in different words, viz. that the *Norwegians* did not inhabit the hundredth part of *Greenland*; that it was inhabited by divers nations, governed by their peculiar lords, most of whom were never known to the *Norwegians*.

Green-  
land bar-  
ren.

The *Iceland* chronicle speaks variously concerning the fruitfulness of *Greenland*, according to the different relations that compose it. It says in one place, that there grows the best wheat in the world, and high and lott oak, which bear acorns as big as apples. In another place he tells us, that nothing grows in *Greenland*, because of the cold, and that its inhabitants know not what bread is. This agrees with the *Danish* chronicle, which affirms, that when *Erick* first came into this country, his people were forced to live altogether upon fish, by reason of the sterility of the land. Nevertheless the same *Danish* chronicle relates, that *Erick's* successors, who went farther into the country, found between certain mountains, fruitful lands, meadows, and rivers, not discover'd by *Erick*. The contradictions in the *Iceland* chronicle are not to be regarded, when it declares that nothing grows in *Greenland*, because of the cold, the reason itself alledged to back this assertion, rendering it very dubious; it being most certain, that that part of *Greenland*, inhabited by the *Norwegians*, was situate under the same degree of elevation with *Upland*, the most fruitful province of *Swedeland*, which produces very good and fine wheat. Add to this what the same chronicle observes in another place, viz. that the cold is not so violent in *Greenland* as in *Norway*. Now 'tis most certain, that *Norway* produces very good wheat; and what I am going to tell you upon this head, would perhaps seem strange to you, if the same was not founded upon the authority of creditable persons, who have informed me that there are certain places in *Norway*, where they have two crops within the space of three months. This must be understood of the plains betwixt the rocks, which being continually enliven'd by the reverberated sunbeams against these rocks, in the months of *June*, *July*, and *August*, become so fertile, that in six weeks time they sow and reap good corn. The soil being so fat and moist there by reason of the great quantity of snow melted and carried into the plains from the mountains, that immediately after they sow again, and at the end of another six weeks, never fail of a second harvest as good as the former.

Norway  
wonderful  
fruitful.

'Tis very likely, that in *Greenland*, as well as other countries, are some good and some bad grounds; some plains, some mountains. 'Tis certain it has many rocks; the *Iceland* chronicle tells us expressly that it produces marble of all colours. And it is agreed on all hands, that their pasture grounds are excellent, and maintain abundance of great and small cattle, many horses, hares, stags, renes and other deer, ordinary wolves, and stag-wolves, foxes, bears white and black; and if credit may be given to the *Icelandian* chronicle, they have taken castors and martins also, the furs whereof were not inferior to the martin fable of *Muscovy*. *Greenland* abounds more in falcons (white and grey) than any other place in the world. Formerly these birds used to be sent to the kings of *Denmark* as rarities, because of their extraordinary goodness; and the kings of *Denmark* presented them frequently to other kings and princes, because falcons and hawks are not used in *Denmark*, nor in any of the northern countries.

Green-  
land dogs.

The sea produces great plenty of fishes all along the coasts of *Greenland*; as likewise sea-wolves, sea-dogs, and sea-calves, and an incredible number of whales. I know not whether I ought to reckon the white bears of *Greenland* amongst the terrestrial or marine creatures; for, as the black bears never forsake the land, and live altogether upon flesh; so white bears never leave the sea, and live upon what fish they catch. They are much larger and wilder than the black. They hunt after the sea-wolves and dogs, who save their young ones upon the ice for fear of the whales. They are greedy after the young whales, their flesh being a greater dainty to them than that of any other fish. They never of their own accord venture into the main sea when the ice is melted. 'Tis not but that they can swim, and live in the water as well as the fish, but they much dread the whales pursuing them by the scent, out of a natural antipathy, and because they devour their young ones. It happens sometimes that vast ice shoals are from the north part of *Greenland* driven towards the south, so that the bears not daring to venture from the ice are carried along with it, either into *Iceland* or *Norway*, and being enraged with hunger,

beasts, called unicorns. In *Denmark* we have frequent opportunity to see many of them entire, and some pieces of these horns. If you enquire what sort of animals bear these horns, I must tell you, Sir, that they are horned creatures, improperly named unicorns, having nothing common with that so much celebrated horn of the creature which bears that name, of what nature soever it be. And as this name is ambiguous, some do yet question whether the creatures that have them are flesh or fish. You may observe, that the horns of the unicorns which I saw in *Denmark*, (whether whole or in pieces) are of the same substance, fashion, and virtue, as those seen in *France* and elsewhere. That beautiful entire horn I have sometimes spoken of to you, in the king of *Denmark's* palace at *Fridericksbourg*, is without dispute bigger than that at *St. Denis*. I confess, 'tis not so straight, and bends within two or three foot of the point; but for the rest, 'tis of the same colour, shape, and weight as that of *St. Denis*; for the pieces of those horns I have seen in divers places at *Copenhagen*, are esteemed great preservatives against poison, as those in *Paris*, and elsewhere are. Now taking it for granted, that all those horns in *Denmark* are altogether the same with those of *France*, and that these of *Denmark* are brought thither from *Greenland*, the main question is, What sort of animals bear these horns in *Greenland*? Mr. *Wormius* being the first who informed me that they are fishes. This occasioned a smart dispute betwixt us at *Christianople*, this opinion being contradictory to the sentiments of all the naturalists, who have disapproved of it; who represent the unicorn as a terrestrial four-legg'd creature, which agrees with divers passages of holy Scripture, which cannot be understood but of four-legg'd unicorns. A curious and learned person having had the goodness to give me a farther account thereof in his letter from *Copenhagen*, I will insert the copy thereof here.

SOME years ago being at Mr. *Frise* the lord chancellor of *Denmark's* house (the predecessor of Mr. *Thomafson*, the present lord chancellor) I took an occasion to complain to that great man, of the negligence and want of curiosity of our merchants and seamen that frequented *Greenland*, in not enquiring into the nature of those animals, the horns whereof they brought in such plenty to us, without giving themselves the trouble of bringing along with them some part of their flesh or skin, for the better discovery of the whole. The

VOL. II.

lord chancellor answer'd, they are more curious than you imagine, and instantly sent for a great piece of a dry'd skull, with part of that kind of horn on it, of about four foot long. Being extremely rejoiced to see me hold in my hands so great a rarity, and could scarce sufficiently feast my eyes with the sight of it, as not understanding at first what it was, I enquired my lord to give me leave to carry it home to my house, to look upon it there at my own leisure, which he readily granted. I found this cranium or skull much like that of the head of a whale, having two holes on the top, and which penetrate to the palate or throat; these two holes, being doubtless the two passages thro' which this fish spouts up the water it drinks: I took also notice, that what they called the horn, proceeded out of the left side of its jaw. I invited the most curious and ingenious of my auditors, to be eye witnesses of so extraordinary a sight in my closet, and among the rest sent for a painter, who in the presence of all the company drew the picture of that skull, with the horn, as it really was in figure, and answerable to its bigness, according to the original.

My curiosity stop't not here; but understanding that such another creature had been taken near, and carried into *Island*; I writ to the bishop of *Hole*, whose name was *Thorlac Schalamius*, and who had been formerly my disciple at *Copenhagen*, to send me the draught of that animal, which he did accordingly; and sent me word at the same time, that the *Islanders* call it *Narbual*, that is, a whale *Narbual*: that feeds upon dead carcases; for *Hual* a great *Fish*. signifies a whale, and *Nara* a dead carcass. 'Twas really the picture of a true fish, like a whale; I promise to shew it to you in your return from *Christianople*, with that of the skull I had from my lord chancellor *Frise*.

Mr. *Wormius* fail'd not at our return to fulfill his promise and even beyond it; for not satisfied to shew me the draughts of those fishes, he led me into his closet, where I saw upon a table the skull it self of that animal, which my lord chancellor had formerly delivered to him. He had got it, (at his request) from a *Danish* gentleman, a kinsman of monsieur *Frise*, who being one of his co-heirs, had got it for his share, and valued it at 8000 rixdollars, and had brought it 20 leagues to *Copenhagen*, to shew it to my lord ambassador. I must confess, that I could not sufficiently

5 L

admirer

admire so exquisite a piece of curiosity. After he had carried it to my lord ambassador, he was desirous to look upon it in the same closet. His excellency viewed it with more than ordinary satisfaction, and intreated Mr. *Wormius* to lend it him, in order to have a draught made of it, which he intended to carry with him to *Paris*. This great man, who has a great veneration for all virtuofes, will be glad to shew this draught among his other curiosities he brings along with him from the north. As he has a particular affection for you, and for all those gentlemen of the famous and ingenious society of the library of monsieur *Bourdelot*: So I am certain that his closet (which he designs to furnish and accomplish, if God grants him life) will after his return into *France*, be free for you, and for all those gentlemen.

Unicorns.

There is no doubt, but that the name of unicorn is equivocal, and belongs to several animals, as to the onyx and *Indian* ass, mentioned by *Aristotle*, and to that wild beast, described by *Pliny* to have the head of a stag, the body of a horse, and the feet solid, all of a piece, like the elephant; and besides this, of a wonderful swiftness and strength, being the same unicorn, mention'd in several places of the holy scripture. As to its swiftness, the same is represented as so marvellous that God will cause *Syrian* (a mountain of *Libanus*;) to skip as the foal of an unicorn, and its strength so exalted that the power of God is compared to it. The strength of God, (saith *Moses*, the leader of the children of *Israel*;) is like that of the unicorn. Whence it appears that our unicorns of the north, which we know to be fish, must be of a different kind from the unicorns believed to be in the south or eastern parts of the world, and are without doubt terrestrial animals, when the prophet *Isaiab* foretells the *Jews* that God would drive them and their kings (whom he names unicorns) from *Jerusalem*. The unicorns, saith he, shall descend with them: This cannot be understood but of a terrestrial creature; if the prophet had supposed those unicorns to be fishes, 'tis likely he would have said, they shall swim, instead of, they shall descend. I will therefore call them a kind of sea-unicorns, as others have done with sea-dogs, sea-calves and sea-wolves. This name is not new, seeing *Bartholine* a *Danish* author hath inserted a peculiar chapter of sea-unicorns, in his treatise of unicorns. Notwithstanding which, there remains still another difficulty, viz. whether these sea-unicorns (of which we are now speaking)

be really unicorns, and whether that we call their horns, be truly horns, or rather their teeth. The resolution of the first doubt depends upon the second, for if they be teeth, those fishes cannot properly be called unicorns, because they have no horns; and if they be horns, they are doubtless unicorns, because they have but one horn. Mr. *Wormius* affirms, that they are teeth and not horns. And I find that *Angrim Jonas* calls them *Dentes* in that place of his *Specimen Islandicum*, where he speaks of a bishop of *Greenland* named, *Arnoldus*, being shipwreck'd as he was sailing to *Norway*; the ship being shatter'd to pieces by a storm in the *Isfimus* to the west of *Island*. This shipwreck happened in the year 1126: He mentions the several things taken up out of this shipwreck; *Reperti sunt*, saith this old man, *Dentes Balenarum*, &c. There were cast ashore by the tide, precious and rare teeth of whales, *Runic* letters done upon them, with a red gum, not to be blotted out, that every one of the seamen at the end of their voyage might know their own. And 'tis certain, that this *Angrim Jonas* understands by these precious teeth of whales, the same which in *Denmark* they call, and ought to be understood of, those horns we attribute to unicorns, and of which we now treat; what makes me suppose them to be teeth and not horns is, that *Aristotle* lays it down as an undoubted truth, that all unicorns carry their horns in the middle of their foreheads; but these fish have that which we name horns, at the end of their snout or under-jaw or gum, in the same place where teeth are fixed: That the horns are growing in the forehead *per symphysem*, i. e. by an adjunction or natural union with the bone, but the teeth are sunk into the gums *per Gampbesim* i. e. as a wedge or nail that enters the substance. This was plainly to be seen in that skull monsieur *Wormius* shew'd us, which was sunk into the jaw near a foot deep, and stretch'd out in length like a lance, laid flat in the same manner as the fish named *Pristis* carries its sythe, and the *Xipbias* or sword-fish wears its sword.

I have taken notice of a very good reason, or rather observation in *Aristotle*, concerning the horn of these unicorns. He says, that all the animals that have two horns, are cloven-footed; but all unicorns have but one solid claw: That nature had made the same union, and the same conjunction of claws in the feet, as of the horns in the head of the unicorns, as it has made the same division of claws and horns in the feet and hands of other animals. From whence it follows, that

the only distinction of the unicorns from the other animals, consists in the unity and solidity of their claws and horns; and by the same reason that the unicorns have their claws in their feet, as the other animals, they bear their horns in the same place of the head, namely in the forehead: And as the other beasts that have two horns, carry them on both sides of their front, they that have but one, have it in the middle of the fore-head. But as the fish we are speaking of, that have neither claws nor feet, cannot have any horns in their head, we may from hence conclude, that what some suppose their horns, being fixed deep into their jaws, and not fastned to their front, cannot properly be said to be horns, and therefore are to be reckon'd as teeth.

At first I my self was not of this opinion, but as I was disputing about it with monsieur *Wormius*, the great marshal of *Denmark*, (of whose high birth, eminent virtues and dignities he possesses next to the king, my letters have informed you before.) This great person, who has honoured me with his particular favour, and taken a singular satisfaction to satisfy my curiosity in every thing I could desire, told me in relation to this matter something that confirm'd me in my first opinion, that they were horns and not teeth. He acquainted me, that the king of *Denmark*, his master, designing to make a present of a piece of this sort of horns, that should be extraordinary beautiful and handsome, he order'd him to cause an entire horn to be sawed near the root, where 'tis biggest and most beautiful. As soon as he had sawed a little of the horn, (which he fastned to be solid) he found it hollow within, and what surpris'd him most, in the same concavity, another less horn, of the same figure and substance as the great one. He order'd the great horn to be sawed round, without touching the little one, and found it to be grown in the inside of the great one, about a foot long within the concavity, the remainder of the great one being solid. This made me imagine that the animals which bear those horns, cast them as the stags do theirs, that their great horns fall off, and others come in their stead; and that it was doubtless for this reason, that so many horns separated from their heads, were carried by the ice-shoals unto the coast of *Greenland over Iceland*: But I was soon convinced to the contrary, when I saw the skull before mentioned, and observed that long root that was fixed in its jaw-bone, and that the very same thing that the said minister told me he had

caused to be sawed, was a tooth and no horn. That also 'tis possible that the teeth fall, and others grow in their stead, in these fishes, as well as they fall and grow again in children, and some persons of a more advanced age. 'Tis very frequent that such teeth as fall are put out and forced away by other new teeth that begin to appear before the old ones fall away. The like never happens to the stags, whose heads, after having cast their horns, remain as bare as if they never had any, until such time as their new horns grow again.

But for fear so long a discourse of horns should seem tedious, I will conclude it with saying something of the pretended unicorn's horn of *St. Denys*. I have told you that it is altogether, and every where like that of *Denmark*. I will add to this, that the *Danes* are of opinion, (as most certainly it is) that all those kind of horns found in *Muscovy*, *Germany*, *Italy* and *France*, came originally out of *Denmark*, where this sort of merchandize was very frequent, whilst there was a passage between *Norway* and old *Greenland*, and that they constantly cross the seas from one coast to the other. The *Danes*, who brought them to sale in foreign countries, had no reason to declare them to be fishes teeth, but sold them for unicorn's horns, to sell them at the higher rate; this they have not only practis'd formerly, but also continue to do it this day. 'Tis not long since, that the company of *New-Greenland* at *Copenhagen*, sent one of their agents into *Muscovy*, with several great pieces of these kind of horns, and amongst the rest, one end of a considerable bigness, to sell it to the great duke of *Muscovy*. The great duke being extremely taken with the beauty thereof, he shew'd it his physician, who understanding the matter, told the great duke, 'twas nothing but the tooth of a fish; so that this agent returned to *Copenhagen* without selling his commodity. After his return, giving an account of the success of his journey, he exclaimed against the physician, who had spoiled his market: by disgracing his commodities: Thou art a half-headed fellow, replied one of the directors of the company, (as he told me since) why didst thou not offer two or three hundred ducats to the physician, to persuade him that they were the horns of unicorns? You need not doubt, sir, but that the horn of *St. Denys*, did come originally from the same place, and was sold in the same manner. I can't exactly tell you the time since I saw it; but if the remembrance of the idea that remains in me, deceives me not, 'tis a tooth like those

The horn of St. Denys.

These were sold for horns of an unicorn.

those they show in *Denmark*; for it has the same root as the rest, hollow and worm-eaten at the end like a rotten tooth; this being granted, as it is really true, I will positively affirm it to be a tooth fallen out of the jaw-bone of the same fish known in *Island*, by the name of *Narbual*, and that consequently it is no horn.

But it is time to return into *Greenland*: The chronicle of *Island* tells us, that the air of *Greenland* is milder and more temperate than in *Norway*: That there is not so much, nor such frequent snow, neither the cold so excessive; not but that it freezes very hard, and sometimes they have grievous tempests; but those violent frosts and great storms happen not often, nor do they continue for any considerable time. The *Danish* chronicle mentions it as a very strange thing, that in the year 1308, they were afflicted with such dreadful thunders and lightening in *Greenland*, that a church named *Skalbalt*, was burnt to the ground: That this thunder and lightening was followed by such a prodigious tempest, that it overthrew the tops of several rocks, which cast out such abundance of ashes that they fancied it rain'd ashes. This tempest was succeeded by an excessive cold winter, the like whereof had never been known in *Greenland*; the ice continuing a whole year without melting. One time as I was relating this stupendous rain of ashes to my lord ambassador, he informed me, that being at *Rochel*, a sea captain lately come from the *Canaries*, assured him, that lying at anchor about six leagues from those islands, there happen'd to fall just such a shower of ashes, which lay as thick upon the deck of his ship, as if it had snowed very hard. The cause of this sudden accident was attributed to a violent earthquake, which having shaken the fiery mountains in the *Canaries*, the ashes were by the wind carried six leagues into the sea. 'Tis very probable, that the ashes cast out from the *Greenland* rocks proceeded from the same cause, and that there are in that country sulphurous mountains and subterraneous places, which burn like these of the *Canaries* and elsewhere. This may be verified by the neighbourhood of mount *Hecla* in *Island*, which lies much more northerly than this part of *Greenland*, as also by several instances of other fiery mountains in *Lapland*, much farther than the *Arctic* circle: Besides, what questionless you may have taken notice of before, in the old description of that country, viz. That there are baths there of such an excessive heat, that they are useful only in winter.

The summer in *Greenland* is always plea-

sant both night and day, if that continual twilight, that in summer abides all the night in the air, may be called night. As the days in winter are very short, the nights are consequently very long. Besides that, nature produces there a wonder which I should scarce relate upon my own credit, did not the *Island* chronicle record the same as a miracle, and had I not an entire confidence in monsieur *Relis*, who did read and interpret it to me.

In *Greenland* with the beginning of the night, a certain light arises either with the new-moon, or just before it, which gives light to all the country, in the same degree and manner, as if it were full moon; and the darker the nights are, the more conspicuous the light appears. It takes its course towards the north, whence it is called the *Northern-Light*. It appears like a flying fiery meteor, streaming along in the air, as a high and long palisado. As it moves from one place to another, it leaves behind it a smok in those places, through which it had passed; its swiftness being such, that none but such as have seen it are able to imagine it. It lasts all the night, and vanishes with sun rising. The enquiry into the true cause of this meteor, I will leave to those who are better versed in natural philosophy than myself, whether certain vapours arising out of the earth, enflamed by a continual motion, are not the most probable cause thereof, as we see with the same swiftness those long fuzes or fiery tongues to kindle, which fall from, or pass thro' the sky, or in the same manner as the flaming meteors fly about the church-yards. I have been told for certain, that this northern light is plainly seen as far as *Island* and *Norway*, when the air is clear, and the nights not clouded with any mists: It gives light, not only to the people of this northern climate; but also discovers itself in our parts. Doubtless this light is the same which I have heard mention'd by the most learned and judicious philosopher monsieur *Gassendi*, to have been frequently seen by him, and named *Aurora Borealis* or the *Northern Twilight*. The most remarkable that he ever saw, was that seen all over *France*, *silente Luna*, or about the new-moon, (for it was but one day old) in the night betwixt the 12<sup>th</sup> and 13<sup>th</sup> of September, Anno 1621. He has mentioned it only *en passant* in the life of monsieur *Peregrin*, but described it at large, more compleat in his learned observations, and at the end of his exercitations against Dr. *Flud*, whither I refer you, to avoid proximity; and to return to my former relation.

The

The *Danish* chronicle says, that in the year 1271, a violent wind from the north east forced such a vast quantity of ice shoals laden with bears and wood to the coast of *Island*, that from thence they conjectured, that what was discovered in the west of *Greenland*, was only a small part thereof; and that it extended a great way farther to the north-east. This persuaded some seamen of *Island* to venture upon this discovery, but could meet with nothing but ice shoals; some kings of *Norway* and *Denmark* having a long time before the same thought and design in their heads, they had sent thither several ships, nay some of them went thither in person, but with no better success than the seamen of *Island*: What had induced them to attempt this voyage, was either the fame, or the general received opinion grounded upon certain reports that this countrey abounded in veins of gold and silver, and precious stones. Or perhaps that passage in *Job* had made some impression upon their mind, *Gold comes from the north*. Upon which account I can't forbear to tell you what the same *Danish* chronicle says upon that subject, viz. that in former times certain merchants return'd from thence with great riches. It says also, that in the reign of *St. Olavs* king of *Norway*, some mariners of *Friseland* undertook that voyage for the same purpose; but being by violent tempests forced among the rocks of this coast, they were forced to shelter themselves in some creek. He further tells us, that when they adventured ashore, they found not far from the sea shoar some ill built huts or cabins half under ground; and about those cabins a great many mineral stones, glittering like gold and silver ore, which made them resolve to take a good quantity along with them. In effect every one of them having taken as much as they could well carry away, as they were marching off to their ships, they saw coming out of these under-ground huts, a good number of ill shap'd and ill look'd fellows, resembling more the devils than men, with their bows and slings, and great dogs at their heels. This oblig'd these mariners to hasten their pace, to preserve both themselves and their treasure; but one of them loitering behind, had the misfortune to fall into the hands of those salvages, who tore him immediately in pieces, in the sight of his companions. This *Danish* author adds, that this countrey is full of riches, and therefore 'tis commonly said, that Saturn has hid here his treasures, and planted a set of devils here to guard them.

In the *Island* chronicle he has a peculiar chapter intitled, *The course and navigation from Norway to Greenland*. The course

Vol. II.

into *Greenland*, according to the account given by the most skilful pilots, born either in *Greenland*, or returned from thence lately, is as followeth. From *Nordstadenfundmur* in *Norway*, you direct your course towards the west, till ye come to *Horensunt*, on the eastern side of *Island*, is seven days sail. From *Susfuels Jokel*, a sulphureous mountain of *Island*, to *Greenland*, the shortest way is to sail towards the west. Half way between *Island* and *Greenland*, lies *Gundebuirne skeer*. This was the old passage before the ice from the north rendred this navigation very dangerous. 'Tis also recorded (but in a separate paragraph) from *Langueries* to *Island*, (which is the most northerly part towards the pole) are eighteen leagues to *Ostrebörn*, which signifies the eastern born. From *Ostrebörn* to *Hualsbredde*, is twice twenty four hours sail. I would not have any body to undertake a voyage into *Greenland*, according to this direction; the same having always been, as far as I was able to learn, very difficult and dangerous; you may perhaps have taken notice of this from what I have said before, of the return of *Leiffe* into *Greenland*, to his father *Erick*, surnamed the red hair'd, from the foremention'd shipwreck of bishop *Arnold*, and the disasters that befel the mariners of *Friseland*. The same *Island* chronicle has another chapter, entituled, *A copy taken out of an old book, call'd, Speculum Regale, or, the Royal Looking-glass*. Concerning the affairs of *Greenland*, the contents whereof are plainer than the former; it says, that in former days three large sea-monsters of a strange shape, were seen in the sea of *Greenland*. The first was by the *Norwegians* call'd *Haffstramb*, which appear'd from the girdle upwards above water; its neck, head, face, nose and mouth, were altogether like those of a man, only the head was extraordinary high, and pointed towards the crown. It had very large shoulders, and at the extremities thereof two stumps like arms, but without hands. The body was but slender towards the middle, and keeping constantly under water, below the girdle, none ever saw the whole shape of this monster. Its countenance appear'd like ice, and as often as it was seen above water, it prov'd the forerunner of violent storms.

The second monster was call'd *Marguer*; in shape (as far as the girdle) not unlike a woman with large breasts, its hair hanging down behind, large hands, at the extremities of its stumps of arms with long fingers join'd together, with a skin like the feet of geese. Sometimes this monster has been seen holding a fish in its hands upon which it fed. It always portended an ap-

monster.

proaching violent storm; if it dived under water with the face towards the mariners, 'twas a sign they should not be shipwreck'd; but if it turn'd its back to them, 'twas an ill omen, foretelling that they should be cast away.

*The third monster.*

The third monster was call'd *Hafgierrinduer*; being no monster to speak properly, but three mountains of water raised by violent storms, which occasioned a whirlpool, that swallowed up all the ships that had the misfortune to light within this triangular whirlpool, made by the position of these watery mountains, out of which seldom any escaped without shipwrecking. This pretended monster or whirlpool, was occasioned by the currents of the sea, which meeting with turbulent winds contrary to the current, used to surprize and swallow up the ships.

This same book declares, that in this sea are great heaps of ice raised upon one another, appearing at a distance like huge statues of strange shapes: it advises those that go into *Greenland*, to bend their course towards the south west, before they come near the shoar of that country, by reason of the great quantity of ice that swims on these seas, at a great distance from the shoar, even in the summer. It advises those that happen to be entangled among the great ice shoals, to put in practice what others have done in such like emergencies, viz. to put their long boat upon the thickest part of these ice shoals, with all the provision they have, and to stay there till this ice carries them to some land or other, or else it dissolves, when they may save themselves in their long-boat.

*How to escape from the ice shoals.*

Here ends the history of old *Greenland*; but the history of *Denmark* tells us precisely, that in the year 1348, a furious plague, call'd the *black pestilence*, carried away the greatest part of the inhabitants of the north, and among the rest, the seamen and merchants of *Norway* and of *Denmark*, that were members of the *Greenland* company in both kingdoms. And it is observable, that from this time on, the voyages and traffick into *Greenland* were discontinued, and began to be lost. Monsieur *Wormius*, as I remember, told me nevertheless, to have read in an old *Danish* manuscript, that about the year 1484, in the reign of king *John*, there were in the city of *Bergen* in *Norway*, above forty seamen living that failed every year into *Greenland*, and brought from thence several commodities of great value: but having refused to sell them to certain *German* merchants, come on purpose to *Bergen* to buy them, these *Germans* (without discovering their design) invited those mariners to a supper,

and destroyed them all in one night. This story as 'tis related carries but little probability along with it; there being at that time no such free and frequent passage betwixt *Norway* and *Greenland*; the narrative I am entering upon being most certain that the trade and traffick which *Norway* and *Denmark* formerly had with *Greenland*, was then either quite decayed, or totally ruined.

You must understand, Sir, that the tributes and customs of *Greenland* were anciently designed and employed to defray the charges of the table of the kings of *Norway*; and that not a mariner durst fail into *Greenland* without leave, upon pain of death. It happened in the year 1389, that *Henry* bishop of *Garde*, went over into *Denmark*, to be present, as I told you before, at the assembly of the states of this kingdom, then assembled in *Funen*, in the reign of queen *Margaret*, who united the two crowns of *Norway* and *Denmark*. It happened about the same time, that certain merchants of *Norway*, who had cross'd the seas to *Greenland* without leave, were accused of having embezzled the tributes and customs belonging to the queen's table. The queen treated those merchants severely enough, for they had been infallibly hang'd, if they had not taken a strict oath upon the holy Bible, that they had been carried over into *Greenland*, not designedly, but by a storm; and that what merchandises they had brought from thence were purchased with ready money, without meddling in the least with the queen's revenues; they were discharged upon this oath. However the severe prohibitions made upon this occasion, together with the danger of the seas, produced this fatal effect, that since that time, neither merchant nor mariner durst venture on this voyage. The queen, some time after, sent thither some ships, which were never heard of since, supposed to be cast away, tho' it was never known either how or where, or in what manner they were lost. This put such a consternation among the old mariners of *Norway*, that none of them could be prevailed upon to venture again upon those seas. The queen being at that time engaged in a war with *Sweden*, and consequently meeting no great account of *Greenland*, was not very forward to force them to these voyages.

The *Danish* chronicle, unto which I stand indebted for this history, says, that about the same time, viz. in the year of our Lord 1406, *Eskild* bishop of *Drumbem* in *Norway*, willing to take the same care of *Greenland* as his predecessors had done before; sent thither a certain person named *Andrew*, to succeed in the place of *Henry* bishop

bishop to send this *Andrew* not the and not could be the least *Henry*. sent from

bishop of *Garde*, in case he was dead, or to send him word if he was alive. But since this *Andrew* took shipping for *Greenland*, not the least news could be heard of him; and notwithstanding all the inquiry that could be made, it was impossible to hear the least tidings, either of him or of bishop *Henry*. This was the last bishop that was sent from *Norway* into *Greenland*.

The same *Danish* chronicle gives us a catalogue of the names of all the kings of *Denmark*, since queen *Margaret*, to the reign of *Christian IV.* the present king, with an exact account of what happen'd in reference to the recovery of *Greenland*, in their respective reigns. It is absolutely requisite, Sir, you should not be ignorant of this succession, and of the fatalities or misfortunes which have made us lose even the knowledge of this renowned country, which in former days was so well known, inhabited, and frequented by the people of our world.

*Erick of Pomerania* succeeded to queen *Margaret*, but as he was a foreigner newly come into *Denmark*, he never took the pains as much as to enquire, whether there was such a country in the world as *Greenland*.

*Christopber of Bavaria* was crown'd next after *Erick*, but being all the time of his reign employ'd in a war against the *Vandals*, then inhabiting *Pomerania*, had but little leisure to look after *Greenland*.

The family of *Oldenbourg*, that now sways the *Danish* scepter, began to reign in the year of our lord 1448. But king *Christian*, the first of that name, and of that race, instead of bending his thoughts towards the north, employ'd them in the south: for going in pilgrimage to *Rome*, he got from the pope the propriety of the country of *Dübmarsen*, to be annexed to the crown of *Denmark*, and leave to establish an university at *Copenhagen*.

*Christian II.* succeeded *Christian I.* and solemnly promised at his coronation, to use his utmost endeavours for the recovery of *Greenland*: but instead of recovering a country lost by his predecessors, he was forced to forsake his own kingdoms. His cruelties having caused him to be driven out of *Sweden*, which queen *Margaret* had united with the two kingdoms of *Norway* and *Denmark*, and establish'd in these three kingdoms but one government. He departed into *Denmark*, with the same furious spirit that had possessed him in *Sweden*, so that the *Danes*, not able to suffer him any more than the *Swedes*, deposed him. Whence it is, that he is represented amongst the kings of *Denmark*, with a broken scepter in his hand. His lord chan-

cellor *Erick Valkanor*, a *Danish* gentleman, remarkable for his virtue, wisdom and wit, being made archbishop of *Druntben* after his master's disgrace, retired to his archbishoprick, where he employ'd his mind and skill in the recovery of *Greenland*. He perus'd all the books that mention'd it: he examin'd all the merchants and mariners of *Norway* that could in the least be supposed to have any knowledge of it, and caus'd a map to be made of the passage leading to it. But just as he was upon the point of putting in execution so laudable a design in the year 1524, a great lord of *Norway* pick'd a quarrel with him, and forc'd him to abandon both his archbishoprick and the kingdom, whence he departed to *Rome*, where he died.

*Frederick I.* uncle to king *Christian*, had took possession of the kingdoms of *Denmark* and *Norway*, and because the faction of *Christian* was not altogether extinct, *Frederick* fearing the interest of *Valkanor*, caus'd him to be driven out of *Norway*, and annull'd the charters given to the respective companies erected for the discovery and recovery of *Greenland*.

*Christian III.* succeeded *Frederick*, who caus'd the passage into *Greenland* to be attempted, but those he sent return'd without being able to find it out. This oblig'd this king to repeal all the severe prohibitions and orders publish'd by the king's predecessors, viz. that none should sail into *Greenland* without peculiar licence. Instead whereof he granted full liberty to every one that had a mind to go thither without his leave. But the *Norwegians* being in those days so weak in shipping, and so miserably poor, were not in a condition to provide ships for so difficult and dangerous a voyage.

King *Frederick II.* inherited with the kingdom his father *Christian III.*'s design. He sent a certain person named *Magnus Heimgingson* to discover *Greenland*. If we may rely upon the author's credit in reference to this voyage, there is a secret and hidden cause unknown to all the world, that visibly stops and hinders the designs of recovering this country. For after *Magnus Heimgingson* had wandered and pass'd through many difficulties; he discovered *Greenland* at a distance, but could not come near it, for as soon as he had made the coast, his ship stopt immediately, at which he was astonish'd (and not without reason) for it was in the main sea, in a great depth of water, without any ice; besides, the wind blew fresh and fair, and the ship was under full sail. Thus being unable to go forward, he was forced to return to *Denmark*, where he gave an account

of

of what had happen'd to the king; whom he told by way of excuse, that in the bottom of those seas there are rocks of loadstone, which had stopp'd his ship. If he had but known the story of the *Remora*, perhaps he might have alledg'd that as a pretence, more probable than that of the loadstone. This expedition happen'd in the year 1588, or thereabouts, when king *Frederick II.* reigned. Our *Danish* chronicle tracing exactly the sequel of the time, hath inserted between the reigns of king *Christian* and king *Frederick*, a long narrative of the voyage of captain *Martin Forbisher*, an *English* captain, who undertook the discovery of *Greenland* in the year 1577. As this narrative gives us a much clearer insight into the affairs of *Greenland* and of its inhabitants than any other now extant, as far as ever I saw till this time; so I thought it not amiss to send you a translation of the matters contain'd therein.

*The Voyage of Martin Forbisher into Greenland.*

*Martin Forbisher* set sail out of *England* for *Greenland*, in the said year 1577; he discover'd it, but could not land nor come near it that year, by reason of the night, the ice and the winter, which came very suddenly upon him in that voyage. After his return into *England*, he acquainted queen *Elizabeth* with what he had seen. The queen upon his relation thought to have recovered this unknown country. She with the first beginning of the spring, gave him three ships. With these *Forbisher* set sail, and having got sight of the land, came to an anchor on the east side of it. The inhabitants of the country where he landed, fled away at the approach of the *English*, leaving their houses to hide themselves up and down; nay, some of them for fear climb'd up to the top of the sharpest and highest rocks, from whence they cast themselves down into the sea. The *English*, who could never so far prevail upon, or engage these savages to come near them, enter'd into their forsaken dwellings, being properly speaking no more than tents made with skins of sea-calves or whales, spread upon four great poles, fow'd together very artificially with dry'd nerves. They took notice that all those tents had two entrances, the one on the western side, the other towards the south, whereby they sheltered themselves from the winds that most troubled them from the east and north. In all those dwellings, they found nothing but an old woman of a frightful look, and a young woman big with child, whom they took away with them, with a little infant that she held by the hand. As they took them away by force from the old woman, she howl'd and cried most vehemently. From whence they

*The houses of Greenland.*

failed along the coast towards the east, and saw a monster upon the water as big as an ox, with a horn at the end of its snout of a yard and a half long, which they fancy'd to be an unicorn. Thence they steer'd their course to the north east, and discovering land, they cast anchor there, the country thereabouts appearing very pleasant to them. And though this place was within the continent of *Greenland*, they named it *Anavavick*, that they might keep it under another name. They found this country much subject to earthquakes, which overthrew great massy rocks, and rowled them into the plains, and that there was no abiding there without manifest danger. However they stay'd there a while, and because they met with a sand, glittering as if it were intermix'd with gold oar; they loaded three hundred tuns of it in their vessels. They did what they could to draw the salvages of this country to a conversation with them, which they seem'd not to be unwilling to; for they answered by signs, to the signs the *English* made to them, giving them to understand, that if they would go higher, they would find what they sought for. *Forbisher* answered he would, and for that purpose took his long boat with some soldiers, giving order to his three ships to follow. He pass'd along the coast higher up, and saw a great number of those salvages upon the rocks, which made him apprehensive of a surprize. The salvages who conducted him along the coast and were ashore, perceiving his jealousy, (that they might not fright him by their numbers) caused three men only to appear from behind an intrenchment, much handsomer and better habited than the rest. These desired the *English* by signs and demonstrations of love to come ashore. *Forbisher* seeing no more than three near the shoar, the rest appearing on the rocks at a distance, row'd towards the shoar without the least fear, but some that were conceal'd in a ditch being impatient (when they saw *Forbisher* rowing towards them) of delay, ran in a croud to meet the *English*; this made him keep off at a distance. However these salvages being not in the least discouraged for that reason, endeavoured still to draw to them the *English*, by casting a great deal of raw flesh upon the coast, as if they had dogs to deal withal. But finding the *English* to be afraid to approach them, these salvages contrived another artifice. They carried a pretended cripple to the sea shoar, and there leaving him they departed, and never appeared for some time, as if they were gone a great way off, or for good and all. They supposed that the *English*, according to the custom

custom of strangers, would come and carry away that weak and infirm man, (who could not easily escape their hands) to make use of him as an interpreter. But the *English* smelling the rat, discharged a musket at the cripple, which rous'd him to that degree, that he was glad to run away as fast as he could set his feet to the ground. Then the salvages flock'd in vast numbers to the shoar, and sending whole showers of stones and arrows out of their slings and bows, the *English* only laugh'd at it, but in lieu thereof gave them a volley of shot and cannon ball that dispers'd them all in a moment.

According to this relation, those salvages are treacherous, wild, and so barbarous, as not to be civilized by flattery. They are gross of body, and of an olive colour; though some are of opinion, that there are amongst them negroes as well as in *Ethiopia*. Their cloathing is of skins of sea dogs sewed together, with dry nerves. Their women walk with their hair loose, they cast it behind their ears to shew their faces, painted with blue and yellow: they wear no petticoats as our women do, but many drawers made of fish skins, which they put one over another; each pair of drawers has its pockets, where they keep their knives, thread, needles, and small looking-glasses, and other trifles brought to them by strangers, or cast ashore by the tide of the sea after shipwrecks, which often happen here. The shifts of men and women are made of the bowels of great fish sewed together with very small nerves. Both sexes wear a kind of loose garments which they girt with straps of the skins of fish. They stink most nauseously, are nasty and filthy: their tongues serve them instead of a napkin or handkerchief, neither are they ashamed of what other men conceal and cover. Amongst them those are reckoned the richest who have most bows, slings, boats, and oars; their bows are but short, and their arrows slender, pointed with bone or sharp horns. They are very dexterous in handling their bows and slings, and in darting at the fish in the water with their javelins. Their boats are covered all over with skins of sea-dogs which hold no more than one man at a time. Their great boats are made of wood fastened together with strong wooden pegs and ribs, and covered with whales skins sewed together with very strong nerves; these boats carry at most but twenty men at one time; their sails are of the same substance as their shifts, viz. of the bowels of fish sewed together with small nerves; and though there be no iron in those ships, they are so artificially and strongly join'd together,

VOL. II.

that they dare adventure in them a great way into the main sea, without dreading the most violent storms or tempests. This country produces no venomous creatures except spiders. They have also abundance of gnats, which with their stings raise large pustules and swellings in the face. They have no fresh water but what they procure from the dissolved snow.

The author of this chronicle is of opinion, that the violent frosts bind and stop the veins of the earth to such a degree, as to hinder the passage of all fresh water springs. Their dogs are of an extraordinary size, so that they couple them together, and use them to draw their carriages in the same manner as other people do with their horses.

Here ends this relation, which whether this *Danish* author has taken out of the *English* travels of *Martin Forbisber*, or whether he has written by hear-say, in imitation of those ancient *Danes*, who made up and compos'd the history of their times according to the tales that were spread abroad in the world, I am not able to determine. But it is time to return to the kings of *Denmark*.

*Christian V.* son of *Frederick II.* undertook once more the business of *Greenland*, resolving to leave no stone unturn'd for the discovery thereof, notwithstanding the ill success his father and grandfather had met with in this attempt: in order to this design, he sent for a captain and skilful pilot from *England*, both well acquainted with those seas, and the course they were to take in this voyage. The captain and pilot being arrived in *Denmark*, three stout ships were equipp'd, and committed to the conduct of *Gotiske Lindenau*, a *Danish* gentleman, as commodore, who set sail from the *Sound* in the beginning of the warm season in the year 1605. These three ships kept together for some time, till the *English* captain being come to the elevation he long'd for, he steer'd his course towards the south west for fear of the ice, that he might with the more safety and convenience approach the coast of *Greenland*. The course he took seem'd suitable to the ancient passage from *Island* mention'd before. The relation whereof gives the same directions. The *Danish* commodore judging the *English* captain to have taken the wrong course to the south west, steer'd his course to the north east, and arriv'd alone with his ship in *Greenland*. As soon as he cast anchor, divers salvages that had discover'd him from the high shoar, (where they inhabited) leap'd into their little boats, and came on board him. He receiv'd them with a great deal of civility, and welcomed them

them with several bumpers of excellent wine; but these savages fancying it to be bitter, made very ugly faces at it; but seeing some whale oil, they desired something of that; accordingly great pots being fill'd with it, they did drink them off very greedily. These salvages brought skins and furs, of foxes, bears, sea-calves, and a great many horns, (which the author calls precious) or at least some pieces, ends and stumps of them, which they exchanged for needles, knives, looking-glasses, buckles, and other such like trifles, which the *Danes* shewed them: They making not the least account of the gold and coined silver that was offer'd them, but express'd an earnest desire for all steel works, a thing most in request among them, above all other commodities. To purchase which they were ready to part with what they esteem'd most precious, viz. their bows, arrows, boats, and oars, and when they had nothing else to give, they stripped themselves of their shirts. *Goske Lindenau* continued three days in this road, but the chronicle does not say that he landed here. Doubtless he was afraid to venture ashore, and to hazard his small number of men amongst such multitudes of salvages of this country. He weighed anchor and departed the fourth day, but before he set sail, detain'd on board his vessel two of those salvages that were come to traffick with him, who made such violent efforts to get out of the hands of the *Danes*, that they attempted to leap over-board into the sea, so that they were forced to bind them. Those that remained a shore, seeing their companions chained and carried away, made a most dreadful noise, and sent whole showers of arrows and stones after the *Danes*; but these firing a great gun at them, they were soon dispersed. The commodore return'd alone with his ship into *Denmark*.

Davis's  
gulph.

The *English* captain with his and the other *Danish* ship arrived in *Greenland* (as the chronicle tells us) at the furthestmost end of the land to the west, which could be no other place but *Cape Farewel*: For 'tis most certain that he enter'd *Davis's* gulph, and sailed along the eastern coast of that gulph. He discovered a great many good harbours, a beautiful country, and large verdant plains. The salvages of this part of the country barter'd with them, as the salvages of the other part of *Greenland* had done with *Goske Lindenau*. These indeed seem'd to be much more wary, timorous and mistrustful than the others, for as soon as they had made any exchange of goods with the *Danes*, they would run and leap into their boats as if they had stolen them, or as if they had been pursued by

an enemy. The *Danes* being very desirous to land in one of these harbours, went ashore well provided with all sorts of weapons. The country where they set foot ashore, appear'd to them pleasant and pretty good, but sandy and stony like the grounds in *Norway*. By the exhalations and vapours that issued out of the earth, they concluded that there were divers sulphureous mines here, especially since they found a great many stones supposed to be long to the silver mines which they had carried over into *Denmark*; where out of one hundred weight of these stones, they extracted twenty six ounces of silver. This *English* captain finding so many fine harbours along this coast, gave them *Danish* names, and caused a map to be drawn of them before his departure thence. He also seized four of those salvages, the most comely they could meet with, one of which was so enraged at his captivity, that the *Danes* finding they could not drag him along with them, they beat out his brains with the but end of their musquets, which so irighted the other three, that they followed them without any farther opposition. At the same time a body of salvages got together, either to revenge the death of him that was kill'd, or to relieve those that were leading away into captivity. To effect this, they got betwixt the sea and the *Danes*, with an intention to engage them before they could reach the harbour, and prevent their getting on board. But the *Danes* having sent a volley of their small shot, seconded by their cannon, among them, the salvages frighted both with the noise and the fire, fled in great confusion, suffering the *Danes* to embark without any farther disturbance; who were no sooner got on board, but they weighed anchor and returned into *Denmark* with the three salvages, whom they presented to the king their master, who declared that he thought them much better shaped, and less barbarous, than those two *Goske Lindenau* brought along with him, being also very different from them in their habit, language and manners.

The king of *Denmark*, well satisfied with this first voyage, resolved on a second. Accordingly the next year 1606, he sent the same gentleman *Goske Lindenau*, with five good ships into *Greenland*: He set sail from the Sound the 8<sup>th</sup> day of May, carrying along with him the three salvages, the *English* captain had taken in *Davis's* gulph, for to make use of them as his interpreters. Those poor harmless creatures express'd an unspeakable joy when they understood that they were returning back into their own country. One of them fell sick at sea, died, and

was cast over-board. *Goske Lindenau* steering his course directly towards *America* (as the *English* captain had done before) came to the south-west point of the gulph of *Davis* by cape *Farewell*. One of his five ships lost her company in a mist, but the other four arrived in *Greenland* the 3<sup>d</sup> of *August*. In the first road where the *Danes* cast anchor, the salvages appear'd in great numbers near the shore, but would not traffick with them, so that as they seem'd to be afraid of the *Danes*, those likewise would not trust them.

The salvages  
are jealous  
of the  
Danes re-  
sist to  
traffick  
with them.

This obliged them to hoist their sails, and go up higher to another place, where they met with an harbour much more commodious than the first, but the inhabitants were as ill-humour'd as the former; for, being jealous of the *Danes*, they threatned to fight them if they offer'd to set foot on shore. The *Danes*, not willing to trust these any more than the others, or venture upon a landing, sail'd farther; and as they coasted along the shore, these salvages rowed along in their small boats, and following them at some distance; the *Danes* found a means to surprize, at several times, six of these salvages, whom they carried aboard in their boats belonging to their ships. It happen'd that when the *Danes* had cast anchor at the third road, a servant of *Goske Lindenau*, a bold fellow, earnestly entreated his master to suffer him to go alone on shore, in order to try the temper of those salvages, alledging, that he hoped either to intice them by the commodities he would carry along with him, or to save himself by flight if they had any mischievous design against him. The

A bold ad-  
venture to

er.

admiral yielded at last to the importunity of his servant, but no sooner had he set his foot on the shore, but he was taken, kill'd and torn in pieces by these salvages, who after this tragedy withdrew from the shore, sheltering themselves behind the hills, beyond the reach of the *Danish* cannon. The knives and swords of these salvages are made of the horns or teeth of fishes, commonly call'd unicorns, sharpen'd with stones, and are as keen as if they were of iron or steel. *Goske Lindenau* being convinced that he was not likely to get much advantage by staying in this country, set sail for *Denmark*, but one of his *Greenland* prisoners was so much afflicted at his removal from his native country, that in despair he cast himself over-board into the sea, and was drown'd.

The *Danes* in their return home met with the first ship that was separated from them in this voyage, but did not keep together above five days, when by a most violent storm they were again separated and scatter'd from one another in such a manner, that they did not meet again till a month after the storm ceas'd. After much labour,

hazard, and a thousand difficulties, they return'd to *Copenhagen* the 1<sup>st</sup> day of *October* following.

The king of *Denmark* having taken a resolution, undertook the third and last voyage into *Greenland*; he sent two great ships under the command of a certain captain, a native of *Holstein*, named *Karsten Rickbardsen*, who took into his service some of the best mariners of *Norway* and *Island*, who being well versed in those seas, were to serve him as guides in the dangerous enterprise. The chronicle says, this captain set sail from the *Sound* the 13<sup>th</sup> day of *May*, without mentioning the year, which I could never learn. The 8<sup>th</sup> day of *June* following, he discovered the tops of the mountains of *Greenland*, but he could not come near the shore, by reason of the vast ice shoals that were settled near to the shore, and extended a great way into the sea. The ice being heap'd upon one another, appear'd at a distance like mountains or high rocks. Upon this occasion the author observes, that some years the ice of *Greenland* never melts all the summer. Thus the captain of *Holstein*, finding no means to approach the shore, and being besides this separated by a storm from the other ship, before he came to these vast ice mountains, was obliged to return without being able to encompass his design. However, the king of *Denmark* was pleas'd to admit of his excuses, and the difficulties he alledg'd in his behalf. Perhaps you will be curious to know what became of the four first salvages, and of the five last, the remnants of all they had taken in the two first voyages into *Greenland*: I will give you, sir, a brief account of them.

The third  
adventure

Is prevent-  
ed to ap-  
proach the  
shore by  
the ice.

The king of *Denmark* appointed certain persons to take particular care of their food, and to look after them, with this proviso, however, that they should be at liberty to walk where they pleas'd. Their food was milk, butter, cheese, raw flesh, and fishes, after the same manner as they used to feed in their own country. It being found impracticable to accustom them to our bread, or roasted or boil'd meat, much less to our wines; but they swallow'd nothing more greedily than great draughts of oil, or of whales greafe. They often turn'd their heads towards the north, and by their sighs express'd the desire and affection they bore to their native country; that after their keepers were removed, some of them who could get to their little boats and oars, put off to sea, with an intent questionless to cross the seas; but being surprized by a storm about ten or twelve leagues from the *Sound*, were forced upon the shore of *Schonen*, where being taken by the peasants, they were brought back to *Copenhagen*, where they

they were more strictly guarded by their keepers afterwards, which put them into such a melancholly humour, that they pined themselves to death.

However there being five of these salvages alive, a *Spanish* ambassador came into *Denmark*, the king being willing to give the said minister the divertisement of seeing these salvages to row in their little canoes or boats, they perform'd the same with extraordinary dexterity.

But to give you the best idea I can of the shape of these boats, I would have you fancy the weaver's shuttle, of ten or twelve foot long, compos'd of large whale bones, of the thickness of an inch, or thereabouts, cover'd both within and without, (not unlike the sticks of an umbrella) with the skins of sea-dogs, and sea-calves, stitched together, with the nerves of the same creature.

*Their boats  
and manner  
of using them.*

We must also suppose this engine or boat to have a round hole on the top, in the middle about the compass of both the thighs of a man; and that it grows narrower and narrower by degrees, at both ends proportionably to its bigness, (like our watermen's boats upon the *Thames*.) The chief strength and ingenuity of the whole engine, consisting chiefly in the junctures at both ends, where these whale bones are join'd and fastened together; and in the opening, hole, or circle above, in the circumference whereof all the whale bones from the lowermost parts meet; the demi-circle underneath being fastened to the uppermost circle, or round hole like a rundlet, where it opens towards its paniers: It is farther to be observed, that all the whale-bones underneath and of the sides of the boat either pass thro' or end in this demi-circle; and that every thing is so well join'd together, that what with its light weight, and the good management of the rower, it will bear against the most violent storms at sea.

The salvages, when they are to make use of these boats, get into them by the hole or open, at the top, and stretching their legs towards one or other of these two ends, stop the overtures left with their waists, made of a 3 or sea-calves skins; these they fasten close to their middle, and the hole wherein they sit, and cover their heads with certain bladders or caps tied to the upper part of their waists, that let the weather be never so bad, and the sea never so boisterous; nay tho' they are dip'd sometimes over head and ears, (which often happens) they are never the worse for it, no water entering either thro' their cloaths, or into their boat. Thus they always swim on the surface of the water, and are in less danger in tempestuous weather than a large ship.

They use only one oar, not above five or six foot long, and half a foot broad at both ends, which they manage with both hands, grasping it in the middle where it is round.

I did not tell you without very good reason, that the shape of these boats resembles a weaver's shuttle, it being certain that the shuttle us'd by the most dexterous workmen does not go forward with the same swiftness as these boats do upon the water, by the dexterity of these salvages: The *Spanish* ambassador was extremely delighted to see five of them perform their task with such incredible swiftness, and to cross and pass by one another with so violent a motion, without touching their oars or boats.

The king of *Denmark* being curious to try the uttermost of their strength, order'd a sloop to be mann'd with eight pair of oars, to row against them, but they were so nimble, that the sloop could scarce overtake them. The ambassador was so generous as to give a present of money to every one of these salvages, which they bestow'd in cloaths after the *Danish* fashion: Now some of them bought themselves boots and spurs, and feathers in their hats, offering to serve the king on horseback.

But they were soon after seiz'd with their former splenetick fits; all their thoughts being bent upon their native country. Two of these mention'd before, who got out at sea, and were cast upon the shore of *Schonen*, being not so strictly guarded as the rest, because no body believed they would run the same hazard again, (after their first deliverance) did once more attempt to row in their boats cross the seas, steering their course towards the north; they were pursued as far the entrance of the *Sound*, but could not be overtaken; so that 'tis probable they were lost, it being not likely they could reach *Greenland* in their small boats.

*They attempt to return to Greenland.*

It was generally observed, that these salvages would burst out into tears, as often as they saw a child on his mother's or a nurse's breast; questionless because they were married and could not forget their wives and children, they had been forced to leave behind them.

Those that remained at *Copenhagen* had a strict guard put upon them, which serv'd only to encrease their desire to return to their native country, because they now despair'd of ever seeing it again.

This had such a powerful influence upon their minds, that they all died with vexation, except two who outliv'd their companions about ten or twelve years. The *Danes* did what they could to render their capti-

captivity easy, representing to them, that they were, and always should be treated among them like friends and countrey-men; which seem'd to have some influence upon them.

The next thing they did, was to endeavour to instruct them in the christian faith; but as they could never be brought to learn the *Danish* tongue, and that faith comes by hearing, it was impossible to make them truly sensible of the mysteries of the christian religion.

Some people who had taken particular notice of their actions, did observe them frequently lifting up their eyes towards heaven, and to worship the rising-sun. One of them died at *Colding* in *Jutland*, being employed in fishing of pearls in the water.

For it is observable, fir, that the mussels in *Denmark* are so full of seed pearls, (as they call them) that scarce any are without them; of these mussels, vast quantities are taken in the river of *Colding*; and some among the rest, which contain very good and round ones: The *Greenland* salvage having often mention'd, that they had pearls in his countrey, and that he us'd to be employed in fishing for them, the governor of *Colding* took him along with him to his government, where he gave him sufficient employment in the river; the salvage being an excellent diver, brought up abundance of the best mussels, and for the most part some of that kind, which contained very good pearls; the governor was so pleas'd at this success, that imagining no otherwise, but that in a little time he should be able to sell his pearls by the bushel, he made this poor salvage dive continually for pearls (notwithstanding the rigour of the winter season) to such a degree, that at the last the cold kill'd him.

His companion, now become inconsolable by his death, made shift to get into one of their little boats, and taking the opportunity of the next fair day, cross'd the seas to the opposite shore of the *Sound*, before any body had the least suspicion of his flight; however he was pursu'd and overtaken, but not before he was got betwixt 30 and 40 leagues at sea. Being given to understand by certain signs, that he must have been infallibly swallow'd up by the waves of the sea, before he could reach the *Greenland* shore; he answered by signs, that his intention was to keep along the coast of *Norway*, to a certain light, from whence he would have cross'd over to *Greenland*, by the direction of the stars. After his return to *Copenhagen*, he died for grief. This was the end of the unhappy *Greenlanders*.

They were much the same, as I formerly Vol. II.

ly described to you the *Laplanders*, of a low stature and broad shoulder'd, *forti pectore & armis*, strong limb'd, flat nosed, with large thick lips. The remnants of their boats, oars, bows, arrows, slings and garments, are to be seen to this day in *Denmark*. I had the opportunity of seeing two of their boats with their oars at *Copenhagen*, one at Mr. *Wormius's*, and the other at the landlord's of our ambassador. The said Mr. *Wormius* has also some of their garments made of dogs and sea-calves skin, some of their shirts made of the guts of fishes, one of their vests made of the skin of a bird, with the feathers on it of various colours; as also their bows, arrows, slings, knives, hangers, and their javelins or darts, which they use in fishing, pointed at the extremities (as well as their arrows) with horns, or teeth sharpened at the points. I also saw here a *Greenland* almanack, compos'd of 25 or 30 small canes or reeds, fastened to a piece of a sheep-skin, but the use thereof was known to nobody but the *Greenlanders* themselves.

The kings of *Denmark* being quite discouraged by so many disappointments in these voyages, some merchants of *Copenhagen* entred into a society with some persons of quality (known to this day by the name of the *Greenland* company) in order to prosecute the same design. This company sent in 1636, two ships to the gulph of *Davis*, where they came to a anchor near the shore, which surrounds that bay. They had not been there long, before they saw eight salvages of the countrey coming towards them in their small canoes or boats; coming aboard, the *Danes* laid out their knives, looking-glasses, needles and such like trifles, and the salvages their fur and dog skins, and sea-calves skins; besides a considerable quantity of what they call the unicorns horns.

Whilst they were busy in exchanging these commodities, a cannon aboard one of these ships happened to be discharged at the drinking of a health; the sudden noise whereof put these poor wretches into such a consternation, that they run over-board into their boats, and so put to sea, with such swiftness, that they could scarce well perceive them, till about 200 or 300 paces from the ship. The *Danes*, surprized at their unaccountable fear, gave a signal to these salvages to return, which they did, as soon as they saw the fire and smoke quite gone. Their manner of traffick is thus: Having chosen what commodities they like best, they put them together in one bundle; this done, they put in another bundle what commodities they are willing to exchange for them;

them; and thus adding or diminishing till both parties are satisfied, the bargain is struck at last.

Much about the same time that the *Danes* were busy in exchanging their commodities with those of the salvages, they saw one of these marine unicorns lying upon the shore, where being cast by the tides, it was left wallowing upon the sands. As it is generally reported of these sea-calves, that they love to feed upon grass; so it is likely that these fishes (which may well be call'd sea-oxen) take delight to come now and then ashore.

The salvages had no sooner discovered the prey, but they attack'd and kill'd the fish, and after they had beaten his horn or teeth into several pieces, carried them aboard immediately and sold them to the *Danes*. This fish which appears so defenceless ashore, is very fierce at sea, being the same thing at sea to the whale, that the rhinoceros is to the elephant among the terrestrial beasts; for he will engage the whale, and run his tooth into his sides. Some affirm, that they are of such strength as to be able to split a vessel at sea, if they run their teeth against it, and that several ships have been sunk by them.

However this traffick was not the main reason that had induced the *Danes* to bestow such vast charges upon those voyages: The pilot it seems, who was the chief conductor of these ships, had formerly taken notice of a certain tract near the sea-shore on that coast, the sand whereof had both the colour and full weight of gold oar; he thought it best to improve this opportunity, he gather'd as much of it, as the ship aboard of which he was could well carry, and so set sail for *Denmark*, telling the ships crew, that they were all rich enough, if they could come safely thither.

The great marshal of *Denmark*, who was governor and the first establisher of this company, being surpriz'd at their sudden return, the pilot told him, that his ship being loaden with gold, they had done their business beyond expectation. But the great marshal being a person not easily to be impos'd upon, he sent some of this sand to the goldsmiths of *Copenhagen*, who not being able to bring as much as one single grain of gold out of it, the grand marshal was so enraged at the folly of the pilot, that, to give all possible demonstrations that could be to the rest of the company, that he had not the least hand in so gross a miscarriage, he commanded the pilot immediately to weigh anchor, and to throw the whole charge of this pretended gold oar into the *Baltick* sea: The pilot was forced to obey,

but finding himself at once despoiled of all his hopes, died soon after, as it is supposed, for grief.

However, the great marshal had sufficient occasion afterwards to repent of this rash resolution; for (as he told me himself) not long after, such another gold dust or sand being found in the mines of *Norway*, an assy-master, who was lately settled at *Copenhagen*, found means to separate a considerable quantity of gold, in proportion of the oar, so that the *Danes* in all probability, lost a great treasure by the ignorance of the other goldsmiths (in whose skill they confided) who perhaps would not have drawn any gold ever out of the oar of *Pern*.

This was the last voyage undertaken by the *Danes* for the discovery of *Greenland*; in this voyage they brought along with them that great piece of an unicorn's horn, which, as we told you before, the great duke of *Muscovy's* physician discover'd to be the tooth of a fish; which the master of the house, where the ambassador lodged, and who belong'd to the *Greenland* company, shew'd us, being valued at 6000 rixdollars.

The *Danish* ship, at the time of their departure from the *Greenland* coast, seized two of the salvages of that country aboard them, in order to carry them to *Denmark*: After they were come into the main sea, they loosened these poor wretches of their bonds, who guided by a violent desire after their native country, laid hold of the first opportunity, and throwing themselves overboard, did endeavour to reach that shore by swimming, tho' questionless they were devoured by the waves, they being too great a distance from it.

I have hitherto given you an account of what I was able to learn, as well of the *Old* as the *New Greenland*, the first inhabited by the *Norwegians*, the second discover'd by the *Norwegians*, *Danes* and *English*, whilst they were endeavouring to recover the passage in the first. 'Tis very probable that the passage between the *Old Greenland* and *Island*, has been stop'd up by the vast ice shoals forced thither during the extremity of the winter season; and by the strong north-east winds from the *Frozen-Sea*, and gathered into vast ice mountains in these straits; whereby the free passage for ships being quite interrupted, those mariners who were sent in quest after the recovery of *Old Greenland*, were forced to steer their course towards the cape *Farewell*, and the gulph of *Davis*, lying to the east, being that part of the country now known by the name of *New Greenland*; it being certain by so many reiterated trials and experiments, that

the passage betwixt *Iceland* and the *Old Greenland*, has been quite lost, which must be attributed to its being stopped up by the ice mountains.

The *Iceland* chronicle, in that chapter which treats of the old passage, mentions something which seems much to confirm the truth of this assertion, viz. That half ways betwixt *Iceland* and *Old Greenland*, there were a considerable number of small rocky isles, frequented only by bears; betwixt which, it is likely, these ice shoals might be forced in betwixt those rocks, with such violence, and in such vast heaps, that the sun being not strong enough to melt them in the summer season, they became in process of time to be petrified, and consequently stop'd up the whole passage into the *Old Greenland*; so that ever since there has not been the least news heard of the posterity of those *Norwegians* that settled there.

'Tis not unlikely, that the same plague which raged in 1348, all over the north, being transplanted out of *Norway* into *Greenland*, did sweep away most of their inhabitants, as it happened in divers other countries of the north. I am apt to persuade myself, that *Gottke Lindenau*, who, as I told you, steer'd his course to the north-east, in his voyage, did either actually come to the shore of the *Old Greenland*, or at least very near it; and that the two salvages he took in those parts, were actually of the posterity of the antient *Norwegians*, that settled in *Old Greenland*.

On the other hand, I have heard it affirm'd by very considerable persons, who saw and conversed with them at *Copenhagen*, that neither these, nor the other salvages, brought from the gulph of *Davis* (tho' much different both in their manners and language) had any thing either in their language or manners, that had the least relation either with *Denmark* or *Norway*; nay, that the language of those salvages was so far from having any congruity with that of the *Danes* and *Norwegians*, that even they could not as much as understand one word they said.

The *Danish* chronicle takes particular notice, that the three salvages brought from the gulph of *Davis* by the *English* pilot, spoke so fast and thick, that one could not hear them speak distinctly, except these words, *Oxa indeba*; the signification of which words, no body has been able to understand hitherto. 'Tis beyond all dispute, that that part of *Greenland*, known by the name of the *Old Greenland*, is only a slender part of that vast tract of northern land, so often mentioned in this treatise; and, that the shore is opposite and nearest to *Iceland*, as also that the *Norwegians*, who settled

there, did not advance very far into the country, no more than those, who since that time have discover'd the *New Greenland*, did ever advance farther than to the ports, and upon the shore; the most of them (as we told you before) not daring as much as to venture to set foot ashore.

I had it from the lord great marshal of *Denmark's* own mouth, that in the last voyage made thither by the *Danes* in 1636, they by certain signs enquired of the *Greenlanders*, who came to traffick with them, whether there lived another people like themselves, beyond the mountains they saw, about ten or twelve leagues distant from the sea side; whereupon the salvages did give them to understand by certain signs, that there actually lived other men, having no hair upon their heads, on the other side of those mountains; that they were of a giantick stature, with vast bows and arrows, killing all strangers that came into their country. But no real certainty can be given of these people, no more than of the country they inhabit; both the ancient and modern histories being silent in this point; the only thing we are certain of is, that *Greenland* is without comparison of a much larger extent, than has been hitherto discovered by the *Norwegians*, *Danes* and *English*.

I was willing to enlarge my self the more upon this subject, in order to the representing to you two other things: (1.) That it is not very certain, whether *Greenland* is coherent with the continent of *Asia*, near the *Grand-Tartary*: (2.) No more, than whether it be contiguous to *America*. Concerning the first, I can tell you, that the vast ice mountains near *Nova-Zembla*, have hitherto so infested the passage thereabouts, that no body has been able to determine, whether there be a passage that way into the sea of the east; for tho' the most skilful pilots and mariners have been employed in finding it out, they could never come beyond the cape of *Spitzbergen*, accounted by the *Danes* a part of *Greenland*, whereabouts, they catch most of the whales transported afterwards into *Europe*: The *Dutch* here have their huts for the management of their trade, and with other nations send thither ships every year.

I can't upon this occasion forbear to give you an account of what I had the honour to learn from the grand-marshal of *Denmark's* own mouth, concerning this part of *Greenland*, and the adjacent sea; nay, such was his generosity, that not satisfied to have told it me by way of mouth, he would give himself the trouble of writing it in a letter to me, which I carefully preserve as a glorious proof of his generosity and

and favour towards me, in hopes of meeting before long, with a favourable opportunity of showing the same to you. But what do I say of showing you his letter, when there is so great a prospect, that you may suddenly see his excellency in person; it being at present reported here at the *Hague*, as a thing unquestionable, that this great person, with the countess *Eleonor* his spouse, the daughter of the king of *Denmark*, are gone lately from *Copenhagen* to *France*, where this great personage is to reside with the character of ambassador extraordinary from his majesty of *Denmark*: This is the same great person, of whose most excellent qualifications, I have sent such ample praises to our dear friend Mr. *Burdolat*, when I gave him an account of that famous interview betwixt the two plenipotentiaries of *Sweden* and *Denmark* at the bridge of *Brensbroe*, on account of a negotiation of peace, betwixt the two northern crowns; which was at last happily concluded by the intercession and indefatigable care of my lord ambassador from our most illustrious king: This interview was one of the most glorious that had been seen for a long time, where the two greatest men of the two northern crowns, viz. the grand marshal of *Denmark*, and the lord chancellor of *Sweden*, did meet one another with an inexpressible veneration, and all the marks of a most generous courage; and our ambassador had there the honour to establish a most intimate friendship between those two great personages.

Of the lord chancellor of *Sweden*, I shall have occasion to speak upon another occasion, and it is beyond my present purpose to enter upon a panegyrick of the grand marshal of *Denmark*; so I will only assure you, that whenever you shall have the opportunity of seeing this great minister, you will be satisfied both in respect of his extraordinary courage and refined wit, and by his noble presence, that he not only deserves the honour of managing all the affairs of moment in the north, but also of a far greater empire.

Add to these his historical virtues, that he is a compleat philosopher who disdains all pomp and vanities, but in lieu hereof is endowed with the most generous inclinations in the world, which renders his conversation the most agreeable in the universe. This great person had in his service, among many others, a certain *Spanish* gentleman named *Leonin*, who being a great naturalist, he sent him to *Spitzbergen*, in order to give him an account of what observations he could make there; whereof I will give a brief account.

This country is situate under the 78

degree of elevation, and not improperly call'd *Spitzbergen*, i. e. peaked Mountains, from those peaked mountains wherewith it is covered. These mountains are a mixture of sand, or rather gravel, and small flat stones joined pretty close together, not unlike that which we commonly call the grey *Ardoise* stone. The mountains increase in bulk every year, so as to be plainly discovered by those who sail that way; *Leonin* went ashore, as deep into the country as he durst venture, and found the whole country, as far as his eyesight could carry, all covered with these peaked hills; and met with no living creature except some few foxes; he was not a little surprized to discover upon one of these hills, about a league from the seaside, a small mast of a ship, with one of its pulleys still fastened to it; this made him ask the seamen how that mast came there, who told him they were not able to tell, but were sure they had seen it as long as they had used that coast. Perhaps formerly the sea might either cover or come near this mountain, where some ship or other being stranded, this mast is some remnant of that wreck.

They have some grass, but so short, that it is scarce to be seen above ground, or beyond the stones; for to speak properly, here is scarce any earth, but only small stones or gravel, betwixt which comes forth a sort of moss, like that which grows upon the barks of trees, in other parts of the northern climate, which serves for food for the ree deer, and is so nourishing to them, that they become absolutely fat by it; and I remember, that the grand marshal had once one of these creatures kill'd, which had at least four inches of fat.

This country is a desert, and not habitable, by reason of the excessive cold; for though the sun does not set here for four whole months in the year; and that for six weeks more, it does not go below the horizon above three eels: To speak after the *Danes*, who seem to have taken their mensuration of the heaven from *Virgil*; meaning that at midnight (if you may so call it) the sun does approach only within eleven degrees and half of the horizon in this country for the space of six weeks: As the cold is very fierce here, so the sunbeams are very bright and piercing, and consequently this subtilty of the air, increases the effects of the cold.

There is no living near these mountains, which scarce having any solidity, they constantly send forth certain exhalations, which pierce the whole body in a very little time; to prevent which, the best remedy is to expose yourself to the sunbeams

They have great quantities of bears in that country; they are all white, some living in the water, others upon the shore. They are commonly seen swimming a good way out at sea, or else upon the great ice shoals. The grand Marshal had caused several of these creatures to be taken alive, which he kept at *Copenhagen*; and when he had a mind to shew some sport to his acquaintance, they used to take a walk along the sea-shore, and in some sandy but deep place where the water was very clear, cause these bears to be thrown into the water, where they could see them dive quite to the bottom; he told me, that it was one of the best diversions in the world, to see those creatures plunge themselves down to the bottom of the sea, and to sport there for two or three hours successively; nay, he believed they would have continued there for a whole day, had they not been drawn out by the ropes and chains that were fastened round their bodies.

Whales of  
Spitzber-  
gen.

The sea of *Spitzbergen* produces abundance of whales of such a bigness, that some taken hereabouts have been found to be no less than two hundred foot long, and of a proportionable bigness in the circumference of their bodies. But they frequently take those of a hundred and thirty and a hundred and sixty foot long. These vast creatures have no teeth, and within these vast bodies they seldom find any thing except ten or twelve handfuls of a kind of small black spiders, progenerated by the corrupted air of the sea, and some small quantity of green herds tore up from the bottom of the sea; it is most probable that these whales don't live upon these spiders, neither upon these herbs, but upon the sea, which produces both; the sea hereabouts being so covered with these insects, that it appears quite black, an infallible sign to those who go about catching of whales, that they are likely to make a good booty; the whales generally delight in that part of the sea which produces these insects.

Sometimes they take of these whales in so vast numbers, and of so prodigious bigness, that the ships are not sufficient to carry all the lard, but are forced to leave part of it behind them, in order to carry it away the next year.

It is observable that never any thing corrupts or putrifies in this country; even the dead carcases buried thirty years before, appear as entire and as well coloured as they did at the same moment they gave up the ghost.

Here are certain huts erected a long time

Vol. II.

2

ago for the convenience of boiling the whale oil or grease; these appear the self-same, without the least alteration, now, as they did from the beginning, when they were built, the wood being as firm and as fresh, as it was the day it was cut from the tree. To speak the truth of these northern parts, the dead fare better here than the living; for if the first don't corrupt, the living don't keep long in health; witness poor *Leonin* (before mentioned) who returned from this voyage so cramp'd with cold, that he lived not long after.

All the birds you meet with here, are water-birds, there being not one kind of them living upon land. They have ducks in great abundance, besides divers other sorts of water-fowl not known to strangers. The grand marshal of *Denmark* has several of them by him stuffed out, it being impossible to bring them to *Copenhagen* alive. Their feathers and beaks are not unlike those of the *Paroquets*, and their feet are like those of the ducks. Those that have taken them, assure us, that they sing very deliciously, especially when many of them sing together, they make a most harmonious noise.

Those that failed to *Spitzbergen* to catch whales, arrive there in the month of *July*, and return from thence in *August*. If they come before *July*, they can't approach the shore, by reason of the vast ice-shoals, and for the same reason they must not venture to stay longer than about the middle of *August* at farthest; for nothing is more frequent than to see vast ice-shoals in these seas, sometimes 60, 70 or 80 fathoms thick.

—*Quæ tantum vertice ad auras  
Æthereas tantum radice ad Tartara tendunt.*

For in certain places near this shore, the ice-shoals are so thick, that they reach the bottom of the sea, and these encreasing by degrees, by the occasion of new ice-shoals, arise as high above the surface of the water, as they are deep below it. These ice-shoals are as bright and transparent as glass: What renders the navigation hereabouts most dangerous is, the uncertainty of the currents, occasioned, as I suppose, by the sudden melting of the ice, which sometimes congeals and melts in different places, at no great distance, at the same time.

It ought therefore not to seem strange to you, if I am not able to resolve absolutely the first proposition, viz. whether *Greenland* is coherent to the continent of *Asia*, and the *Grand-Tartary* or not, by reason of the vast distance there is between us and the *Frozen-Sea*; the uncertainty of the melting

5 P

melting

Uncertain-  
ty about

whether a  
continent  
or isle.

melting of the ice, the violence of the tempests that reign frequently near these coasts, the uncertainty of the true course to be taken, the dangers you meet with there, and what is worst, the want of all manner of subsistence and conveniences in these deserts: All these taken together, are such insurmountable obstacles, as render this discovery past all hopes of success. The second proposition being involved in no less difficulties than the first; we can with no more certainty affirm of this, than of the former, whether *Greenland* joins with the continent of *America* or not.

Of this I can give you not a more convincing proof, than what I intended to oblige you with, viz. The account of a voyage made by a *Danish* captain named *John Munck* (which I promised you long ago) who attempted the discovery of the *eastern passage*, towards the north-west, betwixt *Greenland* and *America*; the same being not in the least foreign to my present purpose; for besides that it contains no small varieties, it has a particular relation to *Greenland* and the adjacent isles.

Munck's  
voyage to  
discover a  
passage be-  
tween  
*Greenland*  
and *Ame-  
rica*.

The king of *Denmark* (that now reigns) being prevailed upon to encourage by his authority, the discovery of a passage to the *East Indies*, thro' a supposed strait betwixt *Greenland* and *America*, engaged one captain *Munck* to undertake this voyage. A certain *English* captain named *Hudson*, had some time before attempted the discovery of this sea and straits with the same design, but was lost in the voyage, tho' no body knows how; it is likely that his boldness having some relation to the presumption of *Icarus*, his wings were render'd useless by the cold, as the others were by the heat of the sun, and so met with the same fate of perishing in the sea; which like that of *Icarus*, got from him the name of *Hudson's straits*, and *Hudson's bay*.

Captain *Munck* set sail from the *Sound* the 16th of *May* 1619, with two vessels, equipped at the charge of the king of *Denmark*, one mann'd with forty eight, and the other with sixteen men. He arrived the 28th of *January* on the cape *Farvel* (as the *Danes* call it) i. e. *Farewell*; having got its name questionless from the opinion the *Danes* have conceived, that such as go beyond it, are passing into another world, and take a long farewell from this part of it. This cape *Farewell*, as I told you before, lies under 60 degrees and a half of elevation, in a mountainous country, covered always with snow and ice; and as these vary frequently in colour, and with their whiteness and transparency dazzle the eye, the true shape of this cape has not been discovered hitherto.

From this cape captain *Munck* steering his coast to the west by north, entered *Hudson's straits*, where meeting with a-bundance of ice, he avoided the danger thereof, by keeping out at sea. Hence it is that he advises those that will attempt this passage, not to go too far to the west, by reason of the many ice shoals, and impetuous currents that are near the *American* coast. He tells us, that the eighth of *July* there arose so thick and strong a frost in these seas, that all his ship tackling were covered with ice-tags, so that they were scarce able to manage them; but that the next day from three a clock in the afternoon till sun-set, it was so excessive hot, that they were forced to pull off their clothes.

A sudden  
change of  
weather.

Coming into *Hudson's straits*, he gave it the name of *Christian's straits*, after the king of *Denmark* his master; and landed some of his men the 17th of *July* in an isle upon the coast of *Greenland*. Those that were sent to view this isle, assured the captain, that they had discovered some footsteps of men, but no inhabitants. However the next day they saw a whole troop of them near the sea-shore, who being amazed and frightened at the sight of the *Danes*, did run away as fast as they could, but had no sooner hid their arms, they carried along with them, behind an adjacent huge mass of stones, but they advanced towards the *Danes*, and in an obliging manner returned the salute given by them, with this caution however, to keep betwixt the *Danes* and the place, where they had concealed their arms. But the *Danes* found means by several turnings and windings to amuse them so long, till coming near to the stone heap, they seized upon their bows, quivers, and arrows.

Their  
bills.

The poor salvages, quite dismay'd at their loss, did in most submissive posture, and with all the engaging signs in the world, beg the *Danes* to restore them their weapons, giving them to understand, that as they lived upon hunting, and must perish for want of them, they would give them their clothes in exchange for them. The *Danes*, moved with compassion, restored them their arms, which they joyfully received upon their bended knees. The *Danes* to engage them the more, produced their toys, and made some trifling presents to the salvages, who were infinitely delighted with them, and in lieu thereof gave to the *Danes* divers sorts of birds, and some fat of fishes. One of these salvages casting his eyes upon a little looking-glass, in which he saw his face, was so taken with it, that he put it in his bosom, and run away as fast

as his legs would carry him, the Danes having the diversion of laughing at his simplicity, as they had occasion to do soon after at the rest of the falvages, who seeing one of their ship's crew, with black hair and flat-faced, not unlike themselves, mistook him for one of their countrymen, and caress'd him as if they had been very old acquaintance.

Captain Muneck left this isle the next day, being the 19th of July, with an intention to pursue his voyage, but by reason of the vast ice shoals, was forced to return to his old station, but could not get sight of any of the falvages again, tho' they did all they could to entice them to the sea shore, by hanging little knives, looking-glasses, and other toys on small ropes. Whether it was out of fear of the Danes, or that they were forbidden to keep any farther correspondence with them by the chief judge or governour, is uncertain.

Captain Muneck meeting with no men, went often a hunting, and having taken abundance of reen-deer in this isle, he gave it the name of *Reinfundt*, i. e. *the gulph of Renes*, and the road where they lay at anchor, *Muneeckens*, after his own name. This isle lies at 61 deg. 20 min. elevation; where after having set up the arms of the king of Denmark his master, he departed a second time, the 22d of July; but was soon after surprized by such violent tempests, and vast ice shoals, that with much ado he made shift to save himself the 28th of July betwixt two isles, where he cast all his anchors, and for his better security, was forc'd to fasten his vessels with long ropes on the shore.

It was no sooner low water, but the Danes found themselves all upon dry land, and the water beginning to rise again, carried along with it such a prodigious quantity of ice shoals, that had they not been day and night upon their guard, they would have been in greater danger here than in the open sea.

Betwixt these two isles, there was a huge ice shoal, about twenty two fathom high; which being loosen'd from the shore, and broken in two pieces, did sink to the bottom of the sea with so violent a motion, that the waves did arise like mountains, as if it had been a violent tempest, and put our ship in great danger of being swallow'd up by them.

They did not see any inhabitants here, but discovered several foot-steps, and other marks which sufficiently convinced them, that they were either at that time, or had been formerly inhabited by men. They found here divers minerals, and among the

rest, great store of *Talc*, of which they carried off several tons into ships. They saw several other isles thereabouts, which in all probability were inhabited as well as these; but the shore being so rocky and full of ice, that there was scarce ever any thing seen like it, the Danes durst not venture too near them. These isles are situated at 62 deg. 20 min. about fifty leagues within the *Christian's freights*. Captain Muneck gave that part where he lay at anchor, the name of *Harefount*, i. e. *the bay or road or bays*, from the vast number of hares they saw in this isle, and set up *Christian IV.* there, which the Danes generally express by this character C4.

He left these isles the 9th of August, steering his course to the W. S. W. with a N. W. wind, and the 10th came on the southern shore of *Christian's freights*, being the *American coast* itself. Pursuing his course, he discovered a large isle to the N. W. unto which he gave the name of *Sneoculand*, i. e. *the Snow-isle*.

The 20th of August he steer'd his course from the W. to the N. and then (as the journal says) *I took the right course at the elevation of 62 deg. 20 min.* But it being a very thick fog, they could discover no land; tho' as the same journal says, *The freights of Christian is thereabouts not above sixteen leagues broad.* From whence 'tis reasonable to conclude, that it is broader in other places.

Out of the streight he failed into *Hudson's sea*, the name whereof he changed likewise, as he had done that of the freights, giving it two names instead of one; for that part which washes the shore of *America*, he called the *New-sea*, and the other part towards the side of *Greenland* (if it may be supposed to belong to that country) *Christian's sea*.

He steer'd his course as much as possible he could to the W. N. W. till finding themselves at 63 deg. 20 min. elevation; they were so entangled amongst the ice, that they were forced to seek for shelter on the *Greenland coast*, and to pass the winter there; whence it is clear they gave the name of *Muneeckens winter haven*, i. e. *Muneeck's winter haven*, to that road; and to the track of land along the coast, the name of *New Denmark*.

The author of this journal has pass'd by in silence several places they saw in their passage thither, because having inserted their names in a peculiar map, he directs his readers thither for farther instructions. He speaks only of two isles in the *Christian's sea*, call'd by him the *two sister isles*, and of one more much larger than the former, towards

an's  
sea.

Muneeck  
came to an  
anchor betwixt  
two isles.

towards the *New-sea*, unto which he has given the name of *Dikes Oculand*. He advises those that intend to pass the *Christian's freights*, to keep in the middle of the freights as much as possibly they can, by reason of the rapidity of the contrary currents, occasion'd by the flux and reflux of the seas on both coasts, which carrying along with them vast ice shoals, put the vessels in frequent danger of being lost. He adds, that the tides in the *Christian's sea*, keep their certain times, from five to five hours, and that these tides are regulated according to the course of the moon.

Munck's  
Haven.

Captain *Munck* came to an anchor the 7th of September at *Munck's winter haven*, where after having somewhat refresh'd his men, he order'd his ships to be drawn into a little creek near the harbour, in order to have them refitted, and to preserve them against the force of the ice. The next thing they had to do, was to erect some huts, to defend themselves against the extremity of the cold of the approaching winter season, which would not permit them to return homewards at that time. *Munck's haven* is situate at the entrance of a river, which was not frozen in October, tho' the sea was already full of ice near the shore.

The coun-  
try near  
it.

Captain *Munck* says, that the 7th of October he went up the river in a sloop, to view the situation of the adjacent country, but could not go farther than a league and a half, being stop'd by the rocks that are cross the river. Finding the passage by the river thus closed up, he took along with him some soldiers and seamen, and marched along with them about three or four leagues deep into the country, in hopes of meeting with some of the inhabitants, but found nothing like it that way. However, in his return thro' another part of the country, he found a pretty broad and high stone, and upon it the figure of a devil, with his horns and claws very distinctly painted. Near it was a place inclosed with small stones about eight foot square: On one side of this square place he saw a little hill composed of small stones, intermix'd with the moss of trees. On the opposite side of the same square, stood another square stone, not unlike an altar, resting upon two other stones, and upon the altar, he saw three pieces of charcoal laid crossways upon one another.

One of  
their al-  
tars.

Their sa-  
crifices.

Captain *Munck* saw several such like altars in his return, with charcoal upon them, just like the former; and tho' he could not as much as get sight of one single person of the natives, yet was it observable, that near every one of these al-

tars they saw, they observed the foot-steps of men; whence they conjectured, that the natives of the country used to assemble near these altars, to perform their sacrifices, which in all likelihood they celebrated either with fire, or to the fire. They farther took notice, that near those places, where they discovered these foot-steps of men, they found abundance of bones gnawed, which as they supposed, were the remnants of the sacrificed beasts, eaten by the salvages at the sacrifice, after their fashion, or rather torn or gnaw'd to pieces with their hands and teeth, as our dogs do with a bone.

In the woods, thro' which they pass'd, they found abundance of trees, sawed or cut in pieces by iron instruments; as also abundance of dogs muzzled with small twigs of trees. But what confirm'd them most of all in their opinion, viz. That this tent was not destitute of inhabitants was, that they had discovered the marks where tents or huts had been erected in divers places, and many pieces of bears and wolf-skins, as also of stags, sea-calves and dogs-skins, which had questionless served to cover these tents withal; it being more than probable, from what has been said upon this head, that these inhabitants lead a vagabond life, like the *Scytes*, or encamp in troops like the *Laplanners*.

The *Danes* having fix'd their huts, which were to serve them all the winter, began to provide wood to keep themselves warm, and venison for their food. Captain *Munck* was the first who shot a white bear with his own gun, which they eat with a good appetite, and say, did relish and digest very well. They also kill'd abundance of hares, partridges, and other birds, which tho' not express'd by their peculiar names, he says are very frequent in *Denmark*. He adds, that they catch'd also four black foxes, and some sables, a name the northern nations generally give to the sable martins.

What most surprized the *Danes* was, that they discovered in the sky divers phenomena they never observed in *Denmark*. Thus, (as the journal assures us) there appeared the 27<sup>th</sup> of November, three distinct suns in the firmament, tho' it was a very thick and gross air. The 24<sup>th</sup> of January next following, two suns appeared very distinctly; and the 10<sup>th</sup> of December, or the 20<sup>th</sup> of the old stile, they observed an eclipse of the moon about eight a clock at night; and the same night, they saw for two hours together, the moon surrounded by a very bright circle, with a cross in it, dividing the whole body of the moon into four

four parts. This meteor seem'd to be the fore-runner of the ensuing miseries, and almost total destruction of the *Danes*, as you will see out of the following account.

The extremity of the cold began by this time to increase to such a degree, that there lay ice-shoals near the shore of 300 and 360 foot thick; and their beer and wines, nay, even the most spirituous *Spanish* wines and strong brandies, froze from top to bottom in the vessels that contain'd them, which breaking asunder, and the liquors being congealed into entire pieces of ice, they were forced to cut out pieces of them with their hatchets, which being melted, before the fire, they afterwards used to drink; nay, such was the excess of the cold, that if they happened to forget a small quantity of water in any of their tin or leather vessels, they found them certainly crack'd the next morning, in that very place where the water had begun to freeze.

Thus the merciless cold, which even did not spare the metals increased its rigour with such violence, upon the bodies of the miserable *Danes*, that they fell all sick, one after another, their sickness encreasing according to the rigour of the season; for being seized with a violent looseness, they were emaciated to the last degree, till they dropt one after another, there being about the middle of *March* not enough left to keep the guard; so that captain *Munck* himself was forced to stand centinel at his own hut.

The worst was, that this distemper instead of abating did augment with the approach of the spring, when their teeth began to loosen in their gums, and their mouths were so full of ulcers within, that they could eat no bread, except what was steep'd in water. Towards *May*, the miserable remnants of the *Danes* were attack'd by the bloody flux, and such excessive pains in the nervous parts, as if they had been pricked without intermission, with the points of knives. Their bodies did decay visibly day by day, turned livid and black at last, no otherwise than if they had been beaten with sticks, and some of them lost their arms and legs by the violence of the cold. This is properly nothing else than the highest degree of scurvy, a distemper very common, and sufficiently known in the northern parts of the world. Such as died were forced to be kept above ground, the rest wanting strength to bury them.

By this time the want of bread encreasing, they were constrained to dig under the snow, where by good chance they found

Vol. II.

a certain sort of berries, which they did feed upon for some time; but the worst was, that they would not keep in the least, wherefore they were obliged to boil and eat them immediately. The journal mentions the 12<sup>th</sup> of *April* as a very remarkable day, because it then rained the first time, after seven months, there having not fallen a drop of rain in all that time.

The spring rejoiced them with the sight of many sorts of birds, none of which had appeared all the winter long, but their weakness would not permit them to catch or shoot any of them. About the middle of *May* they saw abundance of wild geese, swans, ducks, an infinite number of small birds, partridges, ravens, falcons, and some eagles. Not long after, captain *Munck* happened to fall ill among the rest, and on the 4<sup>th</sup> of *June* was so miserably afflicted with tormenting pains in his limbs, that for four days together he could not stir out of his hut: Not imagining otherwise than that his last hour was near at hand, he made his last will, in which he prayed the next that came to that shore, to bury his body, and to be careful of his journal, in order to deliver it to the king of *Denmark*. But about four days after, finding his strength somewhat recovered, he made shift to peep out of his hut to see whether any of his crew were living or not; and out of sixty four that came along with him, found only two alive. These poor wretches ravish'd with joy to see their captain, revived as it were from the dead, run to him with open arms, and carried him straightways to a fire, wherewith rubbing his joints, they brought him pretty well to himself. They then encouraged one another, resolving to live if possible they could, but how was the difficulty; they were forced to look for food under the snow, where now and then they found some herbs and roots, which had that happy effect upon them, that they began to recover more and more every day. It being then the 10<sup>th</sup> of *June*, the ice began to melt, which gave them opportunity to catch some trouts, salmon and other fishes: Thus what they catch'd by fishing and hunting, furnished them with sufficient food; by which means having now recovered their full strength, they resolved notwithstanding all the difficulties and dangers they were to surmount, to endeavour to get back to *Denmark*; what hastened their resolution was, that about that time the summer season and rainy weather brought ashore such vast quantities of gnats, that they were not able to abide there.

According to this resolution, they left their greatest ship behind them, and embarked

No rain in seven months.

Birds of Greenland.

Captain Munck makes his last will.

Recovered.

Muneeck

with two  
seamen  
only.

bark'd aboard the small frigate, the 16<sup>th</sup> of July, and set sail from the same port, where I told you they had laid up their ships, and was by the captain named *Jans Muneeck's Bay*, i. e. *John Muneeck's Bay* or port, after his own name. Coming into the *Christian-Sea*, they met with abundance of floating ice-bergs, where they lost their sloop, and with much ado got their vessel clear; for having lost their rudder, they were forced to fasten their ship to a vast ice-rock till it could be refitted. The ice beginning to melt they found their sloop again, about ten days after; but this lasted not long, for the sea freezing and thawing again by turns, they got, not without a great deal of trouble, thro' the *Christian Strait*, and thence by cape *Farewel* into the ocean, where they were surpris'd the 3<sup>d</sup> of September, by so violent a tempest, that they were in great danger of being lost; the two seamen being so tired out by the long continuance of the tempest, that being forced to commit themselves to the mercy of the wind and waves, their mast was brought by the board, and with much ado they got the sails out of the sea into the ship.

Arrive in  
Norway.

The fury of the tempest being somewhat allay'd for some days, gave them leisure and opportunity to get the 21<sup>st</sup> of September, into a part of *Norway*, where they came to an anchor with one anchor, the only one they had left.

But when they thought themselves freed from all danger, they were assaulted by another tempest, which put them in more danger than ever they had seen before; however they had the good fortune once more to escape this danger, having found means to run their ship among the rocks, they made shift to get ashore, 'till the fury of the tempest being past, they refitted their vessel, and in some days after got safe into *Denmark*, where captain *Muneeck* gave an account of the success of his voyage, to the king, who received him no otherwise, than if had been returned from the dead.

One might reasonably suppose, that this voyage would put a period to captain *Muneeck's* misfortunes; but his ill fate not tired yet of pursuing so brave a man, the odds of the accident that befel him hereafter ought not to be pass'd by in silence.

After some stay in *Denmark*, (during which time he mused upon his last miscarriage, for want of knowledge of the country) he began to be persuaded within himself that there was still a possibility of finding out a passage to the east that way, and therefore resolv'd to attempt the same

Muneeck  
prepares  
for a second  
voyage into  
Green-  
land.

a second time. But this being a thing of such a nature, as to require the assistance of other people, he engaged divers gentlemen of quality, and rich citizens of *Denmark* in the same design, who entering into a society, they equip'd two vessels, which they committed to the care of captain *Muneeck*.

Having taken effectual care to provide his ships with all necessaries, and to remedy all the inconveniencies he had been made sensible of in his former voyage; when being just ready to depart, the king of *Denmark* demanded the captain (as he was taking his leave of him) the day fix'd for his departure; and thus entering upon the discourse of his late voyage into *Greenland*, the king began to upbraid his conduct, as if his ships had been lost by the captain's ill management. His reply happening to be somewhat rougher than the king expected, he pushed him with his cane against the *Dungh* breast, which the captain taking to heart, *grief* went home to bed, and what with grief and want of food (which he refused to take) died in ten days after.

But it is time to return to the subject, that did lead us into this long digression; from what has been said, it seems to be evident, that there is a long and broad canal, if not an entire sea, betwixt *Greenland* and *America*; notwithstanding which, as we know but very little of that coast, it remains doubtful, whether *Greenland* is upon the same continent with *America* or not; tho' it seems most probable it is not, as I told you before. And captain *Muneeck* was questionless of the same opinion, without which he would never have taken so much pains to engage a whole society of gentlemen to attempt the finding out of this passage to the east.

This leads me to a discovery of the mistake of the author, who has published his dissertations concerning the origin of the *Americans*, which he deduces from the *Greenlanders*; the first inhabitants of which he would make us believe were *Norwegians*, and consequently that the first inhabitants of *America*, were originally of *Norway*. He pretends to justify his opinion by a certain imaginary affinity betwixt some *American* words that terminate in *Lan* and the termination of *Land*, so frequent in the *German*, *Lombard* and *Norwegian* languages, and the resemblance of the manner of living; that is, as he tells you, betwixt the *Americans* and *Norwegians*, who are, if you will believe him, the *Allemanni* of *Tacitus*: But I don't question to convince you of his mistake, by the following reasons: (1.) because the *Norwegians* were not the first inhabitants

The *Norwegians* were not the first inhabitants of *Greenland*.  
habitants what has and Mr. mous anti tracing t of *America* contrary, ginal nat burgb, to americans. in his gu lihood th nent of A well know us imagin in what the langu twixt the contrary y the precece *Norwegian* ced in *A* passage fo rica, than

The Nor-  
wegians  
were not  
the first in-  
habitants  
of Green-  
land.

habitants of *Greenland*, as is apparent from what has been said upon the head before; and Mr. *Wormius*, that learned and famous antiquary of the north, is so far from tracing the original of the first inhabitants of *America* out of *Greenland*, that on the contrary, he believes the *Skreglingers* or original natives of *Greenland*, about *Westernburgh*, to have been descended from the *Americans*. (2.) He is grievously mistaken in his guess, there being little or no likelihood that *Greenland* is joined to the continent of *America*, neither is that passage so well known, nor so easy as he would have us imagine. (3.) He is no less in an error, in what he says concerning the affinity of the languages and manner of living, betwixt the *Norwegians* and *Americans*; the contrary being made sufficiently evident by the preceeding relation: But supposing the *Norwegian* language to have been introduced in *America*; he must find out another passage for these northern people into *America*, than by the way of *Greenland*.

I will not trouble you with the other mistakes this author has been guilty of in several passages of his dissertations, knowing that you are constantly employed in matters of much more moment, wherewith you have obliged the learned world; and as I must look upon it as an eternal obligation, that you would throw away part of your precious time, in reading so unpolished a work, that has so little resemblance to the nicety of your own excellent pieces, I don't question, but that you are as well pleased to have done with reading of this letter, as I am satisfied to have finished it, and to declare to you, that I shall always be

An ADVICE concerning the PHILOSOPHY of these late DISCOVERIES,  
By *W. W.*

THE  
PREPARATIONS  
TO THE  
VOYAGE.

HAVING been for many years importuned, by my honourable and worshipful friends, to undertake the discovery of that part of the world, which is commonly called, *The North-West Passage into the South-Sea*, and so to proceed to *Japan*, and so round the world to the westward; being prest forward withal, by signifying to me the earnest desire the King's Most Excellent Majesty had, to be satisfied therein: I acquainted my much honoured friends, the merchants of *Bristol*, therewith; who, as ever they have been benefactors and advancers of them that pursue the ways of honour (together with the enlargement and benefit of his Majesty's kingdoms) did freely offer to be at the charge of furnishing forth shipping for this purpose. And now being thus enabled, I addressed my self to the honourable Sir *Thomas Roe*, Kt. (as to a learned, and furthest employed traveller by sea and land, this day in *England*) who joyfully presented theirs and mine own voluntary willingness, to do His Majesty service in this kind; who most graciously accepted of the offer; and encouraged me by many favours, in my weak undertakings. Wherefore with all speed, I contrived in my mind, the best model I could, whereby I might effect my design. The adventurers moneys were instantly ready, and put into a treasurer's hand, that there might be no want of present pay, for any thing I thought necessary for the voyage.

I was ever of the opinion, that this particular action might be better effected by one ship, than by two consofited; because in those icy seas, so much subject to fogs, that they might be easily separated; I forbear to speak of storms and other accidents; as that of a rendezvous in discoveries, cannot surely, or without much hindrance be appointed; and that speedy perseverance is the life of such a business: Wherefore I resolved to have but one ship, the ship-boat, and a shallop.

A great ship (as by former experience I had found) was unfit to be forced thorow the ice, wherefore I made choice of a well-conditioned strong ship, of the burthen of 70 ton; and in GOD, and that only ship, to put the hope of my future fortunes.

The ship resolved upon, and that in less time than eighteen months our voyage could not be effected. I next considered how our ship of seventy tons in bulk and weight might now be proportioned, in victuals, namely, and other necessities; this was all done, as contractedly as we could; and the number of men it would serve, at ordinary allowance for the forementioned time, was found to be twenty two, a small number to perform such a business, yet double sufficient to sail the ship with provident carefulness.

The baker, brewer, butcher, and others, undertake their offices upon their credits, knowing it to be a general business, and their utter undoing if they failed in performance; but truly they proved themselves masters in their arts, and have my praise for their honest care; in them consisting a great part of the performance of the voyage.

The carpenters go in hand with the ship, to make her as strong and serviceable as possible in their understandings they could.

Every thing being duly proportioned, and my small number of men known, I began to think of the quality and ability they should be of.

Voluntary loyterers I at first disclaimed, and published I would have all unmarried, approved, able and healthy seamen: In a few days an abundant number presented themselves, furnished with general sufficiency in Marine occasions. I first made choice of a *Boatswain*, and some to work with him, for fitting the rigging of the ship; and as things went forward, shipped the *subordinate Crew*. And all things being perfectly ready, I ship'd the *Master's Mates*; and last of all, the *Master* of my ship, and my *Lieutenant*. The whole company were strangers to me, and to each other, (as by way of familiarity) but yet privately recommended by worthy merchants, for their ability and faithfulness. I was sought to by divers, that had been in places of the chiefest command in this action formerly, and others also that had used the *northerly Icy-Seas*; but I utterly refused them all, and would by no means have any with me that had been in the like voyage or adventures, for some private reasons unnecessary here to be related. Keeping thus the power in my own hands, I had all the men to acknowledge immediate dependance upon my self alone, both for direction and disposing of all, as well of the navigation, as all other things whatsoever.

In the mean time, the better to strengthen my former studies in this business, I seek after *Journals*, *Plots*, *Discourses*, or whatever else might help my understanding.

I set skillful workmen to make me *Quadrants*, *Staves*, *Semicircles*, &c. as much, namely, as concern the fabrick of them, not trusting to their mechanic hands to divide them, but had them divided by an ingenious practitioner in the *Mathematics*. I likewise had *Compass-Needles*, made after the reasonablest and truest ways that could be thought on: And by the first of *April*, every thing was ready to be put together into our hopeful ship.

In the mean space I made a journey up to *London*, to know his Majesty's further pleasure, and to make known to him my readiness; who calling for the before mentioned honourable knight, I speedily after received his Majesty's royal letters, with directions for proceeding in my voyage, and my discharge; whereupon I had forth the ship into the road, expecting a fair wind to begin the voyage.

I N T O T H E

## S O U T H S E A.

**T**HE 2d of May 1631, I took my leave of the worshipful merchant-adventurers in this action, in the city of *Bristol*; and being accompanied with a reverend divine, one Mr. *Thomas Palmer*, and divers of the merchants, with others of my kindred and native countreymen, I repaired on board. Here Mr. *Palmer* made a sermon, exhorting us to continue brotherly love amongst us, and to be bold to profess the true christian religion, wherever we should happen in this our peregrination. After they had received such entertainment as my estate could afford them, they departed for *Bristol*. This afternoon I made a review of all things, as well of clothes, and other necessaries, as of victuals; and where there was found any want, we were presently furnished.

The 3d of May (after prayer for a prosperous success to our endeavours) about three a clock in the afternoon, we came to sail, and stood down the channel of *Severne*, with little wind, but slowly got forward to the westward of *Lundy*; and then the wind opposed itself so strongly against us, that we were driven to bear up and come to an anchor in *Lundy* road the 5th in the evening, where we remained until the 8th in the morning. Now hoping the wind would favour us, we came to sail, but we were forced to put into *Milford*, where we came to an anchor about midnight. Here we remained till the 17th in the morning; when with the first favouring wind, we proceeded and doubled about cape *Cleere* of *Ireland*.

The 22d we were in the latitude 51.26. and the *Blafkes* did bear of us north east, about twelve leagues off; which *Blafkes* is in latitude 52.4. Here I ordered the course that should be kept, which was generally west north west, as the wind would give leave, which in this course and distance is very variable and unconstant.

The 4th of June we made the land of *Greenland*, standing in with it to have knowledge of the trending of it; it proved very thick foul weather.

The 5th, by two a clock in the morning, we found ourselves encompassed about with ice; and endeavouring to clear ourselves of it, (by reason we could not see far about us) we were the more engaged, and struck many fearful blows against it: at length we made fast to a great piece, (it blowing a very storm) and with poles wrought day and night to keep off the ice; in which labour we broke all our poles.

The 6th, about two a clock in the morning, we were beset with many extraordinary great pieces of ice that came upon us, as it were with wilful violence; and doubtless had crushed us to pieces, if we had not let fall some sail, which the ship presently felt. In escaping that danger we ran against another great piece, that we doubted whether our ship had not been staved to pieces; but pumping, we found she made no water. The former pieces of ice had crushed our shallop all to pieces; wherefore I caused our long boat speedily to be had up from betwixt the decks, and put over-board; by help whereof we again recovered our broken shallop, and had her up

up on the decks, intending to new build her. All this day we did beat, and were beaten fearfully amongst the ice, it blowing a very storm. In the evening, we were inclosed amongst great pieces, as high as our poop; and some of the sharp blue corners of them did reach quite under us. All these great pieces (by reason it was the outside of the ice) did heave and set, and so beat us, that it was wonderful how the ship could endure one blow of it; but it was God's only preservation of us, to whom be all honour and glory. In this extremity, I made the men to let fall, and make what sail they could, and the ship forced herself thorough it, tho' so tossed and beaten, as I think never ship was. When we were clear, we fayed the pumps, and found her stanch; upon which we went instantly to prayer, and to praise God for his merciful delivery of us.

The 7th and 8th days, we endeavoured to double about cape *Farewel*, being still pestered with much ice.

The 9th. we were in latitude 59.00. and we made account the cape *Farewel* bare of us due east, and some ten leagues off. The *Blafkes* in *Ireland*, is in lat. 52. 4. and cape *Farewel* in lat. 59. 00. The course is west north west, and the distance about 410 leagues. I know very well these latitudes, courses, and distance, do not exactly agree with mathematical conclusions; but thus we found it by practice. The variation of the compass in lat. 52. 30. and thirty leagues to the westward of *Ireland*, is about 3.00. to the eastward; in lat. 57.00. about 310 leagues west north-west from the *Blafkes*, the compass doth vary 9.00. to the westward: In lat. 59. 15. some forty leagues to the eastward of cape *Farewel*, the variation is about 14. 45. In this course I have been observant, whether there were any current that did set to the N. E. as some have written there did, and that as well in calm weather, as otherwise; but I could not perceive any. The winds here are variable, and the sea of an unsearchable depth. We have not seen from *Ireland* hitherto any whales or other fish; the weather for the most part was foggy and misty, that wets as bad as rain.

The 10th, all the morning, was very foul weather, and a high-grown sea, although we had ice not far off about us, and some pieces as high as our top-mast-head. Our long boat, which we were fain to tow at stern, (by reason we were building our shallop on our decks) broke away, and put us to some trouble to recover her again. This we did, and made means to have her into the ship, though very much bruised; and that I had two men fore hurt, and like

to be lost in the heaving of her in. By eight of the clock this evening, we were shot up as high as cape *Defolation*; for finding here the land to trend away north and by east, we certainly knew it to be the cape. It stands in lat. 60. 00. and the land from cape *Farewel* to it, trends N. W. the distance about forty leagues. The distance from cape *Defolation*, to the south end of the island of *Resolution*, is about 140 leagues; the course west, half a point north. The lat. of the south end of the island, being 61. 20. some twelve leagues to the westward of cape *Defolation*, the variation is 16. 00. In this course we were much tormented, pestered and beaten with the ice, many pieces being higher than our top-mast-head. In our way we saw many grampusses amongst the ice, and it seemeth the sea is full of them: The weather for the most part a stinking fog, and the sea very black; which I conceive to be occasioned by reason of the fog.

The 17th at night we heard the rut of the shore, as we thought; but it proved to be the rut against a bank of ice that lay on the shore. It made a hollow and hideous noise, like an overfall of water, which made us to reason amongst ourselves concerning it; for we were not able to see about us, it being dark night and foggy. We stood off from it till break of day, then in again; and about four a clock in the morning we saw the land above the fog; which we knew to be the island of *Resolution*. This last night was so cold, that all our rigging and sails were frozen. We endeavoured to compass about the southern point of the island; for that we were so much pestered with the ice, and blinded with a very thick fog. Here runs a quick tide into the straight, but the ebb is as strong as the flood: The fog was of such a piercing nature, that it spoiled all our compasses, and made them flag, and so heavy withal, that they would not traverse. Wherefore I would advise any that shall sail this way hereafter, to provide compasses of *Muscovy* glass, or some other matter that will endure the moisture of the weather. As the fog cleared up, we could see the entrance of the straight to be all full of ice close thronged together. Endeavouring to go forward, we were fast inclosed amongst it; and so drove to and again with it, finding no ground at 230 fathom, four leagues from the shore.

The 20th in the morning, we had got about the southern point of the island; and the wind came up at west, and drove both us and the ice upon the shore. When we were driven within two leagues of the shore, we came amongst the most strange

whirlings of the sea that possibly can be conceived: there were divers great pieces of ice aground in 40 fathom water, and the ebb coming out of the broken grounds of the island, amongst these isles of ice, made such a distraction, that we were carried round, sometimes close by the rocks, sometimes close by those high pieces, that we were afraid they would fall upon us. We were so beaten likewise with the encountering of the ice, that we were in a most desperate estate. We made fast two great pieces of ice to our sides with our kedger and grapnels that drew nine or ten fathom, that so they might be a-ground before us, if so be we were driven on the shore. But that design failed us; and now from the top seeing in amongst the rocks, I sent the boat (for now we had finished her) to see if she could find some place of security; but she was no sooner parted, but she was inclosed, and driven to hale up on the ice, or else she had been crushed to pieces. They ran her over the ice from piece to piece; and in the mean space, with the whirling and encountering of the ice, the two pieces brake away from our sides, and carried away our kedger and grapnels: then we made signs to the boat, to make all the haste she could to us, which she perceiving did; the men being with much difficulty inforced to hale her over many pieces of ice. In the mean space we made some sail, and got to that piece of ice that had our grapnel on it, which we again recovered. By this time was our boat come, and we put a fresh crew into her, and sent her to fetch our kedger, which she endeavoured with much danger of boat and men. By this time the ship was driven so near the shore, that we could see the rocks under us and about us; and we should be carried with the whirlings of the waters, close by the points of rocks, and then round about back again; and all this notwithstanding the sail we had abroad; that we expected continually when she would be beaten to pieces. In this extremity I made them to open more sail, and to force her in amongst the rocks and broken grounds, and where there was many great pieces of ice a-ground. We went over rocks, that had but twelve or thirteen foot water on them; and so let fall an anchor. This anchor had never been able to wind up the ship, but that (by good fortune) the ship ran against a great piece of ice that was a-ground. This rush brake the main knee of her beak-head, and a corner of it tore away four of our main shrouds, and an anchor that we had at the bow, fastened into it, and so stopp'd her way, that she did wind up to her anchor. We saw the sharp rocks under us, and about

us; and had but fifteen foot water; being also in the sides way; where all the ice would drive upon us: Our boat we could not see, which made us doubt she had been crushed to pieces. In her was the third part of our company; but by and by we saw her come about a point amongst the rocks. She had recovered our kedger, which made us something joyful; with all speed we laid out hawfers to the rocks, and every one did work to the best of his strength, to warp her out of this dangerous place to the rock's side, where we had three fathom water, and were under the shelter of a great piece of ice that was a-ground, which should keep off the ice, that otherwise would have driven upon us. Here we lay very well all the ebb; but when the flood came, we were assaulted with pieces of ice, that every half hour put us into despicable distress. We did work continually and extremely, to keep off the ice. At full sea our great piece of ice (which was our buckler) was afloat; and do what we could got away from us, and left us in a most eminent danger, by reason of the ice that drove in upon us. But the ebb being once made, this great piece of ice came again a-ground very favourable to us, and sheltered us all the rest of the ebb. All night we wrought hard, to shift our cables and hawfers; and to make them fast aloft on the rocks, that the ice might the better pass under them. All day and all night it snowed hard, and blew a very storm at west, which drove in all the ice out of the sea upon us. In working against the violence of the ice, the flooke of our kedger was broken, two arms of our grapnels, and two hawfers, our shallop being again very much bruised; whereupon to work we go on all hands to repair it.

This tide the harbour was choaked full of ice, so that it did seem firm and unmoveable; but when the ebb was made, it did move. Some great pieces came a-ground, which did alter the course of the other ice, and put us on the rocks. Here, notwithstanding all our uttermost endeavours, she settled upon a sharp rock, about a yard above the main mast; and as the water ebbed away, she hung after the head, and heel'd to the offing. We made cables and hawfers aloft to her masts, and so to the rocks, straining them tough with our tackles; but she as the water ebbed away, sunk still; that at length she was so turned over, that we could not stand in her. Having now done all to the best of our understandings, (but to little purpose) we went all upon a piece of ice, and fell to prayer, beseeching God to be merciful unto us. It wanted yet an hour to low

water, and the tide did want a foot and a half to ebb, to what it had ebbed the last tide. We were careful observers of the low waters, and had marks by stones and other things which we had set up, so that we could not be deceived. The ship was so turn'd over, that the portlefs of the forecattle was in the water; and we did look every minute when she would overset. Indeed at one time the cables gave way, and she sunk down half a foot at that slip; but unexpectedly it began to flow, and sensibly we perceived the water to rise apace, and the ship withal. Then was our sorrow turned to joy, and we all fell on our knees, praising God for his mercy, in so miraculous a deliverance.

As soon as she was freed from this rock, we wrought hard to get her further off. All the flood we were pretty quiet from the ice, but when the ebb was made, the ice came all driving again upon us, which put us to a great extremity. We got as many pieces betwixt us and the rocks as we could, to fence us from the rocks. There came a great piece upon our quarter, which was above 300 of my paces about, but it came a-ground. Thus did divers great pieces besides, which was the occasion that this tide the harbour was quite choakt up; so that a man might go any way over it from side to side. When it was three quarters ebb, these great pieces that came a-ground, began to break with a most terrible thundering noise; which put us in a great fear, that those about us would break us all to pieces. But God preserved us.

The 22d in the morning, the water veer'd to a lower ebb than the last tide had done by two foot, whereby we saw God's mercies apparent in our late extremity. That flood we had some respite from our labours; but after full sea our hopes ebb too. The great piece that was by us, so stop't the channel, that the ice came all driving upon us; so that now undoubtedly we thought we should have lost our ship. To work thereupon we go with axes, bars of iron, and any thing proper for such a purpose; to break the corners of the ice, and to make way for it to drive away from us. It pleas'd God to give good success to our labours; and we made way for some, and send'd off the rest; and got so much of the softer sort of the ice betwixt us and the rocks, that we were in pretty security. But at low water, those pieces that were a-ground, breaking, kept a most thundering noise about us. This day I went ashore, and built a great beacon with stones upon the highest place of the island, and put a cross upon it, and named this har-

bour, *The harbour of God's providence*. In the evening, the harbour was fuller of the ice than ever it had been since we came hither; and the greater pieces grounded and stop't the rest, that none went out the ebb, but the ship lay as if she had lain in a bed of ice.

The 23d in the morning, with the flood, the ice drove up amongst the broken grounds; and with the ebb, drove all out (it being then very calm) except one extraordinary great piece; which coming a-ground not far from us, settled itself in such a manner, that we much fear'd him. But there came no more great ice after him; otherwise we must have expected as great danger as at any time heretofore. I took the boat, and went ashore upon the eastern side, to see if I could find any place free from danger than this unfortunate place, where amongst the rocks I desired a likely place. From the top of the hill where I was, I could see the ship. It was now almost low water; at which instant the forementioned piece of ice brake with a terrible noise into four pieces, which made me doubtful if it had not spoiled the ship, it being full half mast high. I made what haste I could to the boat, and so to the ship, to be satisfied; where I found all well, God be thanked, for that the ice had broken from the ship-ward. I instantly sent away the boat, to sound the way to a cove that I had found; which was a very dangerous passage for the boat. At her return we unmoor'd the ship, and with what speed possible warp't away from amongst this terrible ice. We were not a mile from them, but they brake all to pieces; and would surely have made us bear them company, but that God was more merciful unto us. We got about the rocks, and so into this little cove which I had so newly discovered. Here we made fast to the rocks, and thought ourselves in indifferent safety; which being done, I went ashore again, to wander up and down, to see what I could discover. I found it all broken rocky grounds, and not so much as a tree, herb, or grass upon it: Some ponds of water there were in it, which were not yet thaw'd, and therefore not ready for the fowl: We found not in the snow any footing of deer, or bears, but foxes we saw one or two.

We found where the salvages had been, but it was long since. They had made five hearths, and we found a few firebrands about them; and some heads and bones of foxes, with some whale-bones: I could not conceive to what purpose they should come thither; for we could find none or very little wood on the shore side, and no fish

at all; though we did daily endeavour to take some. But it may be the season was not yet come. I named this cove by the master's name of my ship, *Price's Cove*. The latitude of it is 61. 24. the variation. The firebrands and chips which I spake of, had been cut with some hatchet or instrument of iron. From the top of the hills, we could see the islands that are on the south shore, and commonly called *Sir Thomas Button's isles*: They did bear south and by east, half a point easterly; some 14 or 15 leagues distant upon the change day, it flows here seven a clock and a half, and the tide highest at most three fathoms. The flood comes from the eastward, and thither it returns. I have been observant from the top of the hills, whence I might defy the great pieces of ice two or three leagues from the shore, drive to and again with the flood and ebb indifferently. Hence I collected, that assuredly there is no current sets in here, but that it is a meer tide. Near the shore, the eddies whirl into twenty manners, when the ebb is made; which is, because it comes out of the broken ground amongst the ice that is aground near the shore: Besides which reason, there be divers rocks lying under water, on which you shall have now 30, then 12, and anon but 8, and then 20 fathom; and these uncertainties occasion such distractions. I would therefore advise none to come too near those dangerous shores, for fear he lose his ship, and so by consequence ail: The last night we took better rest than we had done in ten nights before.

And this morning, being the 24<sup>th</sup>, there sprung up a fare gale of wind at east; and after prayer we unfastened our ship, and came to sail, steering betwixt great pieces of ice, that were aground in 40 fathom, and twice as high as our topmast head.

We went forth of this cove, upon the flood, and had none of those whirlings of the waters, as we had at our going into it. We endeavoured to gain the north shore, and kept ourselves within a league of the shore of the island of *Resolution*, where we had some clear water to sail thorough. In the offing, it was all thick throng'd together, as might be possible. By twelve a clock we were fast inclosed, and notwithstanding it blew very hard at east, yet we could make no way through it; but the hard corners of the ice did grate us with that violence, as I verily thought it would have grated the planks from the ships sides. Thus we continued in torment till the 26<sup>th</sup> day, driving to and again in the ice, not being able to see an acre of sea from topmast head.

The 26<sup>th</sup> was calm sun-shine weather,

and we took the latitude and variation. The latitude is , the variation we founded, and had ground at 140 fathom, small white sand. I caused the men to lay out some fishing lines, but to no purpose; for I could not perceive that the bait had been so much as touched. The nights are very cold, so that our rigging freezes, and the fresh ponds of water stand upon the ice above half an inch thick.

The 27<sup>th</sup>, there sprung up a little gale at south-east, and the ice did something open. Hereupon we let fall our foreail, and forced the ship thorough the throng of ice. In the evening, the wind came contrary, at W. N. W. and blew hard, which caused us to fasten to a great piece, to which we remained moor'd till the 29<sup>th</sup>.

The 29<sup>th</sup> I resolved, that here is no current, and that by many experiments which I have made: namely, by taking marks on the land, and noting our drift to and again with the ebb and flood for many days together, as well in calm weather as otherwise. By all these experiments, I found exactly, that the tide was no stronger there than that betwixt *England* and *France*.

The 29<sup>th</sup> in the morning, there sprung up a fine gale at east, and the ice did open something, so that we did force the ship thorough it with her foreail. By twelve a clock, we were gotten into some open water, with a fine gale of wind at east, and so clear weather, that we could see the island of *Resolution*. The north-end did bear of us E. N. E. some twelve leagues off.

From the 29<sup>th</sup>, till the 5<sup>th</sup> of *July*, we sailed continually thorough the ice, with variable winds and fogs, and sometimes calm. At noon we had a good observation, and were in latitude 63. 15. and then we saw *Salisbury* island, bearing W. by N. some seven leagues off, with much ice betwixt it and us; to weather which we were driven to stand to the northward. Soon after we saw *Prince Charles's* cape and *Mill* island; and to the N. N. W. (and indeed, round about us) the sea most infinitely pestered with ice. This did grieve me very much; for whereas I had determined to prosecute the discovery to the north-westward, I saw it was not possible this year. We were moreover driven back again with contrary winds, still closed and pestered with ice, and with all the perils and dangers incident to such adventures, so that we thought a thousand times that the ship had been beaten to pieces.

By the 15<sup>th</sup> of *July* we were got betwixt *Digge's* island and *Nottingham's* island, not being able to get more northward. There for an hour or two we had some open water.

But

But before I proceed farther, it were not amiss in some manner to describe the freight, which begins at the island of *Resolution*, and ends here at *Digger's* island. If you go down into the bay, the freight is about 120 leagues long; and trends W. N. W. and E. S. E. generally. In the entrance it is about 15 leagues broad; and then on the southward side is a great bay. About the midst it is likewise about 15 leagues broad, and then the land opens something wider; so that betwixt *Digger's* island and cape *Charles*, it is about 20 leagues broad: Betwixt which two stands *Salisbury* island and *Nottingham* island. If it be clear weather, you may see both the south and the north shores; ordinarily, the depth in the middle of the freight is 120 fathoms, white sand: A certain tide runs in it, and no current: The north shore is the straightest, and the clearest from ice too. Along the north shore you have many low small islands, which cannot be seen far off from the land; and in many places, the land makes as if it had small sounds in it. The main land on both sides is indifferent high land. And so much for discourse may suffice, referring you to the plot for the particulars.

The 16th, being now resolved of the impossibility to do any thing to the north westward, for the reasons aforesaid, I gave order to the master of my ship to steer away, W. S. W. to have a sight of *Mansfield's* island, which the next day by three a clock in the afternoon we had; having had so much dangerous foul weather amongst the ice, that we struck more fearful blows against it than we had ever yet done. This was the first day that we went to half allowance of bread flesh days, and I ordered things as sparingly as I could. Two of our men complained likewise of sickness, but soon afterward recovered. In the evening we came to an anchor, and I sent the boat ashore to try the tides. They brought me word, that whilst the boat was ashore, it flowed about some three foot; and as we found by the ship, and by the ice, the water at that time came from the W. S. W. and that at the highest tides (so far as they could perceive) it had not highed above two fathom: They found that the savages had been upon it, by certain fires which they found, and heaps of stones, tracks of other beasts, but foxes they could not find. The wind was so contrary, and the weather so foggy, that we were fain to spend some powder to recover our boat again.

Next morning, being the 17th, the wind came something favourable, and we weighed. The shore being something clear of ice, (though very thick all to the offing) we stood along it S. and S. by W. some

VOL. II.

ten leagues. In the afternoon, the wind came contrary, and we came again to an anchor, within a mile of the shore; for to sea-board was all thick ice and unpassable. I went ashore myself, to be resolved of the tide, and found whilst I was ashore, that it did flow two foot; and at that time the flood came from the S. W. by W. I doubted it was an half tide, which afterwards I found to be true. I found where the savages had been upon the island, but could see little or no drift wood on the shore, no beasts on the island, nor fishes in the sea. It flows on the change day about a eleven a clock. We saw some fowl on it, of which we killed one, and returned on board. This island is very low land, little higher than a dry sand-bank. It hath ponds upon it of fresh water, but no grafs; and is utterly barren of all goodnes.

The 18th in the morning, the wind came something favourable, and we weighed and came to sail; for the ice was all come about us. We endeavoured to proceed to the westward, intending to fall with the western land about the latitude 63. 00. By twelve a clock (having been much pestered) we were come to a firm range of ice; but it pleased God that the wind larged, and we stowed away S. S. W. at noon in latitude 62. 00. By four in the evening (having escaped dangerous blows) we were come as we thought into an open sea, and joyfully steered away W. and W. by N. although that joy was soon quailed. By ten at night we heard the rut of the ice, and it grew a thick fog, and very dark with it: nevertheless we proceeded, and the nearer we came to it, the more hideous noise it made.

The 19th, by three in the morning, we were come to it, and as it did clear a little, we could see the ice; which were as thick rands of ice, as any we had yet seen. These being unpassable, and moreover the wind at N. W. we stowed along it, hoping to weather it to the southward; but at last, we became so blinded with fog, and so incompassed with ice, that we could go no farther.

The 20th in the morning (notwithstanding the fog) we endeavoured to get to the westward, our ship beating and knocking all this while most fearfully.

It this wilfulness we continued till the 21st. when being fast amongst the ice, I observed we were in latitude 60. 33. and then looking what damage our ship might have received, we could perceive that below the plate of iron, which was before her cut-water, she was all bruised and broken; the two knees she had before to strengthen her, spoiled and torn; and many other defects, which we could not by any means

5 T

came

come to mend. Notwithstanding all this, and the extraordinary thick fog, (that we could not see a pistol shot about us) we proceeded with the hazard of all.

Till the 27th, which was the first time we had clear weather to look about us: The wind withal came up at south, and the ice did open something; so that we made some way thorough it to the westward. In the evening we were fast again, and could go no farther; the wind veering from the south to the east, and blowing a fresh gale. This occasioned our griefs the more, that with a good wind we could not go forward; putting therefore a hawser upon a piece of great ice, to keep the ship close to it, we patiently expected for better fortune. Since we came from *Mansfield's* island, our depth was commonly 110 and 100 fathom oozy ground. Now the water begins to shoal; for this present 27th, driving fast to and again in the ice, we have but 80 fathom ground as before.

The 28th and 29th, we were so fast inclosed in the ice, that notwithstanding we put abroad all the sail that was at our yards, and that it blew a very hard gale of wind, the ship stirred no more than if she had been in a dry dock. Hereupon we went all boldly out upon the ice, to sport and recreate ourselves, letting her stand still, under all her sails. It was flat, extraordinary large ice, the worst to deal withal that we had yet found. I measured some pieces, which I found to be 1000 of my paces long. This was the first day that our men began to murmur, thinking it impossible to get either forwards or backwards. Some were of the opinion, that it was all such ice betwixt us and the shore. Others, that the bay was all covered over; and that it was a doubt whether we could get any way, or to any land to winter in. The nights were long, and every night it did freeze, that we could not sail amongst the ice by night, nor in thick foggy weather. I comforted and encouraged them the best I could; and to put away these cogitations, we drank a health to his majesty on the ice; not one man in the ship, and the still under all her sails. I most ingeniously confess, that all their murmuring was not without reason: Wherefore doubting that we should be frozen up in the sea, I ordered that fire should be made but once a day; and that with a certain number of shides, that the steward should deliver to the cook by tail, the better to prolong our fuel, whatsoever should happen.

The 30th we made some way thro' the ice; we heaving the ship with our shouldered, and with mawls and croes of iron breaking the corners of the ice, to make

way. As we got forwards, the water shoal'd apace; so that I believe it to be some island. At noon we observed thro' the fog, with the quadrant, upon a piece of ice, and were in latitude 58. 54. our depth 30 fathom. We put out hooks, to try to catch some fish, but to no purpose, for there is not any in this bay.

The 31st we laboured as afore said, and got something forward. At noon we were in lat. 58. 40. our depth 23 fathom. It was very thick hazy weather, or else I think we should have seen the land.

The first of *August* the wind came up at west, which drove us to the eastward, where our depth increased to 35 fathom. At noon (by observation with the quadrant, on the ice) we were in latitude 58. 45. At six a'clock this evening we might perceive the ice to heave and set a little; which was occasioned by a swelling sea that came out of the south-west. This did comfort us very much, hoping shortly we should get out of the ice.

The 2d it did blow hard at S. W. and yet we could not feel the forementioned swelling sea; which did again quench the hopes we had formerly conceived.

The 3d we did see a little open water to the Northwestward, and did feel a swelling sea from the west; which doth assure us, that there is an open sea to the westward.

The 5th we saw the sea clear; but could by no means work ourselves to it with our sails; wherefore about six in the evening we let fall an anchor in 50 fathom water, and stood all with poles and oars to fend off the ice, and let it pass to leeward. We continued this labour all night.

The 6th in the morning the wind came up at N. W. and we weighed with much joy, as hoping now to get into an open sea to the southward. This by noon we had done, and were in lat. 58. 28. very free of ice. The wind did large upon us, so that we stood away N. W. to get up as high to the northward as we could, and so to come coasting to the southward. We went to prayer, and to give God thanks for our delivery out of the ice.

The 9th (being in lat. 59. 40.) we came again to the ice, which lay very thick to the north. Since we came out of the ice, our depth increased to 110 fathom, and now decreaseth again: So that I think we approached towards the shore.

The tenth proved very thick foggy weather; the wind contrary, and the water shoaling apace, we came to an anchor in 22 fathom.

The 11th in the morning we weighed, and made in for the shore, and about noon saw the land, our depth being 16 fathom,

in lat. 59. 40. The land to the N. of us did trend N. by E. and so made a point to the southward, and trended away W. by S. which we followed, making it for that place which was formerly called *Hubbert's* hope. And so it proved indeed, but it is now hopeless.

Two or three weeks now concerning the bay that we have passed over. It is from *Diggs* island to the western land (in latitude afore said) about 160 leagues, the course W. S. W. the variation.

The tides do set in the middle of the bay, east and west, as we have often try'd by our lead a ground. But nearer the shores, as they are forced by the land, I am of the opinion, that in the ocean, or in large bays, the tides do naturally set E. and W. and that this doth give little hope of a passage. The greatest depth we had in the bay was 110 fathom, and so shoaling as you approach to land, we coasted round about this forementioned little bay, which is some 18 leagues deep in 8 and 6 fathoms, and in the bottom of it we were in 2 fathom and a half water, and saw the firm land almost round about us. Then we proceeded to the southward six and seven fathom water, within sight of the breach of the shore, keeping the lead continually going, and in the night we would come to an anchor. This night, here being little wind, we came to an anchor with our kedger; but in weighing of him, we lost him, having no more aboard us.

The twelfth we were in lat. 58. 46. some two leagues from the shore, The variation is about 17 deg.

The 13th in the afternoon (it being something hazy) we saw some breaches a-head us; our depth was 9 and 10 fathom; and luffing to clear ourselves of them, we suddenly struck upon the rocks; the ship then being under our two topsails, fore sail, and sprit-sail, with a fresh gale of wind. In this fearful accident, we struck all our sails a-main; and it did please God to fend two or three good swelling seas, which did heave us over the rocks into three fathom, and presently into three fathom and a half, where we chopt to an anchor, and assayed the pumps; but we found she made no water, although she had three such terrible blows, that we thought her malt would have shiver'd to pieces, and that she had been assuredly bulged. We hoisted the boat over-board, and doubly mann'd her, to go seek and found a way out of this perilous place. She was no sooner gone, but there rose a fog; so that we were fain to spend some powder, that she might hear whereabouts we were. The wind dull'd something, otherwise it had been doubtful whether she

could ever have recovered to us again. After she had been absent about two hours, she brought us word, that it was all rocks and breaches round about us, and that withal, she had found a way, where there was not less than two fathom and a half, and that afterwards the water did deepen. We did presently weigh, and follow the boat, and past over two ledges of rocks, on which there was scarce fourteen foot water: Then it did deepen to three, four, and so to fourteen fathom; then it shoal'd again to nine. It being now night, we came to an anchor; where we rid in different well all the night. In the morning the wind came contrary, so that we could not go that way we intended to clear our selves, and therefore we went to work, to fit our holds, to splice our cables, and make ready two shot, and so placed them in the hold, that they might upon all occasions run clear; the ends of them being fasten'd to the main-mast. We likewise look'd to our anchors, and fitted our spare ones. We got out our long boat from betwixt the decks; which was very much broken and bruised. The carpenter went to work to fit her, (for I intended to tow the shallop at stern) and so to have the boats ready at an instant, either to lay out anchors, or be serviceable to what God should be pleased to try our faith and patience withal; for in him was our only trust, and our hope upon his favour in our honest endeavours. At noon, in lat. 57. 45. we could see the land from the N. W. to S. E. by E. with rocks and breaches; and the rocks that we came over, dry above water; whereby I knew it flows here two fathoms at least. At noon I sent the boat off to sound to the eastward, because the water shoal'd when we came to an anchor. She brought us word, the shoalest water she had been in was seven fathom. We intending thereupon to weigh, the wind came easterly, so that we could not budge; but lay here the 14th all night with a stiff gale of wind.

The 15th in the evening our cable galded off; by reason of which perilous and sudden accident, in which we had not time to put a buoy to it, we lost our anchor, and were driven into four fathom water, before we could set our sails. This when we had done, we stowed S. S. E. the wind being at east, but the water shoal'd to three fathom. Then we stowed N. N. E. and it did deepen by degrees to ten fathom; and because it grew dark, we came to an anchor, and rid a good stress all night.

The 16th in the morning the wind came up at N. a fresh gale; and we weighed and came to sail. By nine a clock it grew to

be a very storm; and we turned to and again in ten fathom water. In the evening the wind dull'd; and we stood S. W. to have a sight of port *Nelson*; which course we stood all night, by the stars, being in lat. 57. 25. the variation about 17 degrees.

The 17th in the morning we stood south; and our depth decreased by degrees to eight fathoms. At noon we had good observation, being in lat. 57. 15. and we make account that we are some six or seven leagues off the southern side of port *Nelson*. Here the colour of the water changed, and was of a puddleish and sandy red colour. We stood into six fathoms, and could not see the land from top-mast-head? so night coming on, and it beginning to blow hard at east by south, we stood off again into ten and twelve fathoms, where the water was again of the colour of the sea.

The 18th, as the wind and weather favoured us, and the storm was broken up, we stood in again south, and came again into thick puddleish water, into eight, seven, and six fathom, and then off again, for that it grew thick foggy weather, keeping our lead continually going, night and day.

The 19th, being fine clear sun-shine weather, we stood in again into the thick puddleish water, into eight fathom, where we came to an anchor to try the tides; for that from top-mast-head we could not now see the land. We were at noon (by good observation) in lat. 57. 20. and the tide did set N. W. by W. and S. E. by E. It did run two knots and a half in two glasses. I resolved that this was nothing but shoals to the land. In the afternoon it began to snuffle and blow, so that we had much ado to get up our anchor. This being done, we stood E. S. E. but the water shoaled apace. Then we stood E. and it deepened a little. In the evening the wind came up at W. and then we stood E. S. E. into ten and eight, and afterwards S. E. as our depth did guide us by our lead and the colour of the water, into seven and six fathoms.

The 20th at six in the morning we saw the land, it being a very low flat land. We stood into five fathoms, to make it the better, and so stood along it. At noon we were in lat. 57. 00. We named it *the new principality of South Wales*, and drank a health in the best liquor we had to prince *Charles* his highness, whom God preserve. We stood along it, and came to a point where it trends to the southward; near to which point there are two small islands. In the evening it was calm, and we came to an anchor. The tide set as aforesaid. There we rid all that night, and the next day, by reason the wind was contrary. There went a chopping short

sea; and the ship did labour at it exceedingly leaping in spreetail-yard, fore-castle, and all; for as yet we had not trimm'd her well, to ride. About nine at night it was very dark, and it did blow hard. We did perceive by the lead the ship did drive; wherefore bringing the cable to capstan, to heave in our cable (for we did think we had lost our anchor) the anchor hitch'd again, and upon the chopping of a sea, threw the men from the capstan. A small rope in the dark had gotten foul about the cable, and about the master's leg too; but with the help of God he did clear himself, tho' not without fore bruising. The two mates were hurt; the one in the head, the other in the arm. One of our lustiest men was stricken on the breast with a bar, that he lay sprawling for life; another had his head betwixt the cable, and hardly escaped. The rest were flung where they were fore bruised; but our gunner (an honest and a diligent man) had his leg taken betwixt the cable and the capstan, which wrung off his foot, and tore all the flesh off his leg, crush'd the bone to pieces, and sorely withal bruised all his whole body; in which miserable manner he remained crying till we had recovered ourselves, our memory, and strengths to clear him. Whilst we were putting him and the rest down to the chirurgeon; the ship drove into shoally water, which put us all fear; we being to forely weaken'd by this blow, which had hurt eight of our men. It pleased God, that the anchor held again; and she rid it out all night. By midnight the chirurgeon had taken off the gunner's leg at the gartering place, and dress'd the others that were hurt and bruised; after which we comforted each other as well as we could.

The 22d we weighed, and stood a little off into deeper water, expecting a better wind; which in the afternoon favoured us. We stood in again for the shore, and along it we proceeded. It is very shoal about four leagues off, and full of breaches.

The 23d at noon we were in lat. 56. 28. In the evening, the wind came contrary, and we were fain to turn to and again. All this month the wind hath been very variable, and continued not long upon one point; yet it happened so, that we could get but little forward.

The 26th there sprung up a fine gale at west, but very thick weather; nevertheless we stood into seven and six fathom, the water very thick and puddleish. At noon it cleared; and we could see that we were imbayed in a little bay: the land being almost round about us.

We stood out of it, and so along it, in sight, till the 27th in the morning; when

we came to higher land than any we had yet seen since we came from *Nottingham* island. We stood into it, and came to an anchor in five fathom. I sent off the boat, well mann'd and arm'd, with order in writing what they were to do, and a charge to return again before sun-set. The evening came, and no news of our boat; we shot and made false fires, but had no answer, which did much perplex us, doubting that there had been some disaster befall her, thro' carelessness, and in her we should lose all. We aboard, at present, were not able to weigh our anchor, nor fail the ship. At last we saw a fire upon the shore, which made us the more doubtful, because they did not answer our shot, nor false fires with the like. We thought withal, that it had been the salvages, who did now triumph in their conquest. At length they came, all safe and well; and excused themselves, in that upon their coming ashore, it did ebb so suddenly, that a bank of sand was so presently dry without them, as they could not come away, till that was covered again; and with that they pacified me. They reported, that there was great store of drift-wood on the shore; and a good quantity growing on the land. That they saw the tracks of deer and bears, good store of fowl (of which they had killed some) but no sign of people: That they pass'd over two little rivers, and came to a third, which they could not pass: That it did flow very near three fathoms sometimes, as appeared by the shore. That it was low water at four a clock; that the flood came from the N. W. and that it flow'd half tide, which both they and we had perceived by the ship. At low water we had but three fathom, where we did ride. The wind began to blow hard at E. whereupon we weighed and stood to the northward till midnight, then in again; and in the morning we saw the land, and then it began to blow hard, and as we stood off, it increased to a very storm; so that at length we could not maintain a pair of courses, but tried under our main course, all day and all night; some time turning her head to the landward, some time to the offing.

The 29th in the morning we made account we had droven back again some 16 or 18 leagues; and in the morning (as it cleared) we saw a ship to leeward of us some three or four leagues; so we made sail, and bore up with her. She was then at an anchor in 13 fathom. It was his majesty's ship, and captain *Fox* commanded in her.

I saluted him according to the manner of the sea, and received the like of him. So I stood in to see the land, and thought to tack about, and keep weather of him, and

to send my boat on board of him; but the wind shifted, so that for that time I could not. In the evening, I came to weather of him, and sent my boat on board of him, who presently weighed, and stood off with me till midnight, and then we stood in again.

In the morning, captain *Fox* and his friends came on board me; where I entertained them in the best manner I could, and with such fresh meat as I had gotten from the shore: I told him, how I had named the land, *The south principality of Wales*. I shewed him how far I had been to the eastward, where I had landed; and in brief, I made known to him all the dangers of this coast, as far as I had been. He told me, how he himself had been in port *Nelson*, and had made but a cursory discovery hitherto; and that he had not been aboard, nor had not many times seen the land. In the evening, after I had given his men some necessaries, with tobacco and other things which they wanted, he departed on board his ship; and the next morning stood away S. S. W. since which time I never saw him. The wind something favouring me, I stood in for the shore, and so proceeded along it in sight.

This month of *August* ended with snow and hail; the weather being as cold as at any time I have felt in *England*.

The first of *September* we coasted along the shore in ten fathoms, and when it cleared, in sight of land. At length the water shoaled to six and five fathom, and as it cleared, we saw it all breaches to leeward, so we hull'd off, N. N. E. but still raised land. By night we had much ado to get safely out of this dangerous bay. At midnight the wind came up at S. and so we took in our sails, and let the ship drive to the northward into deeper water. This day was the first time the surgeon told me, that there were divers of the men tainted with sickness. At noon we were in lat. 55.12.

The second we stood in again for the shore, but as we came into shoal water it began to blow, the weather being wintery and foul, threatening a storm; wherein we were not deceived, for that in standing off we had a violent one.

By midnight it broke up, and the third in the morning we stood in again, and by eleven we saw it. Here we found the land to trend S. S. E. and S. so that we knew we were at a cape land; and named it *cape Henrietta Maria*, by her majesty's name, who had before named our ship. At noon we were in lat. 55.05. and that is the height of the cape.

From port *Nelson* to this cape, the land trends (generally) E. S. E. but makes with points and bays; which in the particulars

doth alter it a point, two or three. The distance is about 130 leagues, the variation at this cape taken by amplitude, is about 16 deg. a most shoal and perilous coast, in which there is not one harbour to be found.

The 3d day in the afternoon, we had a tearing storm at N. which continued till midnight in extreme violence.

The 4th in the morning (the storm being broke up) we stood in again S. W. The weather was very thick, and we found continually; but by noon it cleared, and we saw the land. Here it did trend S. by E. and the tides did set along it, with a quick motion. In the evening there came a great rolling sea out of the N. N. E. and by eight a clock it blew very hard at S. E. and by reason of the encounter of the wind and this great sea, the sea was all in a breach; and to make up a perfect tempest, it did so lighten, snow, rain and blow all the night long, that I was never in the like: We shipped many seas, but one most dangerous, which rack'd us fore and aft, that I verily thought it had sunk the ship, it strook her with such a violence. The ship did labour most terribly in this distraction of wind and waves, and we had much ado to keep all things fast in the hold and betwixt decks.

The 5th in the morning, the wind shifted to S. W. but changed not his condition, but continued in his old anger and fury. In the afternoon it shifted again to the N. W. and there showed his uttermost malice; and in that tearing violence, that nor I, nor any that were then with me, ever saw the sea in such a breach. Our ship was so tormented and did so labour, with taking it in on both sides, and at both ends, that we were in a most miserable distress in this so unknown a place. At eight a clock in the evening the storm brake up, and we had some quietness in the night following, not one having slept one wink in 30 hours before. If this storm had continued easterly, as it was at first, without God's goodness we had all perished.

The 6th, the wind was at S. W. so that we could do no good to the westward. We spent the time therefore in trimming of our ship; we brought all our coals (which for the most part was great coal) aft; as we also did some other things, and all to lighten her afore. Others did pick our bread, whereof there was much wet; for do what we could, we ship'd abundance of water betwixt decks, which ran into the hold, and into our bread-room; for the sea indeed, so continually over-rack'd us, that we were like *Jonas* in the whales belly. We over-looked our tacks and shoots, with other riggings of strefs, be-

cause that hence forward we were to look for no other but winter weather. This evening our boatwain (a painful man, and one that had labour'd extremely these two or three days) was very sick, swooning away three or four times; inasmuch that we thought verily he would presently have died.

The 7th in the morning the wind came up at S. E. and we stood away S. W. under all the sail we could make. In this course we saw an island, and came close aboard it, and had 20 fathom water, which was some comfort to us; for hitherto we could not come within four or five leagues of the shore, at that depth. This island stands in latitude 54. 10. In the afternoon we stood away S. W. and in the evening had the shoaling of the western shore, in ten, eight and seven fathom, but it was so thick, that we could not see the land. It is about 14 leagues betwixt this island and the main.

The 8th was thick, foggy and calm; which so continued till the 9th, about six in the morning; the wind then coming up at S. S. W. (though very foggy) we stood to the eastward, keeping our lead going continually. In the evening the water shoaled to ten and nine fathom, wherefore we stood off and on all night.

The 10th we made it, finding it an island of about eight or nine leagues long. It stands in latitude 53. 5. and about 15 leagues from the western shore. The part of it that we coasted, trends W. N. W. I named it my lord *Weston's Island*. We stood still away to the eastward, it being broken foggy weather. In the afternoon, we descri'd land to the eastward of us, which made like three hills or hummocks: Towards them we sail, keeping our lead still going, and very circumspect. At length we also saw land to the southward of us; whereupon we loof up, and now make for that, by course, as we had set it in the thick dark fog. We came in amongst such low broken grounds, breaches and rocks, that we knew not which way to turn us; but God be thanked it was but little wind, and so we came to an anchor. Soon after it cleared, at which time we could see nothing but sands, rocks and breaches round about us; that way only excepted which we came in. I sent presently the boat to sound amongst the shoals and rocks, that if we should be put to extremity, we might have some knowledge which way to go. This night proved calm and fair weather, and we rid quietly.

The 11th in the morning, I went in the boat ashore my self; and whilst I was a land, I sent the boat about amongst the broken

broken grounds to sound. I found this island utterly barren of all goodness, yea, of that which I thought easily to have found; which was scurvy-grass, sorrel, or some herb or other, to have refreshed our sick people. I could not perceive that the tide did flow here (ordinarily) above two foot. There was much drift wood on the shore, and some of it drove up very high, on the north-side of the island; whereby I judged that the storms were very great at north in the winter. Thus I returned aboard; and sent many of our sick men to another part of island, to see if they themselves could fortunately find any relief for their griefs. At noon, by good observation, we were in latitude 52. 45. In the evening our men returned comfortless; and then we weigh'd and stood to the westward, coming to an anchor under another island, in 20 fathoms.

The 12th in the morning it began to blow hard at S. E. which was partly off the shore, and the ship began to drive, it being soft oozy ground. We heaved in our anchor thereupon, and came to sail under two courses. Whilst the most were busy in heaving out of top-sails; some that should have had special care of the ship, ran her ashore upon the rocks, out of meer carelessness; in looking out and about, or heaving of the lead after they had seen the land all night long, and might even then have seen it, if they had not been blinded with self-conceit, and been enviously opposite in opinions. The first blow struck me out of a deep sleep; and I running out of my cabin, thought no other at first, but I had been awakened (when I saw our danger) to provide my self for another world.

After I had controul'd a little passion in my self, and had checkt some bad counsel that was given me, to revenge my self upon those that had committed this error; I ordered what should be done to get off these rocks and stones: First, we halled all our sails a back-stays, but that did no good, but make her beat the harder: Whereupon we struck all our sails amain; and furl'd them up close, tearing down our stern to bring the cable through the cabin to the capitan, and so laid out an anchor to heave her astern. I made all the water in hold to be staid, and set some to the pumps to pump it out, and did intend to do the like with our beer: Others I put to throw out all our coals, which was soon and readily done. We quitted out our cables into our long boat; all this while the ship beating so fearfully that we saw some of the sheathing

swim by us. Then stood we, as many as we could, to the capitan; and heaved with such a good will, that the cable brake, and we lost our anchor. Out with all speed therefore, we put another. We could not now perceive whether she did leak or no; and that by reason we were employed in pumping out the water, which we had bulged in hold; though we much doubted, that she had received her death's wound; wherefore we put into the boat the carpenter's tools, a barrel of bread, a barrel of powder, six muskets, with some match, and a tinder-box, fish-hooks and lines, pitch and okum; and to be brief, whatever could be thought on in such an extremity. All this we sent ashore, to prolong a miserable life for a few days. We were five hours thus beating, in which time she struck 100 blows, inasmuch that we thought every stroke had been the last that it was possible she could have endured. The water we could not perceive in all this time to flow any thing at all: At length it pleased God, she beat over all the rocks, though yet we knew not whether she were stanch. Whereupon to pumping we go on all hands, 'till we made the pumps suck; and then we saw how much water she did make in a glass. We found her to be very leaky; but we went to prayer and gave God thanks it was no worse; and so fitted all things again, and got farther off and came to an anchor. In the evening it began to blow very hard at W. S. W. which if it had done whilst we were on the rocks, we had lost our ship without any redemption. With much ado we weigh'd our anchor, and let her drive to the eastward amongst the broken grounds and rocks, the boat going before, founding. At length we came amongst breaches, and the boat made signs to us that there was no going farther. Amongst the rocks therefore we again came to an anchor, where we did ride all night, and where our men, which were tired out with extreme labour, were indifferently well relieved. Here I first noted, that when the wind was at S. it flowed very little or no water at all, so that we could not bring our ship aground to look to her, for we did pump almost continually.

The 13th at noon we weigh'd and stood to the westward; but in that course it was all broken grounds, shoals and sunken rocks, so that we wondered with our selves, how we came in amongst them in a thick fog. Then we shaped our course to the northward, and after some consultation with my associates, I resolv'd to get about this land, and so to go down into the bottom of *Hudson's Bay*, and see if I could

could discover a way into the river of *Canada*; and if I failed of that, then to winter on the main land, where there is more comfort to be expected, than among rocks or islands. We stood along the shore, in sight of many beaches: When it was night we stood under our fore-sail, the lead still going. At last the water shoaled upon us to ten fathom, and it began to blow hard: We tackt about, and it did deepen to 12 and 14 fathom, but by and by it shoaled again to eight fathom. Then we tackt about again, and suddenly it shoaled to six and five fathom, so we struck our sail again, and chopt to an anchor, resolving to ride it out for life and death. We rid all night a great stress, so that our bits did risk, and we thought they would have been torn to pieces.

At break of day the 14th, we were joyful men; and when we could look about, we descried an island some two leagues off, at W. by N. and this was the shoal that lay about it. Here did run a distracted, but yet a very quick tide, of which we taking the opportunity, got up our anchor, and stood N. W. to clear our selves of this shoal. In the afternoon the wind came up at N. E. and we stood along the eastern shore in sight of a multitude of breaches. In the evening it began to blow a storm not fail-worthy, and the sea went very high, and was all in a breach. Our shalop, which we did now tow at stern, being moor'd with two hawfers was sunk, and did spin by her moorings, with her keel up, twenty times in an hour. This made our ship to hull very broad, so that the sea did continually over-rake us, yet we endured it and thought to recover her. All night the storm continued with violence, and with some rain in the mornings, it then being very thick weather. The water shoaled apace, with such an over-grown sea withal, that her sail was not to be endured, and what was as ill, there was no trusting to an anchor. Now therefore began we to prepare ourselves, how to make a good end of a miserable tormented life. About noon as it cleared up, we saw two islands under our lee; whereupon we bare up to them, and seeing an opening betwixt them, we endeavoured to get into it before night, for that there was no hope of us, if we continued out at sea that night; therefore come life, come death, we must run this hazard. We found it to be a good found, where we rid all night safely, and recovered our strengths again, which were much impaired with continual labour. But before we could get into this good place, our shalop broke away, (being moor'd with two hawfers) and we lost her to our great grief. Thus now

had we but the ship-boat, and she was all torn and bruised too. This island was the same that we had formerly coasted the western side of, and had named my lord *Wilton's* island. Here we remained till the 19th, in which time it did nothing but snow and blow extremely, insomuch that we durst not put our boat over-board.

The 19th, the wind shifted N. N. E. and we weigh'd and stood to the southward; but by noon the wind came up at S. and so we came to an anchor under another island, on which I went ashore, and named it *The earl of Bristol's island*. The carpenter wrought hard in repairing our boat; whilst I wandered up and down on this desert island, I could not perceive that ever there had been any salvages on it; and in brief, we could find neither fish, fowl nor herb upon it, so that I returned comfortless on board again. The tides do high about some six foot, now that the wind is northerly: The flood comes from the north, and it doth flow half-tide. The full sea this day was at one a clock. Here seeing the winds continue so northerly, that we could not about to go into *Hudson's* bay, we considered again what was best to do, to look out for a wintering-place. Some advised me to go for port *Nelson*, because we were certain that there was a cove, where we might bring in our ship. I liked not that counsel, for that it is a most perilous place, and that it might be so long ere we could get thither, that we might be debar'd by the ice. Moreover, seeing it was so cold here, as that every night our rigging did freeze, and that sometimes in the morning we did shovel away the snow half a foot thick off our decks, and in that latitude too; I thought it far worse in the other place. I resolved thereupon to stand again to the southward, there to look for some little creek or cove for our ship.

The 21st, the wind came up at N. and we weigh'd, although it was a very thick fog, and stood away S. W. to clear our selves of the shoals that were on the point of this island. This island is in lat. 53. 10. When we were clear, we steer'd away S. At noon the fog turned into rain, but very thick weather, and it did thunder all the afternoon, which made us doubt a storm; for all which we adventured to proceed. In the evening the wind increased, and blew hard; wherefore we took in all our sails, and let her drive to the southward, heaving the lead every glass. Our depth, when we took in our sails, was thirty fathom, and it did increase to 45, which was a great comfort to us in the dark: At midnight, our depth began suddenly to decrease; and as fast as the lead could be

heaved, it shoaled to twenty fathom, wherefore we chopt to an anchor, and trimmed our ship afire, to mount on the sea, and fitted all things to ride it out. There was no need to bid our men watch, not one of them putting his eyes together all the night long. We rid it out well all the night, although the sea went very lofty, and that it did blow very hard.

The 22d in the morning, when we could look about us, we saw an island under our lee some leagues off, all being shoals and breaches betwixt us and it. At noon (with the help of the windward tide) we attempted to heave up our anchor, although the sea still went very lofty. Joining all our strengths therefore, with our best skills, God be thanked, we had it up; but before we could set our sails we were driven into nine fathom. Endeavouring thereupon to double a point, to get under the lee of this island, the water shoaled to seven, six, and five fathom, but when we were about, it did deepen again, and we came to an anchor in a very good place; and it was very good for us that we did, for the wind increased to a very storm. Here we rid well all the night, took good rest, and recovered our spent strengths again. The last night and this morning it did snow and hail, and was very cold: Nevertheless, I took the boat and went ashore, to look for some creek or cove to have in our ship, for she was very leaky, and the company become sickly and weak, with much pumping and extreme labour. This island, when we came to the shore, was a thing but ledges of rocks, and banks of sand, and there went a very great surf on them. Nevertheless I made them row thorough it, and ashore I got with two more, and made them row off without the breaches, and there to come to an anchor and to stay for me: I made what speed I could to the top of a hill, to discover about, but could not see what we looked for: Thus because it began to blow hard, I made haste towards the boat again. I found that it had ebbed so low, that the boat could not by any means come near the shore for me; so that we were fain to wade thro' the surf and breaches to her; in which some took such a cold, that they did complain of it to their dying day. But now it began to blow hard, so that we could not get but little to windward toward our ship, for the wind was shifted since we went ashore; and return to the shore we could not, by reason of the surf. Well, we row for life; they in the ship let out a buoy by a long warp, and by God's assistance we got to it, and so haled up to the ship, where we were well welcomed, and we all rejoiced together.

VOL. II.

This was a premonition to us, to be careful how we sent off the boat, for that it was winter weather already. I named this island, *Sir Thomas Roe's island*: It is full of small wood, but in other benefits not very rich, and stands in lat. 52. 10. At noon we weighed, seeing an island that bare S. S. E. of us, some four leagues off, which was the highest land we had yet seen in this bay; but as we came near it, it suddenly shoaled to six, five, and four fathom, wherefore we struck our sails amain, and chopt to an anchor; but it was very foul ground, and when the ship was winded up, we had but three fathom at her stern. As it cleared, we could see the breaches all along under our lee; holding it safe therefore to stay long here, we staid every thing in order, for the ship to fall the right way. We had up our anchor, got into deep water, and stood over again for *Sir Thomas Roe's island*, which by night we brought in the wind of us, some two leagues off, which did well shelter us. The tides run very quick here amongst these shoals; and their times of running ebb or flood, be very uncertain: Their currents are likewise so distracted, that in the night there is no failing by the compass; wherefore we were fain to seek every night some new place of security to come to an anchor.

The 24th in the morning it did lower, and threaten a storm, which made us with the windward tide weigh to get nearer under the island. It was very thick foggy weather, and as we stood to the north eastward, we came to very uncertain depths; at one cast twenty fathom, the next seven, then ten, five, eight, and three, and coming to the other tack, we were worse than we were before, the currents making a fool of our best judgments in the thick fog, when we could see no land marks. It pleased God that we got clear of them, and endeavoured to get under the lee of the island. This being not able to do, we were fain to come to an anchor in 35 fathom, some two leagues off the shore. All this afternoon (and indeed all night too) it did snow and hail, and was very cold.

The 25th we weighed, and thought to get to the eastward; but as we tack'd to and again, the wind shifted so in our teeths, that it put us within a quarter of a mile of the very shore; where we chopt to an anchor, and rid it out for life and death. Such miseries as these we endured amongst these shoals and broken grounds, or rather more desperate than I have related (very unpleasant perchance to be read) with snow, hail, and stormy weather, and colder than ever I felt it in *England*, in my life. Our shoot-anchor was down twice or thrice a day,

5 X

and

and extreme pains made a great part of the company sickly.

All this lasted with us until the 30th of this month of *September*, which we thought would have put an end to our miseries; for now we were driven amongst rocks, shoals, over-falls, and breaches round about us, that which way to turn we knew not; but there rid amongst them in extremity of distress. All these perils made a most hideous and terrible noise in the night season; and I hope it will not be accounted ridiculous, if I relate with what meditations I was affected, now and then, amongst my ordinary prayers; which I here afford the reader, as I there conceived them in these few ragged and torn rhimes.

*Oh my poor soul, why dost thou grieve to see,  
So many deaths muster to murder me?  
Look to thyself, regard not me; for I  
Must do (for what I came) perform or die.  
So thou mayst free thyself from being in  
A dungeon, a mere sink of sin;  
And happily be freed, if thou believe,  
Truly in God through Christ, and ever live.  
Be therefore glad: yet e'er thou go from hence,  
For our joint sins, let's do some penitence,  
Unfeignedly together. When we part,  
I'll wish the angels joy, with all my heart.  
We have with confidence relied upon  
A rusty wire, touch'd with a little stone,  
Incompar's'd round with paper, and alas,  
To house it harmless, nothing but a glass,  
And thought to shun a thousand dangers, by  
The blind direction of this senseless flies,  
When the fierce winds shatter'd black nights  
around,  
Whose pitchy clouds, spitting forth fire and  
thunder,  
Hath shook the earth, and made the ocean  
roar;  
And run to hide it in the broken shore:  
Now thou must steer by faith; a better guide,  
'Twill bring thee safe to heaven against the  
tide  
Of Satan's malice. Now let quiet gales  
Of saving Grace inspire thy zealous sails.*

The first of *October* was indifferent fair weather, and with a windward tide, out went our boat to found a channel to help us out of this perilous place. The boat within two hours returned, and told us how she had been a way where there was no less than 12 fathom. We presently thereupon weigh'd, but found it otherwise, and came amongst many strange races and over-falls, upon which there went a very great and breaking sea. As we proceeded, the water shoal'd to six fathom. Well! there was no remedy, we must go forward, happy be lucky, seeing there neither was any riding, and as

little hope to turn any way with a sail, but that there appear'd present death in it. It pleased God so to direct us, that we got thro' it, having no less than five fathoms, and all very uncertain depths. The water sometimes deepen'd to twenty fathom, then upon a sudden, it shoal'd to seven, six, and five fathoms; so we struck all our sails amain, and chopp'd to an anchor, where we rid till midnight, for life and death, it blowing a merciless gale of wind, and the sea going very lofty, and all in a breach. The ground was foul ground too, inasmuch that we doubted our cable every minute.

The second in the morning was little wind; wherefore taking the opportunity of the tide, the boat went forth to sound; which returning again in two hours, told us how they had sounded about that shoal, and had found a place of some safety to ride in, and had been in no less water than five fathom. We weigh'd, and found our cable galled in two places; which had soon failed us, if the foul weather had continued. We stood the same way that the boat did direct us; but it proved so calm, that we came to an anchor in eighteen fathom. I took the boat, and went ashore on an island that was to the southward of us, which I named, *The earl of Danby's island*. From the highest place in it, I could see it all broken grounds and shoals to the southward; and rather worse than any thing better than that which we had been in. I found that the salvages had been upon it, and that it was full of wood. I made haste to the boat to found the bay for fear of shoals and sunken rocks, but found it indifferent good. Toward the evening it began to blow hard; wherefore we made towards the ship. She put forth a buoy and a warp; and we rowing for life to recover her, were put to the leeward of her; but by getting hold of the warp, we hall'd up to her. The boat we left half full of water, ourselves being as wet as drown'd rats; and it made us the more rejoice, that we had escap'd this great danger. All this night we had a very hard rode-steed, it blowing a most violent gale of wind, with snow and hail.

The third about noon the wind dull'd, and we had up our anchor, standing in farther into the bay into four fathom and a half water. Here we came again to an anchor, with our second anchor; for many of our men are now sick, and the rest so weaken'd, that we can hardly weigh our shoot-anchor. I took the boat, and went presently ashore to see what comfort I could find. This was the first time that I put foot on this island, which was the same that we did after winter upon. I found the tracks of deer, and saw some fowl; but that that did

rejoice me most, was, that I did see an opening into the land, as if it had been a river. To it we make with all speed, but found it to be barr'd, and not two foot water at full sea on the bar; and yet within a most excellent fine harbour, having four fathom water. In the evening I returned aboard, bringing little comfort for our sick men more than hopes.

The fourth it did snow and blow very hard, yet I got ashore, and appointed the boat to go to another place (which made like a river) and to found it. In the mean time I went with four more, some four or five miles up into the country, but could find no relief all that way for our sick, but a few berries only. After we had well wearied ourselves in the troublesome woods, we returned to the place I had appointed the boat to tarry for me; where at my coming I still found her, she having not been where I had order'd her, for it had blown such a fierce gale of wind, that she could not row to windward. Thus we returned aboard with no good news. It continued foul weather, with snow and hail, and extreme cold, till the sixth, when with a favouring wind, we stood in nearer to the shore, and here moor'd the ship.

The seventh it snow'd all day, so that we were fain to clear it off the decks with shovels, and it blew a very storm withal. It continued snowing and very cold weather, and it did so freeze, that all the bows of the ship, with her beak-head, was all ice; about the cable also was ice as big as a man's middle. The bows of the boat were likewise frozen half a foot thick, so that we were fain to hew and beat it off. The sun did shine very clear, and we tore the topails out of the tops, which were hard frozen in them, into a lump; so that there they hung a sunning all day, in a very lump; the sun not having power to thaw one drop of them. After the boat was fitted, we rowed towards the shore, but could not come near the place where we were used to land, for that it was all thicken'd water with the snow that had fallen upon the sands, that are dry at low water. This made it so difficult to row, that we could not get through it with four oars, yet something higher to the westward, we got ashore. Seeing now the winter to come thus extremely upon us, and that we had very little wood aboard, I made them fill the boat, and went aboard; and sent the carpenter and others to cut wood, others to carry it to the water-side, whilst the boat brought it aboard; for I doubted that we were likely to be debar'd the shore, and that we should not go to and again with the boat. It was miserable and cold alrea-

dy aboard the ship; every thing did freeze: in the hold, and by the fire-side. Seeing therefore that we could no longer make use of our sails (which be the wings of a ship) it rais'd many doubts in our minds that here we must stay and winter. After we had brought so much wood aboard as we could conveniently stow, and enough as I thought would have lasted two or three months, the sick men desired that some little house or hovel might be built ashore, whereby they might be the better sheltered, and recover their healths. I took the carpenter (and others whom I thought fit for such a purpose) and chusing out a place, they went immediately to work upon it. In the mean space, I myself, accompanied with some others, wandered up and down in the woods, to see if we could discover any signs of favages, that so we might the better provide for our safeties against them. We found no appearance that there were any on this island, nor near unto it. The snow by this time was half-leg high; and stalking thro' it, we return'd comfortless to our companions, who had all this time wrought well upon our house. They aboard the ship took down our top-sails in the mean while, and made a great fire upon the hearth in the hatch-way; so that having well thaw'd them, they folded them up, and put them betwixt decks, that if we had any weather, they might bring them again to yard. Thus in the evening we returned aboard.

The twelfth we took our main-fail from the yard, which was hard frozen to it, and carried it ashore to cover our house withal, being first fain to thaw it by a great fire. By night they had covered it, and had almost hedged it about; and the six builders did desire to lie in it ashore that night, which I condescended unto, having first fitted them with muskets and other furniture, and a charge to keep good watch all night. Moreover, they had ashore two greyhounds, (a dog and a bitch) which I had brought out of *England*, to kill us some deer, if happily we could find any.

By the 13th at night our house was ready; and our six builders desired they might travel up into the country to see what they could discover.

The 14th, betimes in the morning, being fitted with munition, and their order to keep together (but especially to seek out some creek or cove for our ship) they departed. We aboard took down our own top-masts and their rigging, making account if we did remove, to make use of our foresail and mizen.

The 15th in the evening our hunters returned very weary, and brought with them a small lean deer, in four quarters, which rejoiced

rejoiced us all, hoping we should have had more of them to refresh our sick men withal. They reported, that they had wander'd above twenty miles, and had brought this deer above twelve miles, and that they had seen nine or ten more. The last night they had a very cold lodging in the woods; and so it appeared, for they look'd all almost starved, nor could they recover themselves in three or four days after. They saw no sign of salvages, nor of any ravening wild beasts, nor yet any hope of harbour.

The 17<sup>th</sup> my lieutenant, and five more, desired they might try their fortunes in travelling about the island. But they had far worse luck than the others, although they endured out all night, and had wandered very far in the snow (which was now very deep) and returned comfortless, and miserably disabled with the coldness. But what was worse than all this, they had lost one of their company, *John Barton*, namely, our gunner's mate; who being very weary, merely to save the going about, had attempted to go over a pond, that was a quarter of a mile over; where when he was in the very midst, the ice brake and closed upon him, and we never saw him more. Considering these disasters, I resolved to fish no more with a golden hook, for fear I weaken'd myself more with one hunting, than twenty such deers could do me good. Being now assured, that there were no salvages upon the island, nor yet about us on the other islands; no, nor on the main neither, as far as we could discover (which we farther proved by making of fires) and that the cold season was now in that extremity, that they could not come to us, if there were any; we comforted and refreshed our selves, by sleeping the more securely. We chang'd our island garrison every week, and for other refreshing we were like to have none till the spring.

From this 10th to the 29th it did (by *interims*) snow and blow so hard, that the boat could hardly adventure ashore, and but seldom land, unless the men did wade in the thick congealed water, carrying one another. We did sensibly perceive withal, how we did daily sink into more miseries. The land was all deep cover'd with snow, the cold did multiply, and the thick snow-water did increase; and what would become of us, our most merciful God and preserver knew only.

The 29th I observed an eclipse of the moon, with what care possibly I could, both in the trial of the exactness of our instruments, as also in the observation. I refer you to the observation in the latter end of this relation, where it is at large describ'd. This month of *October* ended with snow and

bitter cold weather.

The first of *November* I cast up my accounts with the steward concerning our victuals, the third part of our time being this day out. I found him an honest man; for he gave me an account every week what was spent, and what was still in the hold remaining under his hand. I would take no excuse of leakage or other waste, unless he did daily shew it me. Every month I made a new survey; and every six months put what we had spared by itself; which now was at least a month's provision of bread, and a fortnight's of peas, and fish, &c.

The third the boat endeavoured to get ashore, but could not get thro' the thick congealed water.

The fourth they found a place to get ashore, and so once in two or three days, till the ninth, bringing beer to our men ashore in a barrel, which would freeze firmly in the house in one night. Other provision they had store. The ice beer being thaw'd in a kettle, was not good; and they did break the ice of the ponds of water, to come by water to drink. This pond-water had a most loathsome smell with it; so that doubting lest it might be infectious, I caus'd a well to be sunk near the house. There we had very good water, which did taste (as we flatter'd our selves with it) even like milk.

The tenth (having store of boards for such a purpose) I put the carpenter to work, to make us a little boat, which we might carry (if occasion were) over the ice, and make use of her, where there was water. At noon I took the latitude of this island by two quadrants, which I found to be 52.00. I urged the men to make traps to catch foxes, for we did daily see many. Some of them were pied, black and white; whereby I gathered that there were some black foxes, whose skins, I told them, were of a great value; and I promised, that whosoever could take one of them, should have the skin for his reward. Hereupon they made divers traps, and waded in the snow (which was very deep) to place them in the woods.

The twelfth our house took fire, but we soon quenched it. We were vain to keep an extraordinary fire night and day; and this accident made me order a watch to look to it continually; seeing, that if our house and clothing should be burnt, that all we were but in a woful condition. I lay ashore till the 17th, all which time our miseries did increase. It did snow and freeze most extremely. At which time we looking from the shore towards the ship, she did look like a piece of ice in the fashion of a ship, or a ship resembling a piece of ice. The snow

was all frozen about her, and all her fore-part firm ice, and so was she on both sides also. Our cables froze in the hawse, wonderful to behold. I got me aboard, where the long nights I spent, with tormenting cogitations; and in the day time, I could not see any hope of saving the ship. This I was assured of, that it was most impossible to endure these extremities long. Every day the men must beat the ice off the cables; while some within board, with the carpenters long calking iron, did dig the ice out of the hawses; in which work, the water would freeze on their clothes and hands, and would so benumb them, that they could hardly get into the ship, without being heavy'd in with a rope.

The 19th, our gunner (who as you may remember, had his leg cut off) did languish irrecoverably, and now grew very weak; desiring, that for the little time he had to live, he might drink sack altogether, which I ordered he should do.

The 22d in the morning he died. An honest and a strong-hearted man. He had a close boarded cabin in the gunroom, which was very close indeed; and as many clothes on him as was convenient, (for we wanted no clothes) and a pan with coals, and a fire continually in his cabin: For all which warmth, his plaister would freeze at his wound, and his bottle of sack at his head. We committed him at a good distance from the ship unto the sea.

The 23d, the ice did increase extraordinarily, and the snow lay on the water in flakes, as it did fall; much ice withal drove by us, yet nothing hard all this while. In the evening, after the watch was set, a great piece came athwart our hawse, and four more following after him, the least of them a quarter of a mile broad; which in the dark did very much astonish us, thinking it would have carried us out of the harbour, upon the shoal's eastern-point, which was full of rocks. It was newly congealed, a matter of two inches thick, and we broke thorough it, the cable and anchor enduring an incredible stress, sometimes stopping the whole ice. We shot off three muskets, signifying to our men ashore, that we were in distress; who answered us again, but could not help us. By ten a clock it was all past; nevertheless, we watched carefully, and the weather was warmer than we had felt it any time this month. In the mornings, at break of day, I sent for our men aboard, who made up the house, and arrived by ten, being driven by the way, to wade thorough the congealed water, so that they recovered to the boat with difficulty. There drove by the ship many pieces of ice, though not so large as the

former, yet much thicker: One piece came foul of the cable, and made the ship drive.

As soon as we were clear of it, we joined our strengths together, and had up our easternmost anchor; and now I resolved to bring the ship aground, for no cables nor anchors could hold her: But I will here show you the reasons why I brought her no sooner aground. First, it was all stony-ground, some stones lying dry, three or four foot above water; so that it was to be suspected, that it was the like all about us. Secondly, it did ordinarily flow but two foot and a half here; and if she should bed deep in the sands, we could not ever come to dig her out again; for that she would not be dry, by four or five foot. Thirdly, it was a loose sand, which might rise with the surf, or so mount about her, that all our weak powers could not heave it away in the next spring time. Fourthly, we doubted the tides would not high so much in the summer as they did now. Fifthly, We could not bring her out of the tides way, which doth run something quick here; and the ice, besides, might drive and mount up upon her, and so overset her, or tear her, and carry away her planks, iron works and all; so that we should have nothing left to finish our pinnace with. Sixthly, If it did blow a storm at N. W. or thereabouts, the water would flow ten foot and upwards; and that wind being off the shore, it would blow away all the ice, and there would come in an extraordinary great surf about the shoaled eastern-point, which was occasioned by a deep overfall. Moreover, she would beat extremely; and if she were put up by the sea, or that surf, it was very doubtful that we should never have her off again. For these reasons we endured all the extremity, still hoping upon some good and fortunate accident. But now all our provident designs we saw to become foolishness; and that a great deal of miserable labour had been spent in vain by us. With the flood we weighed our westernmost anchor, perceiving God's assistance manifestly, because it happened to be fine warm weather; otherwise we had not been able to work. The wind was now south, which blew in upon the shore, and made the lowest tides. We brought the ship into twelve foot water, and hid out one anchor in the offing, and another in shoaled water, to draw her a land at command. Our hope also was, that some stones that were to the westward of us, would send off some of the ice. We then being about a mile from the shore, about ten a clock in the dark night, the ice came driving upon us, and our anchors came home. She drove some two cables length; and the wind

blowing

blowing on the shore, by two a clock she came aground, and stopp'd much ice; yet she lay well all night, and we took some rest.

The 25th the wind shifted easterly, and put abundance of ice on us. When the flood was made, we encouraged one another, and to work we go, drawing home our anchors by main force, under great pieces of ice, our endeavour being to put the ship to the shore. But to our great discomforts, when the half tide was made, (which was two hours before high water) the ship drove amongst the ice to the eastward, (do what we could) and so would have on the shoaled rocks. As I have formerly said, these two days, and this day, was very warm weather, and it did rain, which it had not yet but once done, since we came hither; otherwise, it had been impossible we could have wrought. Withal, the wind shifted also to the south, and at the very instant, blew a hard puff, which so continued for half an hour. I caus'd our two topmasts to be had up from betwixt decks, and we hoisted them up with ropes in all haste, and we forced the ship ashore, when she had not half a cable's length to drive on the rocky shoals. In the evening we broke way thorough the ice, and put an anchor to shoreward in five foot water, to keep her to the shore if possible it might be. Here sir *Hugh Willoughby* came into my mind, who without doubt was driven out of his harbour in this manner, and so starved at sea. But God was more merciful to us. About nine a clock at night, the wind came up at N. W. and blew a very storm. This wind was off the shore, which blew away all the ice from about us, long before we were afloat. There came in a great rowling sea withal about the point, accompanied with a great surf on the shore. And now were we left to the mercy of the sea on the ground. By ten, she began to rowl in her dock; and soon after, began to beat against the ground. We stood at the capstang as many as could, others at the pumps; for we thought that every fifth or sixth blow would have staved her to pieces. We heaved to the uttermost of our strengths to keep her as near the ground as we could. By reason of this wind, it flowed very much water, and we drew her up so high, that it was doubtful if ever we should get her off again. She continued thus beating, till two a clock the next morning, and then she again settled. Whereupon we went to sleep to restore nature; seeing the next tide we expected to be again tormented.

The 26th, in the morning tide, our ship did not float, whereby we had some quietness. After prayers, I called a consulta-

tion of the master, my lieutenant, the mates, carpenter, and boatswain; to whom I propos'd, that now we were put to our last shifts, and therefore they should tell me what they thought of it: Namely, whether it were not best, to carry all our provision ashore; and that when the wind should come northerly, it were not safest to draw her farther off, and sink her. After many reasonings they allowed of my purpose, and so I communicated it to the company, who all willingly agreed to it. And so we fell to getting up of our provisions; first our bread, of which we landed this day two dry-fats with a hoghead of beef; having much ado to fet the boat thorough the thick congealed water. In the evening, the wind came up at N. E. and E. and fill'd the bay choakful of ice.

The 27th, the bay continued full of ice, which I hoped would so continue and freeze, that we should not be put to sink our ship. This day we could land nothing.

The 28th, at break of day, three of our men went ashore over the ice, unknown to me; and the wind coming up at W. drove the ice from betwixt us and the shore, and most part out of the bay also: And yet not so, that the boat could go ashore for any thing. I made the carpenter fit a place against all sudden extremities, for that with the first N. W. or northerly wind, I meant to effect our last project. In the run of her, on the starboard side, he cut away the sealing and the plank to the sheathing some four or five inches square, some four foot high from the keel of her, that so it might be boared out at an instant. We brought our bread which was remaining in the bread room, up into the great cabin, and likewise all our powder, setting much of our light dry things betwixt decks.

The 29th, at five a clock in the morning, the wind came up at W. N. W. and began to blow very hard. It was ordinary for the wind to shift from the W. by the N. round about. So first I order'd the cooper to go down in hold, and look to all our cask; those that were full, to mawle in the bungs of them; those that were empty, to get up, or if they could not be gotten up, to stave them. Then to quail all our cables upon our lower tire; and to lay on our spare anchors, and any thing that was weighty, to keep it down from rising. By seven a clock, it blew a storm at N. W. our bitter enemy. The ship was already bedded some two foot in the sand, and whilst that was a flowing, she must beat. This I before had in my consideration; for I thought she was so far driven up, that we should never get her off. Yet we had been so

ferreted by her last beating, that I resolv-  
ed to sink her right down, rather than run  
that hazard. By nine a clock, she began  
to rowl in her dock, with a most extraor-  
dinary great sea that was come, which I  
found to be occasioned by the foremention-  
ed overfall. And this was the fatal hour  
that put us to our wits end. Wherefore I  
went down in hold with the carpenter, and  
took his augur and bored a hole in the ship,  
and let in the water. Thus with all speed,  
we began to cut out other places to bore  
thorough, but every place was full of nails.  
By ten, notwithstanding, the lower tire was  
covered with water; for all which, she be-  
gan so to beat in her dock, more and  
more, that we could not work, nor stand  
to do any thing in her: Nor would she  
sink so fast as we would have her, but con-  
tinued beating double blows; first abaft,  
and then before, that it was wonderful  
how she could endure a quarter of an hour  
with it. By twelve a clock, her lower  
tire rose; and that did so counterbeat on  
the inside, that it beat the bulk heads of  
the bread-room, powder-room, and fore-  
piece, all to pieces; and when it came be-  
twixt decks, the chests fled widdly about,  
and the water did flash and fly wonderfully;  
so that now we expected every minute when  
the ship would open and break to pieces.  
At one a clock she beat off her rudder,  
and that was gone we knew not which  
way. Thus she continued beating till three  
a clock, and then the sea came up on the  
upper deck, and soon after, she began to  
settle. In her, we were fain to sink the most  
part of our bedding and clothes; and the  
chirurgeons chest with the rest. Our men  
that were ashore, stood looking upon us,  
almost dead with cold, and forrows to see  
our misery and their own. We look'd  
upon them again, and both upon each other  
with woful hearts. Dark night drew on,  
and I bade the boat to be haled up, and  
commanded my loving companions to go  
all into her; who (in some refusing com-  
pliments) expressed their faithful affections  
to me, as loth to part from me. I told  
them, that my meaning was to go ashore  
with them. And thus, lastly, I forsook  
the ship.

We were seventeen poor souls now in the

boat; and we now imagined, that we were  
leapt out of the frying pan into the fire:  
The ebb was made, and the water extraor-  
dinary thick, congealed with snow; so  
that we thought assuredly, it would carry  
us away into the sea. We thereupon dou-  
ble mann'd four oars, appointing four more  
to sit ready with oars; and so with the  
help of God we got to the shore, hailing  
up the boat after us. One thing was most  
strange in this thick water: Namely, that  
there went a great swelling sea. Being ar-  
rived upon the land, we greeted our fellows  
the best we could; at which time they  
could not know us, nor we them by our  
habits nor voices, so frozen all over we  
were, faces, hair, and apparel. And here  
I mean to take breath awhile, after all this  
long and unpleasant relation of our misera-  
ble endeavours, craving leave first of all to  
speak a word or two in general.

The winds, since we came hither, have  
been very variable and unconstant; and till  
within this fortnight, the southerly wind  
was the coldest. The reason I conceive  
to be, for that it did blow from the main  
land, which was all covered with snow;  
and for that the north winds came out of  
the great bay which hitherto was open.  
Add to that, we were now under a fourth  
bank which did shelter us, so that we were  
not so sensible of it.

A N. W. a N. W. by N. and a N. W.  
wind (if it blew a storm) would raise the  
tides extraordinarily: And indeed, from  
the W. N. W. to the N. N. E. would  
raise the tides in proportion, as they did  
blow from the middle point: The wind  
being on the opposite points (if it blew) it  
would flow very little at all. The harder  
it blew, the less water it would flow. If  
it were little wind or calm, it would flow  
indifferently. The tides do high ordina-  
rily (without being forced) about three  
foot; but being forced with the fore-  
mentioned winds, upwards of ten foot. I  
could perceive no difference betwixt neap  
and spring tides: It flows half tide; that  
is, the flood comes from the northward,  
and thither returns again, two hours be-  
fore it be high water; and it is commonly  
so seen in most bays or inlets.

# OUR WINTERING.

**A**FTER we had haled up the boat, we went along the breach side in the dark, towards our house, where we made a good fire; and with it and bread and water, we thawed and comforted ourselves, beginning after that to reason one with another, concerning our ship. I requir'd that every one should speak his mind freely. The carpenter (especially) was of the opinion, that she was founder'd, and would never be serviceable again. He alledged, that she had so beaten, that it was not possible, but that all her joints were loose, and seams open; and that by reason it flowed so little water, and no creek nor cove being near, wherein to bring her aground, he could not devise how he might come to mend it. Moreover, her rudder was lost, and he had no iron work to hang on another. Some alledged, that we had heaved her up so high upon the sands, that they thought we should never have her off again, and that they were assured she was already dock'd three foot. Others, that she lay in the tides way, and that the ice might tear her to pieces off the ground; besides which, two of our anchors we could not now get from under the ice; which when the ice brake (which would be of a great thickness by the spring) would break our anchors to pieces, and then we should have no anchors to bring us home withal, supposing we got off the ship, and that she proved found also. I comforted them the best I could with such like words; My masters and faithful companions, be not dismay'd for any of these disasters, but let us put our whole trust in God; it is he that giveth and he that taketh away; he throws down with one hand, and raiseth up with another: His will be done. If it be our fortunes to end our days here, we are as near heaven as in *England*; and we are much bound to God Almighty for giving us so large a time of repentance, who as it were daily calls upon us, to prepare ourselves for a better life in heaven. I make no doubt, but he will be merciful to us both here on earth, and in his blessed kingdom; he doth not in the mean time deny, but that we may use all honest means to save and prolong our natural lives withal; and in my judgment, we are not yet so

far past hope of returning into our native countries, but that I see a fair way by which we may effect it. Admit the ship be founder'd, (which God forbid, I hope the best) yet have those of our own nation, and others, when they have been put to these extremities, even out of the wreck of their lost ship, built then a pinnace, and recovered to their friends again. If it be objected, that they have happened into better climates, both for temperateness of the air, and for pacifick and open seas; and provided withal, of abundance of fresh victuals; yet there is nothing too hard for courageous minds, which hitherto you have shewn, and I doubt not will still do, to the uttermost.

They all protested to work to the uttermost of their strength, and that they would refuse nothing that I should order them to do, to the uttermost hazard of their lives. I thank'd them all, and to the carpenter for his cheerful undertaking, I promised to give him so much plate presently, as should be worth ten pound sterling; and if so be I went to *England* in the pinnace, I would give her him freely, and fifty pounds in money over and above; and would moreover gratify all them, that I should see painful and industrious. Thus we then resolv'd, to build us a new pinnace with the timber we should get upon the island; that in the spring, if we found not the ship serviceable, we might tear her up, and plank her with the ships planks. And so for this night we settled ourselves close about the fire, and took some rest till day-light.

The 30th betimes in the morning, I caus'd the chirurgeon to cut the hair of my head short, and to shave away all the hair of my face, for that it was become intolerable, and that it would be frozen so great with ices: The like did all the rest.

The first of *November* we fitted our selves to work. The first thing we were to do, was to get our clothes and provisions ashore, and therefore I divided the company. The master and a convenient company with him, were to go aboard, and get things out of the hold. The cock-swain with his gang, were to go in the boat, to bring and carry things ashore. Myself, with the rest, to carry it half a mile thro' the snow, unto the place

place where we intended to build a store-house : As for the heavier things, we purposed to lay them upon the beach. In the afternoon the wind was at south south west, and the water veer'd to so low an ebb, that we thought we might get something out of our hold. We launched our boat therefore, and with oars set thro' the thick congealed water : It did freeze extream hard, and I did stand on the shore with a troubled mind, thinking verily that with the ebb the boat would be carried into the sea, and that then we were all lost men. But by God's assistance, they got safely to the ship, and made a fire there, to signify their arrival aboard. They fell presently to work, and got something out of the hold, upon the decks ; but night coming on, they durst not adventure to come ashore, but lay on the bed in the great cabin, being almost starved.

The first of December was so cold, that I went the same way over the ice to the ship, where the boat had gone yesterday. This day we carried upon our backs in bundles, 500 of our Fish, and much of our bedding and clothes, which we were fain to dig out of the Ice.

The 2d was mild Weather ; and some of the men going over the ice, fell in, and were very hardly recovered ; so that this day we could land nothing, neither by boat nor back : I put them therefore to make us a store-house ashore. In the evening, the wind came up at west ; and the ice did break and drive out of the bay : It was very deep and large ice, that we much doubted it would have spoiled the ship.

The 3d day, there were divers great pieces of ice that came athwart the ship, and she stopt them, yet not so, that we could go over them. We found a way for the boat ; but when she was laden, she drew four foot water, and could not come within a flight-shot of the shore. The men therefore must wade through the thick congealed water, and carry all things out of the ship upon their backs. Every time they waded in the ice, it so gathered about them, that they did seem like a walking piece of ice, most lamentable to behold. In this extream cold evening they cut away as much ice from about the boat as they could, and pickt it with hand-spikes out of her, and endeavouring to hoise her into the ship : There being small hope that she could go to and again any more. But use what means they could, she was so heavy, that they could not hoise her in, but were fain there to leave her in the tackles by the ship's side.

The 4th, being sunday we rested ; and performed the sabbath-duties of a christian.

The 5th and 6th were extream cold ;

Vol. II.

and we made bags of our store-shirts, and in them carried our loose bread over the ice ashore upon our backs. We also digged our clothes and new-falls with hand-spikes of iron, out of the ice, and carried them ashore, which we dried by a great fire.

The 7th day was so extreamly cold, that our noses, cheeks, and hands, did freeze as white as paper.

The 8th and 9th it was extream cold, and it did snow much, yet we continued our labour, in carrying and rowling things ashore. In the evening the water raised the ice very high, and it did break two thoughts of our boat, and break in the side of her ; but for that time we could not help it.

The 10th, our carpenter found timber to make a keel, and a stern, for our pinnace ; the rest wrought about our provisions until the 13th day ; and that we spent in digging our boat out of the ice, which we were fain to do to the very keel ; and dig the ice out her, and then we got her up on the ice ; in which doing, many had their noses, cheeks, and fingers, frozen as white as paper. The cold now encreased most extreamly. By the 19th, we could get no more things out of our hold ; but were fain to leave five barrels of beef and pork, all our beer, and divers other things which were all firm frozen in her.

The 21st was so cold, that we could not go out of the house.

The 23d we went to heave our boat ashore, running her over our oars, but by ten a clock there came such a thick fog, that it was as dark as night. I made them give over, and make what haste we could to the shore ; which we had much ado to find, for the time, losing one another. At the last, we met all at the house, the miserablest frozen that can be conceived. Upon divers, the cold had raised blisters as big as wall-nuts. This we imagined to come, by reason that they came too hastily to the fire. Our well was now frozen up ; so that dig as deep as we could, we can come by no water. Melted snow water is very unwholesome, either to drink or to dress our victuals. It made us so short-breathed, that we were scarce able to speak. All our sack, vinegar, oil, and every thing else that was liquid, was now frozen as hard as a piece of wood, and we must cut it with a hatchet. Our house was all frozen on the inside, and it froze hard within a yard of the fire-side. When I landed first upon this island, I found a spring under a hill-side ; which I then observing, had caused some trees to be cut for marks to know the place again by. It was about three quarters of a mile from our house. I sent three of our men which had been formerly with me, thither upon the

5 Z

24th :

24th: These wading thorow the snow, at last found the place, and shoveling away the snow, they made way to the very head of it. They found it spring very strongly, and brought me a can of it, for which I was right joyful. This spring continued all the year, and did not freeze, but that we could break the ice and come to it. We labour'd very hard these three or four days, to get wood to the house, which we found to be very troublesome, through the deep snow.

We then settled our bedding and provisions, providing to keep *Christmas-day* holy, which we solemnized in the joyfullest manner we could; so likewise did we *St. John's day*; upon which we named the wood we did winter in, in memory of that honourable knight, *sir John Winter, Winter's Forest*. And now instead of a *Christmas* tale, I will here describe the house that we did live in, with those adjoining.

When I first resolved to build a house, I chose the warmest and convenientest place, and the nearest the ship withal. It was amongst a tuft of thick trees under a south-bank, about a flight-shot from the sea's side. True it is, that at that time we could not dig into the ground, to make us a hole or cave in the earth, (which had been the best way) because we found water within two foot digging, and therefore that project fail'd. It was a white light sand, so that we could by no means make up a mud-wall. As for stones, there were none near us, which moreover were all now covered with the snow. We had no boards for such a purpose, and therefore we must do the best we could, with such materials as we had about us.

The house was square, about twenty foot every way, as much namely, as our main-course could well cover: First we drove strong stakes into the earth, round about, which we wattled with boughs, as thick as might be, beating them down very close. This our first work was six foot high on both sides, but at the ends almost up to the very top, there we left two holes for the light to come in at, and the same way the smoak did vent out also. Moreover I caufed at both ends, three rows of thick bush-trees, to be stuck up, as close together as might be possible. Then at a distance from the house, we cut down trees, proportioning them into lengths of six foot, with which we made a pile on both sides, six foot thick, and six foot high, but at both ends ten foot high, and six foot thick: We left a little low door to creep into, and a portal before that, made with piles of wood, that the wind might not blow into it. We next of all

fastened a rough-tree aloft over all, upon which we laid our rafters, and our main-course over those again; which lying thwart-ways over all, did reach down to the very ground on either side. And this was the fabrick of the outside of it. On the inside we made fast our bonnet-fails round about. Then we drove in stakes and made us bedstead frames, about three sides of the house, which bedsteads were double one under another, the lowermost being a foot from the ground. These we first fill'd with boughs, then we laid some spare fails on that, and then our bedding and cloaths. We made a hearth or cauld in the middle of the house, and on it made our fire; some boards we laid round about our hearth to stand upon, that the cold damp should not strike up into us. With our waft-clothes we made us canopies and curtains, others did the like with our small fails.

Our second house was not past twenty foot distant from this, and made for the watteling much after the same manner, but it was less, and covered with our fore-course: It had no piles on the south-side, but in lieu of that we piled up all our chests on the inside; and indeed the reflex of the heat of the fire against them, did make it warmer than the mansion-house. In this house we drest our victuals, and the subordinate crew did refresh themselves all day in it.

A third house (which was our store-house) we likewise made some twenty paces off from this, for fear of firing. This house was only a rough-tree fastened aloft, with rafters laid from it to the ground, and covered with our new suit of fails. On the inside we had laid small trees, and covered them over with boughs, and so stor'd up our bread and fish in it, about two foot from the ground, the better to preserve them. Other things lay more carelessly.

Long before *Christmas* our mansion-house was covered thick over with snow, almost to the very roof of it: And so likewise was our second house; but our store-house all over, by reason we made no fire in it. Thus we seem'd to live in a heap and wilderness of snow; forth a-doors we could not go, but upon the snow, in which we made us paths middle-deep in some places, and in one special place, the length of ten steps. To do this we must shovel away the snow first; and then by treading make it something hard under foot: The snow in this path was a full yard thick under us; and this was our best gallery for the sick men, and for mine own ordinary walking. And both houses and walks we did

did daily accommodate more and more, and make fitter for our uses.

The 27th we got our boat ashore, and fetcht up some of our provisions from the beach-side into the store-house; and so by degrees did we with the rest of our provisions, with extremity of cold and labour, making way with shovels thorow the deep snow, even from the sea-side unto our store-house. And thus concluded we the old year 1631.

January 1632.

The first of *January* (and for the most part of all the month) was extreme cold.

The 6th, I observed the latitude with what exactness I could, (it being very clear sun-shine weather) which I found to be 51. 52. This difference is, by reason that here is a great refraction.

The 21st I observed the sun to rise like an oval, along the horizon: I call'd three or four to see it, the better to confirm my judgment; and we all agreed that it was twice as long as it was broad. We plainly perceived withal, that by degrees as it gate up higher, it also recovered its roundness.

The 26th I observed, when the eastern-edge of the moon did touch the planet *Mars*, the *Lion's-Heart* was then in the east-quarter 21. 45. above the horizon; but all this was not done with that exactness that I have done other observations.

The 30th and 31st there appeared in the beginning of the night, more stars in the firmament than ever I had before seen by two thirds. I could see the cloud in *Cancer* full of small stars, and all the *Via Lactea* nothing but small stars, and amongst the *Pleiades* a great many small stars. About ten a clock the moon did rise, and then a quarter of them was not to be seen. The wind for the most part of this month hath been northerly and very cold; the warmest of which time we employed our selves in fetching wood, working upon our pinnace, and other things that happened. In the beginning of this month the sea was all firmly frozen over, so that we could see no water any way. I hope it will not seem tedious to the readers, if I here deliver mine own opinion, how this abundance of ice comes to be ingendered.

The land that encircles this great bay, (which lies in a broken irregular form, making many little shoald bays and guts, being moreover full of islands and dry sands) is for the most part low and flat, and hath flat shoalds adjoining to it, half a mile or a mile, that are dry at low

water. Now you must know that it flows half tide (as I have often experienced) that is, from whence the flood cometh, the water thither returneth, two hours before it be high-water or full sea. It seldom rains after the middle of *September*, but snows, and that snow will not melt on the land nor sands: At low water when it snows (which it doth very often) the sands are all covered over with it, which the half-tide carries officiously (twice in 24 hours) into the great bay, which is the common rendezvous of it. Every low water are the sands left clear, to gather more to the increase of it. Thus doth it daily gather together in this manner, till the latter end of *October*, and by that time hath it brought the sea to that coldness, that as it snows the snow will lie upon the water in flakes, without changing its colour, but with the wind is wrought together, and as the winter goes forward, it begins to freeze on the surface of it, two or three inches or more in one night; which being carried with the half-tide, meets with some obstacle, (as it soon doth) and then it crumples, and so runs upon itself, that in a few hours it will be five or six foot thick. The half-tide still flowing, carries it so fast away, that by *December* it is grown to an infinite multiplication of ice. And thus by this storing of it up, the cold gets the predomination in the sea, (which also furnisheth the springs and water in the low flat lands) that it cools it like itself. This may appear by our experience, though in all this I freely submit myself unto the better learned. Our men found it more mortifying cold to wade thorow the water in the beginning of *June*, when the sea was all full of ice, than in *December* when it was increasing. Our well, moreover, out of which we had water in *December*, we had none in *July*.

The ground at ten foot deep was frozen: The quantity of the ice, may very easily be made appear, by mathematical demonstration; and yet I am not of the opinion, that the bay doth freeze all over. For the 21st the wind blowing a storm at north, we could perceive the ice to rise something in the bay.

February 1632.

The cold was as extreme this month as at any time we had felt it this year; and many of our men complained of infirmities, some of fore mouths, all the teeth in their heads being loose, their gums swollen, with black rotten flesh, which must every day be cut away. The pain was so fore on them, that they could not eat their ordinary

dinary meat. Others complained of pain in their heads and their breasts, some of weakness in their backs, others of aches in their thighs and knees, and others of swellings in their legs. Thus were two thirds of the company under the surgeon's hand; and yet nevertheless they must work daily, and go abroad to fetch wood and timber, notwithstanding the most of them had no shoes to put on. Their shoes upon their coming to the fire, out of the snow, were burnt and scorcht upon their feet, and our store-shoes were all sunk in the ship. In this necessity they would make this shift, to bind clouts about their feet, and endeavoured by that poor help, the best they could to perform their duties. Our carpenter likewise is by this time fallen sick to our great discomforts. I practised some observations by the rising and setting of the sun, calculating the time of his rising and setting, by very true running-glasses: As for our clock and watch, notwithstanding we still kept them by the fireside, in a chest wrapt in clothes, yet were they so frozen, that they could not go. My observations by these glasses, I compared with the stars coming to the meridian. By this means we found the sun to rise 20 minutes before it should; and in the evening to remain above the horizon 20 minutes (or thereabouts) longer than it should do; and all this by reason of the refraction.

Since now I have spoken so much of the cold, I hope it will not be too coldly taken, if I in a few words make it some way to appear unto our readers.

We made three differences of the cold, all according to the places. In our house; in the woods; and in the open air, upon the ice, in our going to the ship.

For the last, it would be sometimes so extreme, that it was not indurable, no cloaths were proof against it, no motion could resist it. It would, moreover so freeze the hair on our eye-lids, that we could not see; and I verily believe that it would have stifled a man in a very few hours. We did daily find by experience, that the cold in the woods would freeze our faces, or any part of our flesh that was bare, but it was yet not so mortifying as the other. Our house on the out-side was covered two third parts with snow, and on the inside frozen and hang'd with ice-fickles. The cloathes on our beds would be covered with hoar-frost, which in this little habitation, was not far from the fire. But let us come a little nearer to it. The cook's tubs, wherein he did water his meat, standing about a yard from the fire, and which he did all day ply with melted snow-

water; yet in the night-season, whilst he slept but one watch, would they be firm frozen to the very bottom. And therefore was he fain to water his meat in a brais-kettle close adjoining to the fire; and I have many times both seen and felt by putting my hand into it, that side which was next the fire was very warm, and the other side an inch frozen: I leave the rest to our cook, who will almost speak miracles of the cold. The surgeon, who had hung his bottles of syrups and other liquid things, as conveniently as he could to preserve them, had them all frozen: Our vinegar, oil and sack, which we had in small cask in the house, was all firm frozen. It may farther in general be conceived, that in the beginning of *June* the sea was not broken up, and the ground was yet frozen; and thus much we found by experience in the burying of our men, in setting up the king's standard towards the latter end of *June*, and by our well our coming away in the beginning of *July*, at which time upon the land, for some other reasons, it was very weather.

March 1632.

The first of this month being *St. David's* day, we kept holiday, and solemnized it in the manner of the antient *Britains*, praying for his highness's happiness. *Charles* prince of *Wales*.

The 15th, one of our men thought he had seen a deer; whereupon he with two or three more desired that they might go to see if they could take it: I gave them leave; but in the evening they returned so disabled with cold, which did rise up in blisters under the soles of their feet, and upon their legs, to the bigness of walnuts, that they could not recover their former estate (which was not very well) in a fortnight alter.

The 26th three more desired that they also might go out to try their fortunes, but they returned worse disabled, and even almost stifled with the cold.

This evening the *Moon* rose in a very long oval along the horizon.

By the last of this month, the carpenter had set up 17 ground timbers and 34 saddles, and (poor man) he proceedeth the best he can, though he be fain to be led unto his labour.

In brief, all this month hath been very cold. The wind about the N. W. the snow as deep as it hath been all this winter: but to answer an objection that may be made; you were in a wood (may some men say unto us) and therefore you might

might make fire enough to keep you from the cold. It is true, we were in a wood, and under a south-bank too, or otherwise we had all starved. But I must tell you withal, how difficult it was to have wood in a wood: And first, I will make a muster of the tools we had. The carpenter in his chest had two axes indeed, but one of them was spoiled in cutting down wood to pile about our house before *Christmas*. When we came first a-land, we had but two whole hatchets, which in a few days broke two inches below the sockets. I called for three of the cooper's hatchets: The carpenter's axe and the cooper's belt hatchet I caused to be locked up; the other two hatchets to be new helv'd, and the blades of the two broken hatchets to be put into a cleft piece of wood, and then to be bound about with rope-yarn, as fast as might be, which must be repaired every day; and these were all the cutting-tools we had: Moreover, the 6th of *Feb.* the carpenter had out his best axe about something, and one of the company in his absence, by his undiscreeit handling of it, brake that too, two inches below the socket; we must henceforth order these pieces of tools the best we could; wherefore I gave order that the carpenter should have one of the cooper's hatchets; they that lookt for timber in the woods the other; and they that cut down wood to burn, were to have the two pieces: And this was before *Christmas*.

The three that were appointed to look crooked timber, must stalk and wade (sometimes on all four) thorow the snow; and where they saw a tree likely to fit the mould, they must first heave away the snow, and then see if it would fit the mould, if not, they must seek farther; if it did fit the mould, then they must make a fire to it, to thaw it, otherwise it could not be cut; then cut it down and fit it to the length of the mould, and then with other help get it home, a mile thorow the snow.

Now for our firing. We could not burn green wood; it would so smoke, that it was not indurable; yea, the men had rather starve without in the cold, than sit by it. As for the dry wood, that also was bad enough in that kind, for it was full of turpentine, and would send forth such a thick smoke, that would make abundance of soot, which made us all look as if we had been free of the company of chimney-sweepers. Our clothes were quite burnt in pieces about us, and for the most part we were all without shoes: but to our fuellers again. They must first (as the former) go up and down in the snow, till

they saw a standing dry tree; for that the snow covered any that were fallen. Then they must hack it down with their pieces of hatchets, and then others must carry it home thorow the snow. The boys with cutlasses must cut boughs for the carpenter; for every piece of timber that he did work, must first be thaw'd in the fire, and he must have a fire by him, or he could not work. And this was our continual labour throughout the forementioned cold, besides our tending of the sick and other necessary imployments.

April 1632.

The first of this month being *Easter-day*, we solemnized as religiously as God did give us grace. Both this day, and the two following holy-days were extreme cold: And now fitting all about the fire, we reasoned and considered together upon our estate. We had five men (whereof the carpenter was one) not able to do any thing. The boatwain and many more were very infirm; and of all the rest we had but five that could eat of their ordinary allowance. The time and season of the year came forwards apace, and the cold did very little mitigate. Our pin-nace was in an indifferent forwardness, but the carpenter grew worse and worse. The ship (as we then thought) lay all full of solid ice, which was weight enough to open the seams of any new and sound vessel, especially of one that had lain so long upon the ground as she had done. In brief, after my disputations, and laying open of our miserable and hopeles estates, I resolved upon this course: That notwithstanding it was more labour, and tho' we declined weaker still and weaker; yet that with the first warm weather, we would begin to clear the ship, that so we might have the time before us, to think of some other course. This being ordered, we lookt to those tools we had, to dig the ice out of her; we had but two iron-bars ashore, the rest were sunk in the ship, and one of them was broken too: Well, we fell to fitting of those bars, and of four broken shovels that we had, with which we intended (as after we did) to dig the ice out of her, and to lay that ice on a heap, upon the larboard-bow, and to sink down that ice to the ground so fast, that it should be a barricado to us, when the ice brake up, which we feared would tear us all to pieces.

The 6th was the deepest snow we had all this year, which filled up all our paths and ways, by which we were used to go unto the wood; this snow was something moist-

er and greater than any we had all this year; for formerly it was as dry as dust, and as small as sand, and would drive like dust with the wind.

The weather continued with this extremity until the 15th, at which time our spring was harder frozen, than it had been all the year before. I had often observed the difference betwixt clear weather and misty refractious weather, in this manner. From a little hill which was near adjoining to our house, in the clearest weather, when the sun shone with all the purity of air that I could conceive, we could not see a little island which bare off us S. S. E. some four leagues off; but if the weather were misty (as aforesaid), then we should often see it from the lowest place. This little island I had seen the last year, when I was on *Danby* island.

The 13th, I took the height of it instrumentally, standing near the sea-side, which I found to be 34 minutes, the sun being 28 degrees high. This shows how great a refraction here is. Yet may this be noted by the way, that I have seen the land elevated, by reason of the refractious air, and nevertheless the sun hath risen perfectly round.

The 16th was the most comfortable sunshine day that came this year; and I put some to clear off the snow from the upper decks of the ship, and to clear and dry the great-cabin, by making fire in it. Others I put to dig down thorow the ice, to come by our anchor, that was in shoal water, which the 17th in the afternoon we got up and carried aboard.

The 18th I put them to dig down thorow the ice, near the place where we thought our rudder might be. They digged down and came to water, but no hope of finding of it: We had many doubts that it might be fanded, or that the ice might have carried it away already the last year; or if we could not recover it by digging before the ice brake up and drove, there was little hope of it.

The 19th we continued our mining work aboard the ship, and returned in the evening to supper ashore. This day the master and two others desired that they might lie aboard, which I condescended to; for indeed they had lain very discommodiously all the winter, and with sick bed-fellows, as I my self had done, every one in that kind taking their fortunes. By lying aboard they avoided the hearing of the miserable groanings, and lamenting of the sick men all night long, enduring (poor souls) intolerable torments.

By the 21st we had laboured so hard, that we came to see a cask, and could like-

wise perceive that there was some water in the hold. This we knew could not be thawed water, because it did still freeze night and day very hard aboard the ship, and on the land also.

By the 23d in the evening, we came to pierce the forementioned cask, and found it was full of very good beer, which did much rejoyce us all, especially the sickmen, notwithstanding that it did taste a little of bulge-water. By this we at that time thought that the holes we had cut to sink the ship were frozen, and that this water had stood in the ship all the winter.

The 24th we went betimes in the morning to work, but found that the water was risen above the ice, where we had left work, about two foot; for that the wind had blown very hard at north the night before. In the morning the wind came about south, and blew hard, and although we had little reason for it, we yet expected a lower veer of the water. I thereupon put them to work on the out-side of the ship, that we might come to the lower hole, which we had cut in the stern-shoots. With much labour by night, we digged down thorow the ice to it, and found it unfrozen, (as it had been all the winter) and to our great comforts, we found that on the inside, the water was ebb'd even with the hole; and that on the outside it was ebb'd a foot lower. Hereupon I made a shot-board to be nail'd on it, and to be made as tight as might be, to try if the water came in any other way. As to the other two holes, we had digged on the inside, we found them frozen. Now I did this betimes, that if we found the ship foundered, we might resolve of some course to save or prolong our lives, by getting to the main before the ice were broken up; for as for our boat it was too little, and bulged; besides that, our carpenter was by this time just hope, and therefore little hope had we of our pinnace: But which was worst of all, we had not four men able to travel through the snow over the ice, and in this miserable estate were we at this present.

The 25th we satisfied our longing; for the wind now coming about northerly, the water rose by the ship's-side (where we had digged down) a foot and more above the hold, and yet did not rise within board. This did so encourage us, that we fell very lustily to digging, and to heave out the ice out of the ship. I put the cook and some others to thaw the pumps, who by continual pouring of hot water into them, by the 27th in the morning they had cleared one of them, which we assaying, found that it did deliver water very sufficiently. Thus we fell to pumping; and having cleared

cleared two foot water, we then left to have a second trial. Continuing our work thus in digging the ice, by the 28th we had cleared our other pump, which we also found to deliver water very well: We found likewise that the water did not rise any thing in hold.

The 29th it rained all day long a sure sign to us, that winter was broken up.

The 30th we were betimes aboard at work, which day and the 31st were very cold with snow and hail, which did pinch our sick men more than any time this year. This evening being *May* even, we returned late from our work to our house, and made a good fire, and chose ladies, and did ceremoniously wear their names in our caps, endeavouring to revive ourselves by any means. And because you hear us in this merry humour, I will make known to you what good cheer we kept at *Christmas* and *Easter*; and how we had dieted our selves all the winter.

At our coming forth of *England*, we were stored with all sort of sea provisions; as beef, pork, fish, &c. but now that we had little hope of refreshing, our cook did order it in this manner.

The beef which was to serve on *Sunday* night to supper, he did boil on *Saturday* night, in a kettle full of water, with a quart of oat-meal, about an hour. Then taking the beef out, he boiled the rest till it came to half the quantity; and this we called porridge, which with bread we did eat, as hot as we could; and after this we had our ordinary of fish. *Sunday* dinner we had pork and peas, and at night the former boiled beef made more porridge. In this manner our *Tuesday's* beef was boiled on the *Monday* nights; and the *Thursday's* upon the *Wednesday*. And thus all the week (except *Friday* night) we had some warm thing in our bellies every supper. And (surely) this did us a great deal of good. But soon after *Christmas* many of us fell sick, and had sore mouths, and could neither eat beef, pork, fish, nor porridge. Their diet was only this. They would pound bread or oatmeal in a mortar to meal; then fry it in a frying-pan with a little oil, and so eat it. Some would boil peas to a soft paste, and feed as well as they could upon that. For the most part of the winter, water was our drink. In the whole winter we took not above a dozen foxes; many of which would be dead in the traps two or three days oftentimes; and then when the blood was settled, they would be unwholesome. But if we took one alive, that had not been long in the trap, him we boiled, and made broth for the weakest sick men of him; the flesh of it being soft boiled, they did eat also.

Some white partridges we kill'd; but not worth the mentioning towards any refreshing.

We had three sorts of sick men: Those that could not move nor turn themselves in their beds, who must be tended like an infant. Others that were as it were crippled with scurvy-aches. And others, lastly, that were something better. Most of all had sore mouths. You may now ask me, how these infirm men could work? I will tell you: Our surgeon (who was diligent, and a sweet-condition'd man as ever I saw) would be up betimes in the mornings; and whilst he did pick their teeth, and cut away the dead flesh from their gums, they would bathe their own thighs, knees, and legs. The manner whereof was this: There were no trees, buds, nor herb, but we made trial of it; and this being first boiled in a kettle, and then put in a small tub and basin, they put it under them, and covered themselves with clothes upon it. This would so mollify the grieved parts, that although when they did rise out of their beds they would be so crippled, that they could scarce stand; yet after this done half an hour, they would be able to go (and must go) to wood through the snow, to the ship, and about their other business. By night they would be as bad again; and then they must be bathed, anointed, and their mouths again dress'd, before they went to bed. And with this diet, and in this manner, did we go through our miseries.

I ever doubted that we should be weakest in the spring; and therefore had I reserv'd a ton of *Alicant* wine unto this time. Of this, by putting seven parts of water to one of wine, we made some weak beverage; which (by reason that the wine, by being frozen, had lost his virtue) was little better than water. The sicker sort had a pint of *Alicant* a day, by itself; and of such poor *aqua vite* too, as we had, they had a little dram allowed them next their hearts every morning; and thus we made the best use of what we had, according to the seasons.

*May*, 1632.

The first of this month we went aboard betimes to heave out the ice.

The second it did snow and blow, and was so cold, that we were fain to keep house all day. This unexpected cold at this time of the year did so vex our sick men, that they grew worse and worse; we cannot now take them out of their beds, but they would swoon, and we had much ado to fetch life in them.

The third, those that were able went aboard betimes to heave out the ice. The snow

snow was now melted in many places upon the land, and flood in places; and now there came some cranes and geese to it.

The fourth, while the rest wrought aboard, I and the surgeon went with a couple of pieces, to see if we could kill any of these fowl for our sick men, but never did I see such wild-fowl, they would not incline to see any thing move. Wherefore we returned within two hours, not being able to endure any longer stalking thro' the snow, and the wet places. I verily thought that my feet and legs would have fallen off, they did so torment me with aching.

The sixth, *John Warden*, the master of my ship's chief mate, died; whom we buried in the evening (in the most christian-like manner we could) upon the top of a bare hill of sand, which we called *Brandon-Hill*.

The weather continued very cold; freezing so hard in a night, that it would bear a man.

By the ninth we were come to, and got up our five barrels of beef and pork, and had found four butts of beer, and one of cyder, which God had preserved for us. It had lain under water all the winter; yet we could not perceive that it was any thing the worse. God make us ever thankful for the comfort it gave us.

The tenth it did snow and blow so cold, that we could not stir out of the house; yet nevertheless by day the snow vanisheth away apace on the land.

The eleventh we were aboard betimes, to heave out ice.

The twelfth at night we had cleared out all the ice out of the hold, and found likewise our store-shoes, which had lain soak'd in the water all the winter; but we dried them by the fire, and fitted our selves with them. We struck again our cables into the hold. There stow'd we a butt of wine also, which had been all the winter on the upper-deck, and continued as yet all firm frozen. We fitted the ship also, making her ready to sink her again, when the ice brake up. We could hitherto find no defect in her, and therefore well hop'd that she was staunch. The carpenter, nevertheless, did earnestly argue to the contrary; alledging, that now she lay on the ground, in her dock; and that the ice had fill'd her defects; and that the ice was the thing that kept out the water; but when she should come to labour in the sea, then doubtless she would open. And indeed we could now see quite through her seams betwixt wind and water. But that which did trouble us as ill as all this, was the loss of her rudder; and that she now lay in the very strength of the tide, which, when-

ever the ice drove, might tear her to pieces. But we still hoped the best.

The thirteenth, being the sabbath-day, we solemniz'd, giving God thanks for those hopes and comforts we daily had; the weather by day-time was pretty warm, but it did freeze by night; yet now we could see some bare patches of land.

The fourteenth we began a new sort of work. The boatwain and a convenient number fought ashore the rest of our rigging, which was much spoiled by pecking of it out of the ice; and this they now fell to fittings, and to serving of it. I set the cooper to fit our cask, although (poor man) he was very infirm; my intent being to pass some cables under the ship, and so to baoy her up with these casks, if otherwise we could not get her off. Some others I ordered to go see if they could kill some wild-fowl for our sick men, who grew worse and worse. And this is to be remember'd, that we had no shot but what we did make of the aprons of our guns, and some old pewter that I had; for the carpenter's sheet-lead we durst not use.

The fifteenth I manured a little patch of ground, that was bare of snow, and sowed it with peason, hoping to have some of the herbs of them shortly to eat; for as yet we can find no green thing to comfort us.

The eighteenth our carpenter, *William Cole* died, a man generally bemoaned of us all, as much for his innate goodness, as for the present necessity we had of a man of his quality. He had endured a long sickness with much patience, and made a godly end. In the evening we buried him by *Mr. Warden*, accompanied with as many as could go; for three more of our principal men lay then expecting a good hour. And now were we in the most miserable estate that we were in all the voyage. Before his extreme weakness he had brought the pinnacle to that pass, that she was ready to be boulded and trennel'd, and to be joined together to receive the plank; so that we were not so discouraged by his death, but that we did hope of our selves to finish her, if the ship proved unserviceable.

This our pinnacle was 27 foot by the keel, 10 foot by the beam, and 5 foot in hold. She had 17 ground timbers, 34 principal saddles, and eight short saddles. He had contrived her with a round stern, to save labour; and indeed she was a well proportioned vessel. Her burthen was twelve or fourteen ton.

In the evening the master of our ship, after burial, returning aboard ship, and looking about her, discover'd some part of our gunner, under the gun-room ports. This

man we had committed to the sea at a good distance from the ship, and in deep water, near six months before.

The nineteenth in the morning I sent men to dig him out. He was fast in the ice, his head downward, and his heel upward, for he had but one leg, and the plaster was yet at his wound. In the afternoon they had digged him clear out; after all which time he was as free from noisomeness as when we first committed him to the sea. This alteration had the ice and water, and time only wrought on him, that his flesh would slip up and down upon his bones, like a glove on a man's hand. In the evening we buried him by the others. This day one *George Ugganes* (who could handle a tool best of us all) had indifferent well repaired our boat; and so we ended this mournful week. The snow was by this time prettily well wasted in the woods; and we having a high tree, on the highest place of the island, which we called our watch-tree, from the top of it we might see into the sea, but found no appearance of breaking up yet.

The twentieth, being *Whit-sunday*, we fastly solemnized, and had some taste of the wild-fowl, but not worth the writing.

The 21st was the warmest sun-shine day that came this year. I sent two a fowling; and my self taking the master, the surgeon, and one more, with our pieces and our dogs, we went into the woods to see what comfort we could find. We wandered from the house eight miles, and search'd with all diligence; but returned comfortless, not an herb nor leaf eatable, that we could find. Our fowlers had as bad success. In the woods we found the snow partly wasted away, so that it was passable. The ponds were almost unthaw'd; but the sea from any place we could see all firm frozen.

The snow doth not melt away here with the sun or rain, and so make any land-floods, as in *England*; but it is exhaled up by the sun, and suck'd full of holes, like honey-combs, so that the sand whereon it lies will not be at all wetted. The like observation we also had; that let it rain ever so much, you shall see no land-floods after it.

The 22d we went aboard the ship, and found that the had made so much water, that it was now risen above the ballast, which made us doubt again of her foundeness. We fell to pumping, and pump'd her quite dry. And now by day sometimes we have such hot glooms, that we cannot endure in the sun, and yet in the night it would freeze very hard. This unnaturalness of the season did torment our men, that they now grew worse and worse daily.

The 23d our boatswain (a painful man)

having been long sick, (which he had heartily relisted) was taken with such a painful ach in one of his thighs, that we verily thought he would have presently died. He kept his bed all day in great extremity; and it was a maxim amongst us, that if any one kept his bed two days, he could rise no more. This made every man to strive to keep up for life.

The 24th was very warm sun-shine, and the ice did consume by the shore's side, and crack'd all over the bay, with a fearful noise. About three in the afternoon, we could perceive the ice with the ebb to drive by the ship; whereupon I sent two with all speed unto the master to beat out the hole, and to sink the ship; as likewise to look for the rudder betwixt the ice. This he presently performed; and a happy fellow, one *David Hammon*, pecking betwixt the ice, struck upon it, and it came up with his lance; who crying that he had found it, the rest came and got it up on the ice, and so into the ship. In the mean space, with the little drift that the ice had, it began to rise and mount into high heaps against the shoal shores and rocks; and likewise against the heap of ice, which we had put for a barricado to our ship, but with little harm to us. Yet we were fain to cut away 20 fathom of cable, which was frozen in the ice. After an hour, the ice settled again, as not having any vent outwards. Oh! this was a joyful day to us all; and we gave God thanks for the hopes we had of it.

The 25th was a fine warm day, and with the ebb the ice did drive against the ship, and shake her shrewdly.

The 26th I took the surgeon with me, and went again to wander the woods; and went to that bay, where last year we had lost our man *John Barton*. But we could find no sign of him, nor of other relief.

By the 28th it was pretty clear betwixt the ship and the shore, and I hoped the ice would no more dangerously oppress us; wherefore I caused the lower hole to be firmly stopp'd, the water then remaining three foot above the ballast.

The 29th, being prince *Charles's* birthday, we kept holy-day, and display'd his majesty's colours both a-land and a-board, and named our habitation, *Charles-town*, by contraction *Cbarlton*; and the island, *Cbarlton-island*.

The 30th we launched our boat, and had intercourse sometimes betwixt the ship and the shore by boat, which was news to us.

The last of this month we found on the beach some vetches to appear out of the ground, which I made the men to pick up, and to boil for our sick men.

## Our Wintering at Winter's Forest.

This day we made an end of fitting all our rigging and sails; and it being a very hot day, we did dry and new make our fish in the sun, and aired all our other provisions. There was not a man of us at present able to eat of our salt provisions, but myself and the master of my ship. It may be here remember'd, that all this winter we had not been troubled with any rheums, nor flegmatical diseases. All this month the wind hath been variable, but for the most part northerly.

June, 1632.

The four first days it did snow, hail, and blow very hard; and was so cold, that the ponds of water did freeze over; and the water in our cans did freeze in the very house; our clothes also that had been washed, and hung out to dry, did not thaw all day.

The fifth it continued blowing very hard in the broad-side of the ship, which did make her swag and wallow in the dock for all she was funken, which did much shake her. The ice withal did drive against her, and gave her many fearful blows. I resolved to endeavour to hang the rudder; and when God sent us water (notwithstanding the abundance of ice that was yet about us) to have her farther off. In the afternoon we under-run our small cable to our anchor, which lay a-stern in deep water, and so with some difficulty gate up our anchor. This cable had lain slack under foot, and under the ice, all the winter, and we could never have a clear flatch from ice, to have it up before now; we found it not a jot the worse. I put some to make colrakes, that they might go into the water, and make a hole in the sands to let down our rudder.

The sixth we went about to hang it. And our young lustiest men took turns to go into the water, and to rake away the sand; but they were not able to endure the cold of it half a quarter of an hour it was so mortifying; yea, use what comforts we could, it would make them swoon and die away. We brought it to the stern-post, but were then fain to give it over, being able to work at it no longer. Then we plugg'd up the upper holes within board, and fell to pumping the water again out of her.

The seventh we wrought something about our rudder, but were again forced to give over, and to put out our cables over-board, with messengers unto them; the anchors lying to that pass, that we might keep her right in her dock, when we should have brought her light.

By the eighth at night we had pump'd

all the water out of her; and she at a high water would fleet in her dock, though she were still dock'd in the sands almost four foot. This made us to consider what was to be done. I resolved to heave out all the ballast, for that the bottom of her being so soak'd all the winter, I hoped was so heavy, that it would bear her. If we could not get her off that way, I then thought to cut her down to the lower deck, and take out her masts; and so with our cask to buoy her off.

The ninth betimes in the morning we fell to work. We hoisted out our beer and cyder, and made a raft of it, fastening it to our shore-anchor. The beer and cyder sunk presently to the ground, which was nothing strange to us; for that any wood or pipe-staves that had lain under the ice all the winter, would also sink down, so soon as ever it was heav'd over-board. This day we heav'd out ten tun of ballast. And here I am to remember God's goodness towards us in sending those forementioned green vetches; for now our feeble sick men, that could not for their lives stir these two or three months, can endure the air and walk about the house; our other sick men gather strength also, and it is wonderful to see how soon they were recovered. We used them in this manner: Twice a day we went to gather the herb or leaf of these vetches, as they first appeared out of the ground; then did we wash and boil them, and so with oil and vinegar that had been frozen, we did eat them. It was an excellent sustenance and refreshing; the most part of us eat nothing else. We would likewise bruise them, and take the juice of them, and mix that with our drink. We would eat them raw also with our bread.

The eleventh was very warm weather, and we did hang our rudder. The tides did now very much deceive us; for a northerly wind would very little raise the water. This made us doubt of getting off our ship.

The thirteenth I resolved of the latitude of this place; so that having examined the instruments, and practised about it this fortnight, I now found it to be in 52 deg. and 3 min.

The fourteenth we had heaved out all the ballast, and carried all our yards, and every thing else of weight ashore, so that we now had the ship as light as possible it could be.

The fifteenth we did little but exercise ourselves; seeing that by this time our men that were most feeble, are now grown strong, and can run about. The flesh of their gums became firtled again, and their teeth fasten'd; so that they can eat beef with their vetches.

This day I went to our watch-tree; but the sea (for any thing I could perceive to the contrary) was still firm frozen; and the bay we were in, all full of ice, having no way to vent it.

The sixteenth was wondrous hot, with some thunder and lightning, so that our men did go into the ponds ashore to swim and cool themselves; yet was the water very cold still. Here had lately appeared divers sorts of flies; as butter-flies, butchers-flies, horse-flies, and such an infinite abundance of blood-thirsty muscatoes, that we were more tormented with them than ever we were with the cold weather. These (I think) lie dead in the old rotten wood all the winter, and in the summer they revive again. Here be likewise infinite company of ants, and frogs in the ponds upon the land; but we durst not eat of them, they look'd so speckled like toads. By this time were neither bears, foxes, nor fowl to be seen; they are all gone.

The seventeenth the wind came northerly, and we expecting a high tide in the morning betimes, put out our small cable astern out at the gun-room-port; but the morning tide we had not water by a foot. In the evening I had laid marks, by stones, &c. and methoughts the water did flow apace. Making signs therefore for the boat to come ashore, I took all that were able to do any thing with me aboard; and at high-water (altho' he wanted something to rise clear out of her dock) yet we heav'd with such a good-will, that we heav'd her thro' the sand into a foot and a half deeper water. Further then so, we durst not yet bring her, for that the ice was all thick about us. After we had moor'd her, we went all to prayers; and gave God thanks that had given us our ship again.

The eighteenth we were up betimes; the cooper, and some with him, to fill fresh water; myself with some others to gather stones at low water; which we piling up in a heap, at high water the cockswain and his gang fetch'd them aboard; where the master with the rest stowed them. The ship at low water had a great lust to the offing; by which means we could the better come and stop the two upper holes firmly; after which we fitted other convenient places, to make others to sink here, if occasion were.

The nineteenth we were all up betimes to work, as afore specified. These two days our ship did not fleet, and it was a happy hour when we got her off, for that we never had such a high tide all the time we were here. In the evening I went up to our watch-tree; and this was the first time I could see any open water any way, except that little by the shore-side, where we

were. This put us in some comfort, that the sea would shortly break up, which we knew must be to the northward, seeing that way we were certain, there was above two hundred leagues of sea.

The twentieth we laboured as afore said. The wind at N. N. W. The tide rose so high, that our ship flected, and we drew her further off, into a foot and a half deep water. Thus we did it by little and little, for that the ice was still wonderful thick about us.

The 22d there drove much ice about us, and within us, and brought home our stern anchor. At high water (notwithstanding all the ice) we heav'd our ship further off; that so she might lie a-float at low water.

The next low water we founded all about the ship, and found it very foul ground; we discovered stones three foot high above the ground, and two of them within a ship's breadth of the ship, whereby did more manifestly appear God's mercies to us; for if when we forced her ashore, she had stricken one blow against those stones, it had bulged her. Many such dangers were there in this bay, which we now first perceived, by the ice's grounding and rising against them. In the evening we tow'd off the ship unto the place where she rid the last year, and there moor'd her, sheering the ship night and day, flood and ebb, amongst the dispers'd ice that came athwart of us.

The 23d we laboured in fetching our provisions aboard; which to do we were fain to wade to carry it to the boat a full flight shot, and all by reason the wind was southerly. This morning, I took an observation of the moon's coming to the south, by a meridian-line of one hundred and twenty yards long, which I had rectified many weeks before-hand.

The 24th I took another observation of the moon's coming to the meridian; for which I refer you to the observations in the latter end of this journal.

Whereas I had formerly cut down a very high tree, and made a cross of it, to it I now fastened (uppermost) the king's and queen's majesties pictures drawn to the life, and doubly wrapt in lead, and so close, that no weather could hurt them. Berwix both these I affixed his majesty's royal titles; viz. *Charles the first, king of England, Scotland, France, and Ireland; as also of Newfoundland, and of these territories; and to the westward as far as Nova Albion; and to the northward, to the latitude of 80 degrees, &c.*

On the out-side of the lead, I fasten'd a shilling and a six-pence of his majesty's coin; under that we fasten'd the king's arms fairly cut in lead, and under that the arms of the city of Bristol. And this being *Midsummer-Day*,

summer-day, we raised it on the top of the bare hill, where we had buried our dead fellows; formally by this ceremony taking possession of these territories to his majesty's use.

The wind continuing southerly, and blowing hard, put all the ice upon us; so that the ship now rid amongst it, in such apparent danger, that I thought verily we should have lost her. We labour'd, flood and ebb, both with poles and oars, to heave away and part the ice from her. But it was God that did protect and preserve us; for it was past any man's understanding, how the ship could endure it, or we by our labour save her. In the night the wind shifted to the westward, and blew the ice from us, whereby we had some rest.

The 25th in the morning, the boatwain, with a convenient crew with him, began to rig the ship, the rest fetching our provisions aboard. About ten a-clock, when it was something dark, I took a lance in my hand, and one with me with a musket and some fire, and went to our *watch-tree*, to make a fire on the eminentest place of the island, to see if it would be answer'd. Such fires I had formerly made, to have knowledge if there were any savages on the main or the islands about us. Had there been any, my purpose was to have gone to them, to get some intelligence of some christians, or some ocean sea thereabouts. When I was come to the tree, I laid down my lance, and so did my comfort his musket; and whilst my self climbed up to the top of the tree, I ordered him to put fire unto some low tree thereabouts. He (unadvisedly) put fire to some trees that were to windward; so that they (and all the rest too, by reason it had been very hot weather) being fear and dry, took fire like flax or hemp; and the wind blowing the fire towards me, I made haste down the tree. But before I was half way down, the fire took in the bottom of it, and blazed so fiercely upwards, that I was fain to leap off the tree, and down a steep hill, and in brief, with much ado, escap'd burning. The moss on the ground was as dry as flax; and it would run most strangely, and like a train along the earth. The musket and the lance were both burnt. My comfort at last came to me, and was joyful to see me; for he thought verily I had been burned. And thus we went homeward together, leaving the fire increasing, and still burning most furiously. We could see no answer of it. I slept but little all night after; and at break of day I made all our powder and beef to be carried aboard. This day I went to the hills to look to the fire; where I saw how it did still burn most furiously, both to the west-

ward and northward: leaving one upon the hills to watch it, I came home immediately, and made them take down our new suit of sails, and carry them to the seaside, ready to be cast in, if occasion were, and to make haste to take down our houses. About noon the wind shifted northerly; and our centinel came running home, bringing us word, that the fire did follow him hard at his heels, like a train of powder. It was no need to bid us take down and carry all away to the sea-side. The fire came towards us with a most terrible rattling noise, bearing a full mile in breadth; and by that time we had uncovered our houses; and laid hand on, to carry away our last things, the fire was come to our town, and seized on it, and (in a trice) burnt it down to the ground. We lost nothing of any value in it; for we had brought it all away into a place of security. Our dogs in this combustion would sit down on their tails, and howl, and then run into the sea, on the shoals, and there stay. The wind shifted easterly; and the fire ranged to the westward, seeking what it might devour. This night we lay all together aboard the ship, and gave God thanks that he had shipt us in her again.

The 27th, 28th, and 29th, we wrought hard in fetching our things aboard, as likewise our water, which we must tow off with the ebb, and bring it to the ship with the flood. Moreover, we must go about the easter-point for drift-wood; for our tools were all so spent, that we could cut none. Wherefore, about some three days ago I had caused our pinnacle to be sawed to pieces, and with that we stowed our cask, intending to burn it at low waters, and such other times as we could not work in carrying things aboard. I employed the men in fetching stones; and we did build three tombs over our three dead fellows, filling them up with sand in a decent and handsome fashion. The least tomb had two tons of stones about it.

The 30th we most earnestly continued our labour, and brought our sails to yard; and by eleven a-clock at night had made a priddy ship; meaning to have finished our business with the week and the month, that so we might the better solemnize the sabbath ashore to-morrow, and so take leave of our wintering island.

The wind hath been variable a great while, and the bays are now so clear of ice, that we cannot see a piece of it, for it was all gone to the northward. Hoping therefore that it give content to some readers, I will relate the manner of the breaking of it up. It is first to be noted, that it doth not freeze (naturally) above six foot, the rest is by accident. Such is that

that ice that you may see here, six fathom thick. This we had manifest proof of, by digging the ice out of the ship, and by digging to our anchors before the ice broke up.

In May, when the heat increaseth, it thaws first on the shoal by the shore side; which when it hath done round about, then the courtes of the tides (as well by the ebb and flood, as by their rising and falling) do so shake the main ice, that it cracks and breaks it. Thus, when it hath gotten room for motion, then runs one piece of it upon another; and so bruises and grinds it self against the shoals and rocks, that it becomes abbreviated, inasmuch that a ship may have well passage through it. Besides this, much of it is thrust upon the shoals, where it is much consumed by the heat of the sun. The season here in this climate is most unnatural; for in the day-time it will be extreme hot, yet, not indurable in the sun, which is, by reason that it is a sandy country. In the night again it will freeze an inch thick in the ponds, and in the tub about and in our house; and all this towards the latter end of June.

The muscatoes, upon our coming away, were most intolerable. We tore an old ancient in pieces, and made us bags of it to put our heads in; but it was no fortification against them. They would find ways and means to sting us, that our faces were swollen hard out in pimples, which would so itch and smart, that we must needs rub and tear them. And these flies, indeed, were more tormenting to us than all the cold we had heretofore endured.

July, 1632.

The first of this month, being Sunday, we were up betimes. And I caused our ship to be adorned the best we could; our antient on the poop, and the king's colours in the main-top. I had provided a short brief of all the passages of our voyage to this day: I likewise wrote in what state we were at present, and how I did intend to prosecute the discovery, both to the westward, and to the southward, about this island. This brief discourse I had concluded, with a request to any noble minded traveller, that should take it down, or come to the notice of it; that if we should perish in the action, then to make our endeavours known to our sovereign lord the king. And thus with our arms, drum and colours, cook and kettle, we went ashore, and first we marched up to our eminent cross, adjoining to which we had buried our dead fellows. There we read morning prayer, and then

VOL. II.

walked up and down till dinner-time. After dinner we walked to the highest hills, to see which way the fire had waited. We desired that it had consumed to the westward sixteen miles at least, and the whole breadth of the island. Near about our cross and dead it could not come, by reason it was a bare sandy hill. After evening prayer I happened to walk along the beach-side; where I found an herb resembling scurvy-grass. I made some to be gathered, which we boiled with our meat to supper. It was most excellent good, and far better than our vetches. After supper we went all to seek and gather more of it; which we did to the quantity of two bushels, which did afterwards much refresh us. And now the sun was set, and the boat come ashore for us; whereupon we assembled our selves together, and went up to take the last view of our dead, and to look unto their tombs, and other things. Here leaning upon mine arm, on one of their tombs, I uttered these lines, which though perchance they may procure laughter in the wiser sort (which I shall be glad of) they yet moved my young and tender-hearted companions at that time with some compassion. And these they were:

*I were unkind, unless that I did speed,  
Before I part, some tears upon our dead;  
And when my eyes be dry, I will not cease  
In heart to pray, their bones may rest in  
peace:  
Their better parts (good souls) I know were  
given,  
With an intent they should return to heaven.  
Their lives they spent, to the last drop of  
blood,  
Seeking God's glory, and their country's  
good;  
And as a valiant soldier, rather dies,  
Than yields his courage to his enemies;  
And stops their way, with his beav'd flesh,  
When death  
Hath quite depriv'd him of his strength and  
breath:  
So have they spent themselves, and here they  
lie  
A famous mark of our discovery.  
We that survive, perchance may end our  
days  
In some employment meriting no praise:  
And in a dungbil rot; when no man names  
The memory of us, but to our shames,  
They have out-liv'd this fear, and their brave  
ends,  
Will ever be an honour to their friends.  
Why drop you so, mine eyes? Nay rather  
pour  
My sad departure in a solemn shower.*

The

## Our Wintering at Winter's Forest.

*The winter's cold, that lately froze our blood,  
Now were it so extreme, might do this good,  
As make these tears, bright pearls: which I would lay,  
Tomb'd safely with you, till doom's fatal day.  
That in this solitary place, where none  
Will ever come to breathe a sigh or groan,  
Some remnants might be extant, of the true  
And faithful love I ever tender'd you.  
Oh, rest in peace, dear friends, and let it be  
No pride to say the sometime part of me.  
What pain and anguish doth afflict the dead,  
The heart and stomach, when the limbs are dead;  
So griev'd, I kiss your graves, and vow to die  
A foster-father to your memory.*

FAREWEL.

So fastening my brief to the cross, which was securely wrapt up in lead, we presently took boat and departed, and never

put foot more on that island.

This island and all the rest (as likewise the main) is a light white sand, covered over with a white moss, and full of shrubs and low bushes; excepting some bare hills, and other patches. In these bare places the sand will drive with the wind like dust. It is very full of trees, as spruce and juniper; but the biggest tree I saw was but a foot and a half over. At our first coming hither, we saw some deer, and kill'd one, but never any since. Foxes all the winter we saw many, and kill'd some dozen of them; but they went all away in May. Bears we saw but few, but kill'd none. We saw some other little beasts. In May there came some fowl, as ducks and geese; of which we kill'd very few. White partridges we saw, but in small quantities; nor had we any shot to shoot at them. Fish we could never see any in the sea; nor no bones of fish on the shore side, excepting a few cockle-shells, and yet nothing in them neither. Other things remarkable I have before mentioned.

Coming Home.

July 1632.

**M**onday being the 2d of July, we were up betimes, about stowing and fitting our ship and weighing of our anchors, which when the last was a-trip, we went to prayer, beseeching God to continue his mercies to us, and rendering him thanks for having thus restored us. Our ship we found no defect in; we had abundance of such provisions as we brought out of *England*, and we were in indifferent health, and did gather strength daily. This being done, we weighed and came cheerfully to sail: The wind at N.W. bad to get away; wherefore we stood over to *Danby* island, to take in more wood, and there to be ready to take the opportunity of a fair wind. I went ashore my self with the boat; for that some of the company had told me, that they had seen stakes the last year droven into the ground. When we came ashore, whilst some gathered wood, I went to the place, where I found two stakes droven into the ground about a foot and a half, and firebrands, where a fire had been made by them. I pull'd up the stakes, which were about the bigness of my arm; and they had been cut sharp at the ends with a hatchet, or some other good iron tool, and driven in as it were with the head of it. They were distant about a stone's throw from the water-side. I could not conceive to what purpose they should be there set, unless it were for some mark for boats. This did augment my desire to speak with the savages; for without doubt they could have given notice of some christians with whom they had some commerce. About four in the evening I returned aboard with a boat's lading of wood, and the wind something favouring we weighed, with our lead seeking out a channel amongst these perilous shoals. In the evening the wind opposing it self, we came to anchor betwixt *Charleton* island, and that island we named the last year, (in memory of that honourable gentleman, Mr. *Thomas Carie*, one of the bed-chamber to the king) *Carie's* island, where we rid all night.

The 3d at break of day, we weighed with a bare wind, and founding up and down for a channel, we were many times in five and four fathom water. The wind larging upon us, we stood away west: By noon we saw all ice to the northward of us; endeavouring therefore to compass about the western point of *Charleton* island, and so to seek to the southward, we found it all shoals, rocks and braches. By four in the afternoon we saw the western land, but all full of ice; whereupon as the wind favoured us, we stood along it in sight to the northward.

The 4th was calm, but so very thick fog with all, that we could not see a pistol-shot about us: Wherefore we came to an anchor, and there rid all this day and the next night.

The 5th at three in the morning we weighed; but ice being all about us, we knew not which way to turn us: Now to avoid telling the same thing twenty times, we were continually, 'till the 22d, so pestered and tormented with ice, that it would seem incredible to relate it: Some we were so blinded with fog, that we could not see about us; and being now become wilful in our endeavours, we should so strike against the ice, that the forepart of the ship would crack again, and make our cook and others to run up all amazed, and think the ship had been beaten all to pieces. Indeed we did hourly strike such unavoidable blows, that we did leave the hatches open, and twenty times in a day the men would run down into the hold, to see if she were bulged.

Sometimes when we had made her fast in the night, to a great piece of ice, we should have such violent storms, that our fastning would break, and then the storm would beat us from piece to piece most fearfully; otherwhile we should be fast inclosed among great ice as high as our poop. This was made (as I have formerly said) by one piece running upon another, which made it draw eight or ten fathom water.

Best

Besides which, the lowermost would rise from underneath, and strike us under the bulge, with pieces of five, six, yea of eight ton, that many times we have pump'd clear water for an hour together, before we could make the pump suck. Amongst these several and hourly dangers, I overheard the men murmur and say, that they were happy that I had buried; and that if they had a thousand pounds they would give it, so they lay fairly by them; for we (say they) are destined to starve upon a piece of ice. I was fain to endure all this with patience, and to comfort them up again, when I had them in a better humour.

The 22d having been vext with a storm all last night, and this morning with a thick fog, we drove in thirteen fathom water. About noon it cleared, and we saw land, and at the instant had a good observation, whereby we knew it to be cape *Henrietta Maria*. I made the master stand in with it, and in the mean time we fitted a cross, and fastened the king's arms and the arms of the city of *Bristol* to it; we came to an anchor within a mile of the shore, in six fathom water; so we hoisted out the boat, and took our arms and our dogs, and went ashore. Upon the most eminent place we erected the cross, and then seeking about, we soon saw some deer, and by and by more and more: We stole to them with the best skill we had, and then put our dogs on them, but the deer ran clear away from them at their pleasure. We tired the dogs and wearied ourselves, but to no purpose, neither could we come to shoot at them. I saw in all about a dozen (old and young) very goodly beasts. We took half a dozen young geese on the pools, by wading in to them; and so returned to our boat vext, that now we had found a place where there was refreshing, and we could get none of it: Whereas therefore we had kept our dogs with a great deal of inconvenience aboard the ship all the winter, and had pardoned them many misdemeanors, (for they would steal our meat out of the sleeping tubs) in hope they might hereafter do us some service; and seeing they now did not, and that there was no hope they could hereafter, I caused them to be left ashore. They were a dog and a bitch; buck-dogs of a very good race. The dog had a collar about his neck, which it may be hereafter may come to light. I did see no sign at all of any salvages, nor could we find any herbs or other refreshing here.

In the evening, (being returned aboard) and the wind blowing fair at fourth, I caused the master to weigh and come to sail, and to

lose no time, for we did hope for an open sea to the N. W. This cape hath a very shoald point that lies off it, which we endeavoured to compass about.

Sailing therefore amongst shattered ice, we came to very shoald water, (four and five fathom deep) and could not avoid it. At length standing N. the water deepened, but we came amongst great pieces of ice; which by reason of some open water, there went a pretty sea. These hard pieces of ice made a most fearful noise. It proved a fair moon-shine night, otherwise it had gone ill with us. We turned amongst this ice, staying the ship sometimes within her length of great pieces, as bad as rocks; but by reason we were often forced to bear up, we did sag upon the main rand of ice, and that we thought would be worse for us, we let fall an anchor, and stood all on the decks to watch the ice's sheering of the ship (to and again) to avoid it. Thus having poles and oars to fend it, we could not keep our selves so clear, but many pieces came foul of us. We brake two of our great poles with it, which were made to be handled by four men, besides some other damages. At break of day we weighed, and sought all ways to clear ourselves of ice, but it was impossible. I conceive it impertinent to relate every particular days passages, which was much alike to us. Our endeavours were sometimes with our sails, giving and receiving 500 fearful blows in a day. Sometimes we would stop at an anchor, when we could get a little open water, and so suffer the ice to drive to leeward; other whiles we should be enclosed amongst it, and then it would so break and rise, and leap up under us, that we expected to be beaten every hour to pieces.

Moreover, we should have such storms in the dark nights, that would break the mooring we had made fast to some piece of ice for security in the night season; and then we should beat most dangerously from piece to piece till day-light, that we could see to make her fast again. I forbear to speak of thick fogs which we had daily, which did freeze our rigging day and night; besides all which, we should come into most uncertain depths, sometimes twenty fathom, next cast ten, next fifteen, then nine, rocky foul ground. The great deep ice withal, driving on these uncertain depths, did so distract the tides, and deceive us so much in our accounts, that by the 30th we were driven back so far to the eastward, and to the southward of the cape, that at five a clock in the evening it bare N. W. of us some three leagues off, contrary to our expectations. With

all these mischiefs our ship is now become very leaky, that we must pump every half watch. Here I called a consultation; and after consideration of all our experience, we were all of the same opinion, that it was impossible to get to the northward, or to the eastward, by reason of the ice; wherefore I resolved upon this course; when the wind blew south, it would blow the ice off the south shore, then we would seek to get to the westward, betwixt it and the shore. I must confess, that this was a desperate resolution, for all the coast we knew to be shoal and foul ground, all rocks and stones; so that if the wind should shift to the northward, there would be (without God's mercies) little hope of us. But here we must not stay; the nights grew long, the cold so increased, that betwixt the pieces of ice, the sea would be frozen. I caused the ship to be fitted, and places convenient again prepared to sink her the second time, if so be we were put to extremities. We presently put our project in execution (the wind being at south) and got about the shoals of the cape, standing then into the shoreward, to get betwixt it and the ice, we came into four fathom water (very foul rocky ground) thinking to come to an anchor all night, and let the ice drive to leeward. But still there was so much ice betwixt us and the shore, that we were fain to bear up amongst it into deeper water, and to let the ship drive amongst it. The wind increasing, we endured a most dangerous dark night of it. In the morning we fell to work to get the ship again out of the ice into some clear water, which we saw W. by S. of us. Some of our company went out upon the ice, to heave her with their shoulders, whilst others stood aboard with poles; the rest stood to spill and fill the sail. By nine in the morning we had gotten into some clear water, and stood west and by south, and into four fathom water foul ground. But being not able to weather some rands of ice which did drive, we were fain to stand off again, and (when the evening grew dark) to come to an anchor.

About midnight there came a great piece of ice (which we could not avoid) athwart of our cable, and made the ship drive and drag her anchor. This drove her into shoal water, it being very rocky and foul ground. We brought the cable to capstan, and heav'd with such a courage, that we heaved home our anchor from under it. Thus we did endeavour (the best we could) to keep our selves in eight and ten fathom water. It then pleased God that the wind blew along the shore, otherwife it had gone far worse with us.

VOL. II.

August 1632.

The first of this month at break of day, when we could see a little about us, we fell to struggle and strive again with the ice, and to get in nearer to the shore. There by reason the wind was opposite to come to an anchor, we let the ice drive to leeward, hoping that there was a clear sea to the westward. The ice drove very thick upon us, and one piece came foul of us, which did touch our spritsail-yard, and made the ship drive, but we soon clear'd ourselves of it. Then we weigh'd and stood in nearer to the shore, but the water shoalded, and there were so many great rands of ice betwixt us and the shore, that there was no coming to an anchor: So we turned betwixt the ice, many pieces of it being a-ground in shoal water, and few pieces distant one from the other a cables length. This day we saw two sea-morses on the ice.

The 2d in the morning we were glad of the break of day, having most dangerously turned amongst the ice all night, and endured many a heavy blow. We stood in again to the shoreward, to see if we could get some clear water; for to the northward it was all impassable ice. We stood into five and four fathom, but still all incompast with ice; so we stood off again into deeper water, and in the evening we were inclosed amongst extraordinary great pieces; it was a very thick fog withal, so that we made fast the ship to a great flat piece, and went to sleep and refresh ourselves after our extreme pains-taking.

The 3d, 4th and 5th we were inclosed amongst very great ice, and it blew such a storm of wind, that we sometimes endeavoured to get forward to the westward, did strike such heavy blows, that made all the forepart of the ship crack again: Then we would give over working, and let her alone amongst it; but then the ice would break and rise under us, that would endanger us as bad as the former. Our ship doth make above a ton of water every watch, which we must pump out, beside our other labour. God think on us, and be merciful to us amongst all these dangers.

The 5th at noon we were in latitude 55. 30. the cape bearing off us S. E. by E. some twelve leagues off; and this is all we have gotten since the 22d of July. All night it blew a violent gale of wind at W. N. W. and about midnight our hawker (which we had made fast to a piece of ice) broke, and we lost fourteen fathom of it. We beat all night most fearfully, being tost from piece to piece, because that in the dark we durst not venture our men to go forth on the ice for fear of losing them.

All the 6th the storm indured and drove us again with the ice, almost to the cape.

6 D

The

The 7th was the most comfortable day we had since we came out of our wintering-place; the wind came up fair at east, and we got (although with our former inconveniences and dangers) nearer to the shore, and into some open water, making good way to the westward. Moreover, our leak now stopt of its own accord, so that now we pump't but little. We sailed all night, keeping good watch on the fore-castle, bearing up for one, and loofing for another.

Thus did we the 8th also, but then the wind shifting to the N. W. it drove the ice on the shore, and we came to an anchor in eight fathom water. The main ice we had some two mile to windward of us, but the set of the tide kept it off from us. At noon we were in latitude 55. 34. In the evening a range of ice drove upon us, which made us weigh and stand in nearer the shore, about 12 fathom, and there to come to an anchor. The wind increasing about midnight, the ship did drive, and was quickly in five fathom water; wherefore we let fall our shoot-anchor, and both held her. But that that troubled us was, that we expected every minute, when the main ice would come upon us, and then there would be no hope but to be put ashore.

The 9th in the morning we weighed our second anchor, the ice being within less than a mile of us. About eight in the morning a point of it came foul of us, which we prevented by weighing, and came to an anchor in three fathom and a half water. The wind continued N. N. W. which was in on the shore. This morning I caused all our empty cask to be filled with water, and the ship to be left unpumpt, and the places look't to that we had prepared to sink her; for we were at present in as apparent danger as any time this voyage, and (to our great griefs) it was all foul rocky ground: The danger of this was, if we made fast to a piece of ice that drew deep water, then as soon as it came to ground on these rocks, it would break all to pieces, and betray us to our destruction. About noon there came foul of us the point of a range of ice, which we resolv'd to endure the extremity of with an anchor, thinking to ride and break through it, we now perceiving some open water beyond it; thrusting therefore and fending with our poles, at last a great piece came thwart our hawser, and there went a pretty sea amongst it. The ship did now fall upon it so violently, that I expected every blow she would beat out her bows. At length she did drive with it, so that I thought the cable had been broken. We brought it to capstan to heave it in, but found that our shoot-anchor was broken

in the middle of the shank. We presently set our sails thereupon, endeavouring that way to edge in amongst the ice off of this perilous shore. It pleased God to favour our labour so, that by eight in the evening we got off into seven fathom; and a dark night coming on, we made fast to the biggest piece we could find. It blew fairly all night, but about midnight the wind came up at north, which was more on the shore than before.

By break of day on the 10th we were driven into four fathom, very foul ground, so that the lead did fall off the rocks three or four foot; we set our sails, and used our uttermost endeavours to edge off. Some of us went upon the ice to hale her; others stood with poles to thrust by night. At night we had gotten off into eight fathom, and made fast to the biggest piece we could find. If any man should ask why we now kept so near to the shore, in this continual danger? I answer, Because that in the offing the ice was so extraordinary thick, that we could make no way, any way through it. Moreover, when we were in that great thick ice, and that the wind came up fair at S. or S. E. or E. we could not get out of it. Wherefore we chose to run this adventure, and so prevent and overcome all dangers with God's assistance and our extreme labour.

The 11th in the morning was a thick fog, yet there sprung up a gale of wind at east, and we made in for the shore.

From the 11th till the 14th the wind continued fair, and we made all the sail we could (night and day) as the ice would suffer us. We had the shore in sight by day on one side, and the ice within two miles on the other, and we sail'd amongst disperst pieces, luffing for one, and bearing up for another.

The 14th at noon we were in latitude 57. 55. In the evening we were imbayed in ice, and stood S. W. to clear ourselves of it, but could not. But seeing from topmast-head clear water over it, we put into it; but there rose a very thick fog, and night came on withal, that we were fain to fasten to a piece of ice, expecting day and better weather.

The 15th in the morning (although the fog was very thick) we endeavour'd to get out of the ice, and stood away west; but within two hours the water shoalded from forty fathom to twenty five, whereby we knew that we had the shoalding of the western shore. Then we shaped our course to the northward, the fog continued so thick, that we could not see a pistol-shot about us. We had not stood this way two hours, but we heard the rut of the

the ice a-head of us, which made the most hideous noise of any we had heard this voyage. We halloed our tacks aboard, and stood to the westward in this day, hearing of it sometimes, and sometimes seeing of it, which was very large, deep and high ice above the water. We weathered it all, except some few pieces, and got into open water. About sunset there came a sudden gust N. N. W. and before we could handle our sails, it was with us, and put us to some trouble. It dallied with us by gusts till nine a clock, and then it fell into a most violent storm. We considered where we might have the clearest drift, and so took in all and let her drive her head to the shoreward. Before midnight the water shoalded on us to fifteen fathom. Then we turned her head to the eastward, and set our main-course low set, but as much as she could indure. The water deepen'd but little, and we knew that we were on those rocky shoalds which we struck on the last year; God be merciful to us. Here was the first great breaking sea that we had this year.

The 16th in the morning we were driven to a great rand of ice; to avoid which we set our fore course to, and stood to the shoreward in 13 fathom water, and then about again: We stood in a mile into the ice; but there went such a great swelling sea in it, that it was indurable, so we stood out again. About three a clock in the afternoon the storm broke up, and blew fair at N. W. which proved good for us, for we had not drift for four hours; besides, it was but two leagues betwixt the shoalds and the ice. We set all our sails and endeavoured to weather the ice, but in the evening we were still pester'd with it. By midnight we knew not which way to turn, nor what to do; so we took in all our sails, and let her drive amongst it. The ice beat us on every side, for there went amongst it a very great full sea.

The 17th in the morning, when we could see about us, we were in the midst of the ice; but with the last storm it was all broken into mammoicks, as big as a boat of three or four tons, which did give us many a heavy blow in the dark night. If this storm had taken us amongst it, it had beaten us all to pieces, without God's miraculous preservation. We made sail and endeavoured to clear ourselves of it to the northward, which by eight in the morning we had done.

We then went to prayer, and gave God thanks that had delivered us out of it. For we were hourly, for the space of six weeks, as it were in the jaws of death; yea, never any (that I have heard of) have been so

long in such long nights upon a foul shoald shore, tormented with ice, as we have now been. At noon we were in latitude 58. 20.

Now as touching the dissolution or ruin of the ice, we found that this storm had torn and shattered this rand of ice, which was on the outside, although it must have a long time to work into the main body of it. I have in July, and in the beginning of August, taken some of the ice into the ship, and cut it square two foot, and put it into the boat, where the sun did shine on it with a very strong reflex about it: And notwithstanding the warmth of the ship (for we kept a good fire) and all our breathings and motions, it would not melt in eight or ten days.

It was our practice, when we should be two days together fast to a piece of ice, to set marks on it, to see how it did consume, but it yielded us small hope of dissolving. We could not in that time perceive any diminution by the sinking of it or otherwise. Nevertheless, I think that it is ruined with storms, or consumed with heat some years, or else the bay would be filled choke-full; but I think that these secrets of nature are beyond our apprehension.

Being out of it, (but no otherways than that we yet saw it from off the decks, all to the eastward) I ordered the master to steer away north and by east, keeping the shoalding of the western shore.

The 18th at noon we were in latitude 59. 30.

The 19th we continued our course betwixt N. N. E. and the N. by E. and at noon were in latitude 61. 7. some 12 leagues off the shore. I ordered the master to shape his course north east, to look to that place betwixt *Carie's Swans-nest* and *Ne ultra*.

The 20th we were in latitude 61. 45. This day we saw some few seals about the ship.

The 21st the water shoalded so that we made account we did approach the land; but about noon the wind came up at N. E. our direct opposite. We looft as near it as we could, and as it larg'd we came to stand E. and E. and by N.

The 22d we fell with the land to the westward of *Carie's Swan's-Nest*, where we had forty fathom three leagues off. We stood in within a league of the shore, into thirteen fathom; and seeing the land to the southward of us, we compass about it, it being *Carie's Swan's-Nest*, which is in latitude 52. 00.

All the 23d we sailed N. E. and for the most part in sight of land.

The

The 24th at noon, (by judgment) we were in latitude 63. 30. having fail'd a N. E. course. All this day was a very thick fog, which about one a clock clear'd a little, so that I expected to see the land. Some of our men being better sighted, spied it out about some two leagues off from us. I knew it could be no other than *Nottingham* island, though it were something contrary to the expectation of our best mariners. We stood into it to make it. It was the north end of it, and it bare off us due east; I was soon assured of it, and I ordered the master to shape his course N. W. and by N. Both he and others were unwilling, but without much ado submitted themselves, (how loth soever) for that it was so very foul thick weather. The reasons of my resolution were these; the time of the year was far spent, and the discommodities of winter came upon us, and therefore would I make the shortest way, betwixt the lands already discovered. If I found an open sea, I had my desire, and did then intend to proceed to the utmost of our power; if we met with the land, I should then finish the discovery, it being not passing fifteen leagues from land to land, and not passing ten leagues from *Nottingham* island to the main of the north shore. We made what sail we could, it blowing a very stiff gale of wind until eight in the evening; then it began to blow fiercely, and we took in our top-sails, and stood under our two courses and bonnets. At nine it blew a violent storm at S. S. E. so that we took in our fore-sail, and let her drive N. W. All the night it continued an extraordinary storm; so that we heaved the lead every half watch; but the ship did drive so fast, that she would be paid the lead before there was twenty fathom of line out, all the night being exceeding cold withal.

The 25th the storm continued in his utmost malice, and did so perplex us, that there were but few that did sleep or eat a bit these 24 hours. About six a clock in the afternoon the storm began to slacken, yet blew there a fierce gale of wind betwixt the S. and S. W. We stood W. N. W. and made a N. W. way, when suddenly the sea became very smooth. We reasoned thereupon amongst ourselves, what might be the cause of it. We all thought it to be the leeward tide, nothing doubting what afterwards we encountered. The ship had very quick way in this smooth water.

The 26th by two a clock in the morning, we were suddenly come in amongst the ice; and it pleased God that the moon at the instant gave us so much light, that

we could see a little about us. We would have staid the ship, but it was so thick to windward, and so near us, that we durst not. We then bore up in this unexpected accident; and (I verily believe) did not escape striking the length of a foot against the ice as hard as rocks, two or three times; the ship now having way, after twelve leagues a watch. Then we stood close by a wind to the eastward, expecting day, that we might see about us: We could from top-mast-head see the ice to N. N. W. the N. W. and so round about by the S. to the E. and some there was to leeward of us. It was all flat sound ice, in main rands, and the sea as smooth as a well amongst it. This struck us all into a dump, whereupon I called a consultation of my associates; namely, *Arthur Price* master, *William Clemens* lieutenant, *John Whittered* master's mate, *Nathaniel Bilson* surgeon, and *John Palmer* boatswain, requiring them to advise and counsel me, how to prosecute our business to effect. These all went together, and reasoned amongst themselves, and then brought me their opinions in writing under their hands, viz. Our advice is, That you repair homeward from this present 26th, and that for these reasons:

First, For that the nights are long and so extreme cold withal, that we can hardly handle our sails and riggings. Secondly, The times are now subject to stormy and gusty weather, as witnesseth the present season, it having continued a storm ever since the 24th, and doth yet continue no weather to discover in. Thirdly, we doubt whether *Hudson's Streights* be so clear of ice, that it may be passable in convenient time, (winter coming now on apace) before we be frozen up, seeing the ice lies here all over the seas in rands and ranges. Fourthly, We must have a set of fair weather to pass the straight, which we may stay a long time for, if we neglect the first opportunity. Fifthly, For that our ship is very leaky, so that in foul weather we are fain to pump every glass, which is great labour. Moreover we know her to be so forely bruised with rocks and blows of the ice, that she is no more to be adventured amongst it, but in saving of our lives homewards. Besides all this, our men grow very weak and sickly, with extreme labour. Sixthly, the season of the year is so far spent, that we can expect no other weather than we have had, both lately and at present; that is to say, snow and fog freezing our rigging, and making every thing so slippery, that a man can scarce stand; and all this with the wind southerly, which if it should come to the northward,

ward, then we are to expect far worse. Seventhly and lastly, that the ice lies all in thick rands and ranges, in the very way we should go, as you and all men here may see. And therefore we conclude as aforesaid, that there is no possibility of proceeding farther; wherefore we here counsel you to return homeward, hoping that God will give us a favourable passage, and return us home safe into our native countries, if we take time, and not tempt him too far by our wilfulness.

Indeed most of these reasons were in view, and I could not tell what to say to oppose them; nor any reason could I give, how we might proceed farther; wherefore (with a sorrowful heart, God knows) I confessed that the helm should be born up, and a course shap'd for England, well hoping that his majesty would graciously censure of my endeavours, and pardon my return. And although we have not discovered populous kingdoms, and taken special notice of their magnificence, power and policies, brought samples home of their riches and commodities, pried into the mysteries of their trades and traffick, nor made any great fight against the enemies of God and our nation; yet I wish our willingsness in these desert parts may be acceptable to our readers. When we bore up helm, we were in latitude 65. 30. at least N. W. and by N. from *Nottingham* island. Some were of an opinion, that we were farther to the northward; but by reason it was by judgment, I chose to set down the lesser distance.

The 27th the wind came up at N. W. with which wind we could not have gone on in our design: That wind made no great swelling sea. By noon we were athwart of cape *Charles*, so that we went in betwixt that cape and *Mill* Islands. The last night it did snow very much, and was very cold, so that all our rigging and sails were frozen; and all the land covered over with snow. And here (since I have formerly spoken that it snows very much) it will not be amiss to consider of the reasons of it. When I was upon *Charleston* island, (our wintering place) and in *June*, when the snow was clearest gone off the ground, I have in the nights, (and some of them following the hottest days) observed, whether there fell any dew or no; but I could never perceive any, and (under correction of the learned) from mois and sand, little (methoughts) was to be expected. Now of what was exhald from the snowy ice and cold sea; what could there probably be returned but the like again? Generally we continued on our course, blinded with foggy and dirty weather; and that, intermixt with snow and

Vol. II.

frost, amongst disperst pieces of ice, many of them higher than our topmast-head.

With great variety of winds, we were also driven within three leagues of both shores; so that the last of this month, we were in the narrow of the straight, which is about fifteen leagues over; the fourth shore was much pestered with ice.

September 1632.

The 1st and 2d we continued our endeavour to get on our way.

The 3d in the evening, as the weather cleared up, we did see the south end of the *Island of Resolution*.

These three days and nights had been extreme cold with fog and frost, inasmuch that our men in the evening could hardly take in our topmasts and sprectails. We have sailed thorow much mountainous ice, far higher than our topmast-head; but this day we sailed by the highest that I ever yet saw, which was incredible indeed to be related. Now as the wind comes easterly we feel another sea out of the ocean, and the ship labours with another motion, than she hath done with any that ever we observed to come out of the westward.

From the 3d to the 8th we had variety of winds, and were gotten clear out of the streights, but were now come into such a tumbling sea, (the weather dirty and gusty, and by interims calm again) that the ship did so labour and rowl, that we thought verily she would have rowled her masts by the board. This made her so leaky, that we were fain to pump every glass; yea; her seams did so open aloft, we lay all wet in her.

This was the last day that we saw any ice. The wind now favouring us, we made all the haste we could homeward. By the way, (having endeavoured, observed and experimented some things in my unfortunate voyage) I perfected up my said observations, which being after commanded to publish, I here most submissively offer unto the judicious readers, and raine our private opinion withal, concerning the feasibility of the action intended, which was to find a *Passage into the South-Sea*.

What hath been long ago fabled by some *Portuguese*, that should have come this way out of the *South-Sea*, the meer shadows of whose mistaken relations have come to us, I leave to be confuted by their own vanity. These hopes have stirred up from time to time, the more active spirits of this our kingdom, to research that merely imaginary passage. For my own part, I give no credit to them at all; and as little to the vicious and abusive wits of

6 E

later

later *Portuguese* and *Spaniards*, who never speak of any difficulties, as shoald water, ice, nor sight of land, but as if they had been brought home in a dream or engine. And indeed their discourses are found absurd, and the *Plots* (by which some of them have practised to deceive the world) meer falsities, making sea where there is known to be main-land, and land where is nothing but sea.

Most certain it is, that by the only industry of our own nation, those northern parts of *America* have been discovered to the latitude of 80 degrees and upwards. And it hath been so curiously done, (the labours of several men being joined together) that the main land hath been both seen and searcht, and they have brought this supposed passage to this pass, that it must be to the north of 66 degrees of latitude. A cold clime pestered with ice and other discommodities, and where the *Spaniards* dispositions and their weak specke ships can hardly long endure it. And withal it is thus known, that the entrance of *Hudson's Straights* is but fifteen leagues broad, in the middle not so much; and betwixt *Salisbury* island and the main, that it is but eight leagues. Then proceeding to the northwards, towards the forementioned latitude, it is but fifteen leagues from main to main. This in length is but about 140 leagues, as may more plainly appear by the map. Most infinitely pestered withal it is with the ice until *August*, and some years not passable then; yea I believe the streight is never clear of ice thorowly.

Now most probable it is, that there is no passage, and that for these reasons following.

First, that there is a constant tide flood and ebb setting into *Hudson's Straights*, the flood still coming from the eastward, which as it proceeds (correspondent to the distance) it alters his time of full sea. This also entering into bays, and broken ground, it becomes distracted, and reverses with half tides.

Secondly, here is no small fish, as cod, &c. and very few great ones, which are rarely to be seen; nor are there any bones of whales, sea-horses, or other great fish to be found on the shore, nor any drift-wood.

Thirdly, That we found the ice in the latitude of 65. 30. to be lying all over the sea in rands; and I am most certain that the shoalds and shoald-bays are the mother of it. Had there now been any ocean beyond it, it would have been broke all to pieces; for so we found it coming thorow

the streight into the sea to the eastward.

Fourthly, the ice seeks his way to the eastward, and so drives out at *Hudson's Straights*, which I have often observed, being a land upon the island of *Resolution*, and driving amongst the ice in the streight.

Now admit there were a passage, yet is it known, that it is partly narrow, for 140 leagues, and to be infinitely pestered with ice withal, as every one have found, who have gone that way. Comparing therefore some observations taken at *Bantam*, *Gulolo*, and at *Firando* in *Japan*, and the distance betwixt *Japan* and the western part of *Californi*a, with the observations taken at *Charleton* island, (referring all to the meridian of *London*) and then the distance betwixt the meridians of cape *Charles* and the western part of *Californi*a, will be found to be about 500 leagues in the latitude of 66. 00. where yet the meridians incline very much together.

To this may be added, that near about cape *Charles*, the variation is 29 degrees to the west, which is a probable argument, that there is much land to the westward; and that this streight must be very long, and that you have no time to pass it but in *August* and *September* when the nights are so long, and the weather so cold, that it will not be indurable.

Add to this, that neither can any great ships, which are fit for carrying of merchandize, indure the ice, and other discommodities, without extraordinary danger.

Moreover, a thousand leagues is sooner sailed to the southward, and about the cape *de Bona Speranza*, (where the winds are constant) and that with safety, than a hundred in these seas, where you must daily run the hazard of losing ship and lives: Put hereunto that comfort for the sick, or refreshing for your men, here is none to be had in these quarters.

Towards the latter end of *August* and in *September*, the weather grows tempestuous, and the winds incline to be westerly, that there will be but small hope of performing your voyage this way.

But let us (by way of imagination only) enlarge this streight, in this latitude, and free it of ice; yet what advantage, in speedy performance, will be gotten by this passage, if the winds be withal considered? To *Japan*, *Cbina*, and the northern parts of *Asia*, it may be the nearer cut; but in navigation, the farthest way about is well known, in fewer days to be performed, yea with lesser pains, and more safety of ship and goods.

Again: To the *East-Indies* and other parts, where we have the greatest commerce and employment of shipping, the other way is as near. What benefit of trade might have been obtained in those northern parts of *Asia*, I will not presume to speak of; holding that there is a great difference betwixt those parts and the northern parts of *America*; whereas I am sure that there is none in any place where I have been all this voyage.

The 22d of *October* we arrived in the road of *Bristol*, having been hindered and crost with much contrary tempestuous winds and weather. The ship being brought into harbour, and hal'd dry a ground to look to her, it was there found, that all her cut-water and stern were torn and beaten away, together with fourteen foot of her keel; much of her sheathing cut away, her bows broken and bruised, and many timbers crackt within board; and under the starboard bulge a sharp rock had cut thorow the sheathing, the plank, and an inch and a half into a timber that it met withal. Many other defects there were besides, so that it was miraculous how this vessel could bring us home again. Being all here arrived, we went all to church and gave God thanks for his preservation of us amidst so many dangers. I very well know that what I have here hastily written, will never discourage any noble

spirit, that is minded to bring this so long tried action to absolute effect; and it is likely withal, that there be some, who have a better understanding, and a surer way of prosecuting of it, than myself have: To whose designs I wish a happy success. And if they do but make a review of what hath been done, and give more certain celestial observations, hydrographical descriptions, or exacter practice in navigation, it will be a most commendable labour. For although I have spent some years of my ripest age, in procuring vain intelligence from foreign nations, and have travelled unto divers honourable and learned personages of this kingdom, for their instructions; have bought up whatever I could in print or manuscript, and what plot or paper soever conducing to this business, that possibly I could procure; and have served voluntarily besides, and spent some time in rendering a relation, (since my coming home) and expended withal of my own monies, in my aforesaid endeavours, and in furnishing of extraordinary necessities above 200 *l.* in ready money; yet I repent not myself, but take a great deal of comfort and joy, in that I am able to give an account (in some reasonable way) of those parts of the world, which heretofore I was not so well satisfied in.

## COPY of the LETTER

Which I left at

C H A R L E T O N,

Fastened to the Cross, July 1, 1632.

**B**E it known to any that shall haply arrive here, on this island of *Charleton*, that whereas our sovereign lord, *Charles I.* king of *England*, *Scotland*, *France*, and *Ireland*, Defender of the Faith, &c. having a desire to be certified, whether there were any passage or not, by the north-west or north-westward, thorough these territories into the fourth sea: Some of the better minded merchants, of the worshipful company of merchant-adventurers of the city of *Bristol*, to satisfy his majesty therein, did voluntarily offer to set forth a convenient ship for that purpose, well mann'd, victualled, and furnished with all other necessaries. This free offer of theirs was not only commended, but graciously accepted of by his majesty. Whereupon, they fitted and furnished forth a ship, called the *Henrietta Maria*, of the burthen of 70 tuns, victualled for 18 months. A number thought convenient to manage such a business was 22 men, whereof 19 were choice able men, two youngers, and my unworthy self their commander. All which, the *Bristol* merchants did most judiciously and bountifully accommodate, and had in a readiness, the first of *May*, 1631.

The 3d of *May* we began our voyage out of the road of *Bristol*, commonly called *King's Road*, passing about the cape *Cleere* of *Ireland*, upon many courses, but reduced to a west north-west, we sailed along, and upon the 4th of *June*, we made the land of *Greenland* to the northward of cape *Farewell*, where for the space of two days, we were dangerously engaged amongst the ice. Being clear of it, we doubled cape *Farewell* to the southward, and so continued our course to the westward, continually sailing and thrusting the ship thorough much ice.

The 19th of *June* we made the island of *Resolution*, and endeavouring to compass about it to the southward, we were taken with a strong westerly wind, which drove the ice and it us, upon the shore. In that distress, (seeing it was broken grounds and main inlets into it) I sent the shallop to seek and found a place for our refuge; but when she was departed, she was in as great danger as we, and could not return to us by reason of the ice. We being now driven very near the rocks, were fain to set our sails, and force the ship into an opening, adventuring her amongst unknown dangers to avoid apparent, before we could moor her in a place (as we thought) safe from danger.

The 22d of *June*, (this inlet being full of ice) that ice upon the ebb, so jam'd one piece into another, that it altered the ordinary course of it, and it came upon the ship, and put her against the rocks, notwithstanding our utmost resistance. As the water ebb'd away, the ship hung by the keel upon a rock, and heel'd to the offing. As soon as we perceiv'd this, we made fast some hawfers to her masts, and to the rocks, to hold her upright; but all in vain; she sunk still, as the water ebb'd away; so that she was so turned over, that we could not stand in her. Hereupon, we got all upon a piece of ice, looking upon her, and praying God to be merciful to us. The rock that she hung upon, was a little abaft the mainmast, which made her hang after the head, and she sunk over so much, that the portlass of the forecaltle was in the water. At length, it pleased God the flood came, before it had ebb'd so low as the tide before and after, by a foot; and the ship rose, and was safe and sound: And thus were we miraculously delivered. With  
the

the first wind, we proceeded to the westward, continually being pestered with so much ice, that it was about the middle of July before we could attain to Sir Dudley Digge's island. And here I was put to my consideration; for whereas by my directions, I was to search especially two places; one from Digge's island to the northward, and sailing there, to go to the *Checks* and *Hubbart's* hope, and so to search it to the southward; I now finding the sea much pestered with ice in the latitude of 64. 00. and as far as we could see to the northward; and that the time was so far spent, as that before I could do any thing that way, it would be August, and then as much trouble to return again to Digge's island; and that by that time, the year would be so far spent, the nights so long and cold, that I fear'd I should be forced with shame to return into England again that year. Wherefore I took my way to the westward, by *Mansfield's* island; on which I landed twice, still hindered and incumbered with ice. Thence I proceeded westward, hoping for an open sea in the bay. We were there more troubled with ice, than in any place before; so that it was the 11th of August, before we had sight of the western land, which we made in latitude 59. 30. something to the southward of the *Checks*. We were not able to attain thither, by reason of the contrary winds and ice, but were observant of the current of the tides; which after, by experience, we found to come from the northward. We coasted along the shore, in sight of land, and in ten fathom water to the southward; and entered that inlet, which heretofore was called *Hubbart's* hope; which was the very place where the passage should be, as it was thought by the understandingest and learnedest intelligencer of this business in England. We failed to the very bottom of it, into three fathom water, and found it to be a bay of some eighteen or nineteen leagues deep. From thence we proceeded to the southward, in sight of land for the most part; and although I was as careful to keep the lead always going (it blowing a fresh gale of wind, and a pretty big sea) yet before the lead was up, the ship struck upon a flat rock; (she then being under foremast, foretopmast, maintopmast, and sprit-sail) and gave three fore knocks, and got over it. Being past this danger, we proceeded, and pass'd by port *Nelson*. Finding the land trend to the eastward, we began our discovery of it more carefully; because that no man (that ever I could hear or read of) did ever see this land before. We stood into six and five fathom;

Vol. II.

for it is very low land, and trends for the most part E. S. E. and E. by S.

The 27th of August I entered upon it, and in the name of the merchants-adventurers of *Bristol*, took possession of it to his majesty's use, naming it, *The New South-West Principality of Wales*. I brought from the land some small trees and herbs, and killed divers sorts of fowl, in sign of seizure, which I brought aboard. Not long after, (being put back to the westward with contrary winds) we spake with captain *Fox*, in a ship of his majesty's, set forth for the same purpose that we were: I invited him aboard, and entertained him with such fare as we had taken in this new discovered land; and made him a relation of all our endeavours: The like did he to us, and withal told us, that he had been in port *Nelson*, where he had put up a shallop, and found there many things which Sir *Thomas Button* had left there. The next day he departed from us, and stood to the westward, and we never saw him since. His ship, he, and all his company were very well. We continued our discovery to the eastward, and came to the eastern-point, which is in latitude 55. 06. which we named cape *Henrietta Maria*. There the land trends to the southward, and we followed it in sight, but were put off with foul weather; which being over-blown, we stood in again for the western shore, (that we might leave no part unseen) and followed it again to latitude 54. 40. The second time we also put off, with like foul weather, which made us stand to the eastward. In this way we past by some islands, and happened amongst broken grounds and rocks, in latitude 53. 30. where we came to an anchor, and sheltered ourselves some few days, shifting roads. Now the winter began to come on, and the nights to be long and cold; that amongst these dangerous places, we were fain to spend the day to look for security for the night. Here, by misfortune, our ship came aground; and that amongst great stones, as big as a man's head, where she did beat for the space of five hours most fearfully. In this time, we lightned her, and carried some of our things ashore; so that by the great favour of God, we got her off again; whereupon we named this island, *The island of God's Favour*. After that again, amongst those rocks, we were put to many extremities. At length, (having a gentle southerly wind) we stood along the eastern shore to the northward, now looking for a convenient place to winter in. And here again, were we assaulted with a violent storm, in which we lost our shallop, and were driven amongst divers dangers;

6 F

and

and seeing an opening betwixt two islands, we ventured to go in, in very foul weather. We found it to be a very good sound, and there we came to an anchor. We landed on one of them, which we named, *The Lord Weston's Island*; and mann'd out our old ship boat upon it. The other island, we named my *Lord of Bristol's Island*. Parting from hence, we stood to the southward, to look for a wintering place, because the time of discovery was past for this year. Many were our troubles amongst these islands, shoals and broken grounds, which made us strain our ground tackle for life many a time.

The 6th of *October* we arrived in this bay, it seeming a very likely place to find a harbour in; but searching the likeliest places, we found it all so shoaled flats and rocks, and stony by the shore side, that we could by no means bring our ship near the shore, but were forced to ride a league off, in three fathom and a half water.

The winter came on apace, the weather proved tempestuous, and the cold so multiplied, that our sails froze in lumps to the yards unmanuable. Neither could our only boat go from the ship, by reason of the weather. About the middle of *October*, I caused a house to be made ashore, where our sick men might the better recover; but always with an intent to take it down, if we found otherwise a place for our ship. I sent likewise men afoot, (seeing the boat could not go) to discover the island, and to see if they could find some creek or cove, but all in vain; we spent the time with hope of fairer weather, till now the cables began to freeze in the house, and the ship to be frozen over with the spew of the sea; so that we were fain to shovel the snow off our decks. Moreover, the water began so to congeal by the shore side, that the boat could hardly get ashore. Yet for all that, if the wind blew N. W. there went a very great surf on the shore, and such a great sea in the bay, that there was no lringing of our ship aground. Besides this, she would have then lain open to the E. and S. E. and S. and indeed the nearest land, all about that way, was two leagues off. Hereupon, we continued out the extremity at an anchor.

The 29th of *November*, the ice came about us on all sides, and put us from our ground tackle, and would have driven us out of the bay upon rocks and shoals, (where undoubtedly we had perished) but that by God's great goodness, it proved so warm a day, (the wind at S.) that suddenly we brought up some sail, and hoist it up with ropes, and so forced her ashore; where she beat all that night very forely.

The ship being now grounded and quiet, we considered what was best to do with her, and resolved to sink her; but the next tide, before we had any of our provisions ashore, the wind came N. W. so that the ship beat most fearfully. We got all our dry provisions up to the upper deck, and made a hole to sink her; but before she was sunk, she beat so extraordinarily, that we all thought she had been foundered. Being sunk down so low, that the water came on the upper deck, we took our boat and went all ashore, in such pitiful cold weather, that we were all so white frozen, that some sick men that were ashore before, did not know us one from another.

The next day we fell to land our provisions: First our bread, fish, and dry things, the men driven to wade in the water up to the middles, most lamentable to behold. Within two days, what with great flat pieces that stuck about us, and that which froze, it was become firm ice, betwixt the ship and the shore; so that then we were fain to carry all things on our backs a mile from the ship to the house. Within few days, the hold became so frozen, that we could not get all our things out of it, but were fain there to leave it frozen till the next year. Then we made us two other houses: Our first house was our mansion house, wherein we did all lie together; our other was to dress our victuals; and the third for a store-house; which we built a pretty distance off, for fear of fire. And now we considered of the estate we were in, we all doubted that the ship was foundered, especially our carpenter. But suppose she were found, yet was it a question, whether we could get her off in the summer, when the tides are low. Moreover, she might be spoiled, lying in the tides way, when the ice brake up; and then we should be destitute of any vessel to bring us home. The carpenter undertook to build a pinnace, of the burthen of twelve or fourteen tun, that should be ready by the spring; that if we found the ship unserviceable, we might tear her up, and plank her with the ships plank. Upon this we resolved, and by *May* brought it to that pass, that she was ready to be joined together to receive the plank. But God mercifully provided otherwise for us: We endured a bitter cold winter, in which it pleased God to visit us with sickness; so that in the beginning of *May* 1632, there was but myself, and the master and surgeon, perfectly sound, and he began to find some defect also. About the beginning of *April*, we began to dig the ice out of our ship, which by the middle of *May* we had effected.

The 24th of May the ice began to break up betwixt the ship and the shore; and about the middle of June we had off our ship, and found her to be stanch and sound, contrary to all our expectations. Before this time, about the middle of May, our carpenter died; and with him the hope of our pinnace: Master Warden died the 6th of May; our gunner, Richard Edwards, had his leg broken (which was cut off) at the capstang in August 1631, and languished till the 22d of November, on which day he died. These three men lie buried here under these tombs of stones. We lost another man, one John Barton our quarter-master, who miscarried in the little bay that is due west from this cross three miles; the ice breaking under him, so that he sunk down, and we never saw him more. The two pictures which are wrapt in lead, and fastened uppermost on this cross, are the lively pictures of our sovereign lord and lady, Charles I. and queen Mary his wife, king and queen of England, Scotland, France and Ireland, &c. The next under that is his majesty's royal arms; the lowermost is the arms of the city of Bristol.

And now we are in a readines to depart this day, and I intend to prosecute our discovery to the westward, in this latitude of 52. 03. and so the southward also, although with little hope. Failing there, I mean to haste to Digg's island, and endeavour to discover to the northward. Thus having had some experience of the dangers of the ice, shoals, and rocks of unknown

places, I thought it necessary to leave this testimony of us and our endeavours, if God should take us into his heavenly kingdom, and frustrate our return into our native country. Wherefore I desire any noble minded traveller, that shall take this down, or come to the knowledge of it, that he will make relation of it to our sovereign Lord the king's majesty, and to certify his grace, that we cannot as yet find any hope of a passage this way; and that I do faithfully persevere in my service; accounting it but my duty to spend my life to give his majesty contentment, whom I beseech God to bless with all happiness. And that they would likewise advertise our worshipful adventurers of all our fortunes; and that if as aforesaid, we perish, it was not by any want or defect in ship or victual, or other necessities; all which we have in abundance for four months and above; which if occasion be, we can prolong to six months. Thus being at present unable to express a grateful mind otherwise but in my prayers to God, I heartily beseech him to pour out his bountiful blessing upon all their honest endeavours, and to continue their noble dispositions in actions of this kind. And I faithfully promise, that if I shall come where the like letters and tokens shall be left, to make a true relation of it, as it shall be desired. So desiring the happiness of all mankind, in our general Saviour Christ Jesus, I end,

Charleton, July 2.  
1632.

Thomas James.

## *The NAMES of the several INSTRUMENTS, I provided and bought for this Voyage.*

**A** *Quadrant* of old seasoned pear-tree wood, artificially made, and with all care possible divided with *diagonals*, even to minutes. It was of four foot (at least) *semidiameter*.

An *equilateral triangle* of like wood, whose *radius* was five foot at least, and divided out of *Petiscus's* table of *tangents*.

A *quadrant* of two foot *semidiameter* of like wood; and with like care projected.

The *sights*, *centers*, and every other part of them look'd to, and tried with convenient *compasses*, to see if they had been wrong'd or alter'd. And this continually, before they were made use of.

*Staves for taking altitudes and distances in the heavens.*

A *staff* of seven foot long, whose *transome* was four foot, divided into equal parts by way of *diagonals*, that all the *figures* in a *radius* of ten thousand, might be taken out, actually.

Another of six foot, near as convenient, and in that manner to be used.

Mr. *Gunter's* *cross-staff*.

Three *Jacob's staves*, projected after a new manner, and truly divided out of the table of *tangents*.

Two of Mr. *Davis's* *back-staves*, with like care made and divided.

### *Of Horizontal Instruments.*

Two *femicircles*, two foot *semidiameter*, of seasoned pear-tree wood, and divided with *diagonals*, to all possible exactness.

Six *meridian compasses*, ingeniously made; besides some dozens of others, more common.

Four *needles* in square boxes, of six inches *diameter*, and other six of three inches *diameter*.

Moreover, four special *needles* (which my good friends Mr. *Allen* and Mr. *Marre* gave me) of six inches *diameter*, and touch'd curiously, with the best *load-stone* in *England*.

A *load-stone* to refresh any of these if occasion were, whose *poles* were marked for fear of mistaking.

A *watch-clock* of six inches *diameter*, and another lesser *watch*.

A table every day calculated, correspondent to the *latitude*, according to Mr. *Gunter's* directions in his book, the better to keep our *time* and our *compass*, to judge of our *course*.

A chest full of the best and choicest *mathematical books*, that could be got for money in *England*; as likewise Mr. *Hackluite*, and Mr. *Purchas*; and other books of *journals* and *histories*.

*Study instruments*, of all sorts.

I caused many small *glasses* to be made, whose part of time, I knew to a most insensible thing, and so divided and appropriated the *log-line* to them; making use of *Wilbrordus Snellius* his numbers of feet answering to a *degree*, and approved of by Mr. *Gunter*.

I made a *meridian-line* of 120 yards long, with six *plumb-lines* hanging in it; some of them being above 30 foot high, and the weights hung in a hole in the ground, to avoid wind. And this to take the *sun's* or *moon's* coming to the *meridian*. This line we verified, by setting it by the *pole* itself, and by many other ways.

Two pair of curious *globes*, made purposely; the workman being earnestly affected to this voyage.

This was the manner that we took the variation of the Compass, and that as often as conveniently we could, but divers of the tables, by negligence of my boy are lost; but these (I hope) may suffice to give satisfaction of our care in navigation.

July 13, 1631. These 13 Azimuths, with the *Altitu. Dec.* were taken upon a great piece of ice, with three Needles together; then the Declination was not equated, the last three set forth by themselves, proves the rest; viz. the Azimuth of W. with his Variation, the Azimuth at due W. and the Variation by the Altitude and Azimuth at due W.

These were taken 20 leagues to the eastward of Salisbury island; and two *Qyad*, one of four, another of two foot, *Semid. Semicircle* of two foot *Semid.*

An

## An APPENDIX touching Longitude.

Latitude and longitude are two primary affections of the earth; by the help of these two, doth the geographer strive to represent the parts of the earth that they may keep symmetry and harmony with the whole. Latitude then is an arch of the Meridian, comprehended between the æquator and a parallel; but longitude is an arch of the æquator, intercepted between the prime meridian and the meridian of a place, the difference of longitudes being the difference of two meridians. The measure of the former is the meridian, the æquator of this latter. For the exact settling of latitudes we have many and absolute helps, so that the error, if any happen, ought to be imputed to the imperfect handling of the artist. But the longitude of a meridian is that which hath, and still wearieth, the greatest masters of geography. Nevertheless hath not the wise creator left man unfurnished of many excellent helps to attain his desire: For besides eclipses, especially of the moon, (whose leisure we must often wait, and perhaps go without, if the heavens be not propitious to us) we have the concurrence of quick pac'd inferior planets, with superior slow ones, or their appulses with some fixed star of known place, or else some other artifice derived from their motions and positions. As for the magnetical needle to argue a longitude from its variation, is altogether without ground. And though well furnish'd seamen are able by their dead reckonings (as they term them) to determine the difference of meridians somewhat near, yet by reason of the unknown quantity of a degree in a given measure, (which is the rule of the ships way) varieties of adverse winds, different sets of tides, and other involved incumbrances, they come often wide of the mark they aim at. The best way yet known to the world, is that which is deduced from the celestial appearances, which being performed by judicious artists, may in short time rectify our geographical and hydrographical charts hitherto in most places foully distorted. It is my intent here, to give an instance from two several observations drawn from the celestial bodies, by the author of this discourse, in his discovery for the N. W. at the bottom of the bay, being his wintering place, and called by the name of *Charlton*, which for judgment, circumspection, and exactness, may compare with most: The first, from the eclipse of the moon; the second, from the moons mediation of heaven, or her coming to the plan of his meridian of *Charlton*.

The captain then mindful of the lunar eclipse, which was to happen *October 29, Anno 1631*, was waiting on the moon with his instruments, but by reason of the interposition of the clouds, could make no observation on the beginning of her obscuration, but at her emerſion or total recovery of light, the heavens being more serene, he took the altitude of the superior limb of the moon 29 deg. 11 min. the latitude of *Charlton* being 52 deg. 3 min.

At that very time, myself, with some friends, found the exact time of the moons emerſion at *London* in *Greſham* college, (by a quadrant of six foot Radius, actually cut to each minute of the quadrant) to be *October 29. 13 h. 7 min. 28 sec.* or *October 30 day, at one of the clock, 7 min. and about a half in the morning*.

Now because the tables of the celestial motions, lately published by the most learned and industrious *Lansberg*, do much amuse the world, with that lofty title of perpetuity, it shall not be amiss to enquire after the time of the captain's observation from them, that so by comparing the one with the other, we may obtain the difference of meridians, which is the matter now sought after.

The middle motions of the luminaries answerable to the equal time of the emerſion of the moon, are these which follow.

		Sex.	Deg.	M.	Sec.
The middle motion of the	{ Sun	3	47	39	26
	{ Center of the sun	3	15	49	58
	{ Apogæum of the sun	1	35	45	44
The middle motion of the	{ Longitude of the moon	2	59	29	1
	{ Anomaly of the moon	0	5	11	30
	{ Latitude of the moon	4	32	8	15
The Prosthaphæresis of the æquinox		0	0	12	30

Being thus furnished with these middle motions, we are next to enquire for the true places of the luminaries and their concomitants, as their right ascensions, the declination, latitude, semidiameter, parallax, and refraction of the moon, that so the true altitude

of the moons center, and consequently the time of the emerſion may be had at *Charlton*.

	For the ſun's true place.	Sex.	Deg.	M.	Sec.
The middle motion of the ſun's center	3	15	49	58	
The Proſthaphæreſis of the center add	0	1	37	0	
The proportional ſcruples					
The middle motion of the ſun's apogæum	1	35	45	44	
The true motion of the apogæum ſubtr.	1	37	22	24	
The middle motion of the ſun is	3	47	39	26	
The anomaly of the ſun's orb	2	10	16	42	
The proſthaphæreſis of the ſun's orb	0	1	32	43	
The exceſs to be added	0	0	0	20	
The abſolute proſthaphæreſis of the ſun's orb ſubtr.	0	1	33	3	
The middle motion of the ſun from the true æquinoctial	3	47	51	56	
The true motion of the ſun from the true æquinoctial	3	46	18	53	
Therefore the ſun's true place was in <i>Virgo</i>	0	16	18	53	
And his right aſcenſion		223	49	53	

	For the moon's true place.				
The anomaly of the moon's center	5	59	18	2	
The proſthaphæreſis of the moon's center	0	0	5	30	
The proportional ſcruples	0				
The anomaly of the moon's orb	0	5	11	30	
The æquated anomaly of the moon's orb	0	5	5	54	
The proſthaphæreſis of the moon's orb ſubtr.	0	0	24	4	
The middle motion of the moon's longitude from the ſun	2	59	39	1	
The true motion of the moon's longitude from the ſun	2	59	14	57	
The middle motion of the ſun from the true æquinoctial	3	47	51	56	
The true motion of the moon from the true æquinoctial	0	47	6	53	
Therefore the moon's true place was in <i>Taurus</i>	0	17	6	53	

	For the moon's latitude.				
The middle motion of the moon's latitude	4	32	8	15	
The moon's abſolute proſthaphæreſis of her orb ſubtr.	0	0	24	4	
The moon's true motion of latitude	0	31	44	11	
The moon's northern latitude was	0	0	9	5	
And her reductive ſcruples ſubtr.	0	0	0	26	
But the moon's true motion in her proper orb was	0	17	6	53	
Therefore the moon's true place reduced to the eclipt. <i>Taurus</i>	0	17	6	47	
And becauſe the north latitude of the moon was	0	0	9	5	
Therefore will her right aſcenſion be	0	44	35	10	
And her declination	0	17	7	40	
And becauſe we have the diſtance of the moon, from the earth in } ſemidiameters of the earth	0	64	15	0	
Therefore ſhall the moon's apparent ſemidiam. be	0	0	15	0	
And her parallax of altitude	0	0	47	0	
Now becauſe the altitude of the limb of the moon was found by ob- } ſervation to be	0	29	11	0	
If we ſhall ſubſtract her ſemidiameter	0	0	15	0	
And the refraction	0	0	2	0	
We have the apparent altitude of the moon's center	0	28	54	0	
To this if we add the parallax of altitude	0	0	47	0	
We ſhall have the true altitude of the moon's center	0	29	41	0	
Having thus the latitude of the place, the moon's true altitude with } her declination, by the reſolution of a ſpherical triangle, accord- } ing to the 11 <i>Prob. Lib. 2. Part. 2.</i> of our <i>Britiſh Trigonometry</i> , } we have the diſtance of the moon from the merid.	0	63	26	0	

And by comparing this arch with the difference of the aſcenſions of the luminaries, the time of the moon's total recovery of her light at *Charlton*, will be 7 h. 49 min. 28 ſec. which ſubtr. from the time of the emerſion at *London*, 13 h. 7 min. 28 ſec. The difference of meridians, in reſpect of time, will be 5 h. 18 min. ſo that *Charlton* is removed from *London* weſtwards, 79 deg. 30 min.

This may likewiſe be confirmed by a ſecond different obſervation made at the inſtant of the moon's culmination or mediation of heaven, at which time the altitude of the brighteſt ſtar in the afterſin of the northern crown, (being of the ſecond magnitude) was found to be 53 deg. 27 min. eafterly, *Anno* 1632, *June* 23. It

## An Appendix touching Longitude.

485

It may be problematically delivered after this manner.

Having the latitude of a place, with the altitude of a known fixed star at the moment of the moon's culmination, to find the longitude.

This fixed star is of known longitude and latitude, therefore was his declination 27. 59. and right ascension 229. 46. Now by the resolution of a spherical triangle of three known sides, we have the distance of this star from the meridian, and by consequence the right ascension of the moon, whence we conclude her culmination to be with the 28 deg. 10 min. of *Aquarius*; but the moon's true place was much less. Here note, that the scrupulosity of time is unknown, and therefore we cannot argue the moon's true place from thence, (though I grant it might be evinced) for that were to beg the question, and to know that first, which we look after.

In the next place we are to enquire with what point of the ecliptick the moon did culminate with us here at *London*, that so from the difference of her places of the like affection, we may deduce the difference of meridians.

Observation on the moon's culmination here at *London* we made none; therefore must we have recourse to the aforesaid tables of *Lansberg*, and from thence calculate the same. Now because the moon was not far removed from the sun's opposite point, it will not be amiss to enquire first the moon's place at midnight.

	Sex.	Deg.	M.	Sec.
The sun's opposite place at midnight in <i>Aquarius</i> _____	0	11	18	15
The moon's true place at midnight reduced to the eclip. was in <i>Aquarius</i> 0	23	33	18	
The south latitude of the moon was_____	0	4	56	38
Therefore the difference of ascensions will be_____	0	14	6	0
The diurnal motion of the moon_____	0	14	24	0
Therefore the moon's proper motion answerable to the difference of } ascensions is_____	0	0	33	50
Which added to the moon's true place at midnight_____	0	23	33	18
Gives us the moon's true place reduced to_____				
The ecliptick at her culmination at <i>London</i> _____	0	24	7	8

Now because the moon's southern latitude was 4 deg. 56 min. 38 sec. the arch therefore of the ecliptick comprehended between the moon's true place and the culminating point of the ecliptick, will trigonometrically be found to be 54 min. 38 sec. which added to the moon's true place before found, gives us the culminating point of the ecliptick, 25 d. 1 min. 46 sec. which is less than that found at *Charleston*, the difference being 3 d. 8 min. 24 sec. therefore is the place of observation westerly of *London*. Having therefore the moon's diurnal motion, and the difference of the culminating points, we conclude the meridian of *Charleston* to be distant from this of *London* 5 h. 14 min. of time, of 78 deg. 30 min. of the equator.

The difference between that of the ecliptic, and this latter observation, is only 4 min. of time, or one deg. a difference easily pardoned, especially if we shall compare the same with some other places, yea even such as border nearly on each other. To give an instance on two eminent places which lie in the heart of *Europe*, *Rome* and *Norberg*: Their difference of longitude, *Regiomontanus* makes 36, *Werner* 32, *Appian* 34, *Mestlin* and *Origan* 33, *Stoßer* 18, *Maginus* 26, *Schöner* 12, *Mercator* and *Hondius* as much, *Stadius* 13, *Jansonus* 10, *Longomontanus* 16, *Lansberg* 10, *Kepler* by two observations on two lunar eclipses, but 4 min. of time.

This variety among these great artists, will I hope, pardon us this difference of 4 min. and be a means to encourage our *English* seamen, and others, to make such or the like observations in foreign parts as the heavens shall be offered unto them.

H. GELLIBRAND.

*To the Venerable Artists and younger Students in Divinity, in the famous University of Cambridge.*

**Y**OU nobly-witted and ingeniously studied academians, whose excellency in all kinds of learning, all foreign universities do admire, and none attain unto; I here present you a voyage to *Choccos*, though not the golden fleece with it; the search, I mean, but not the finding, of that so much talk'd of, so often sought for, north-west passage, and nearer way into the *South-Sea*. That, wherein so much time and treasure have been expended, so many brave spirits employed, and yet none discovered. Perchance, there is no such passage to be found, and that the *Spaniards*, by the gullery of their false sea-charts, and the fable of an old *Greek* pilot, have but diverted our *English* and *Dutch* seamen, from their golden *Indies*. This plot of theirs hath taken, for these many years, and it appears to be but a plot, for that themselves never make use of this passage. For mine own part, I suppose that the philosopher's stone is in the north-west passage. My argument for it, is, for that there's so much philosophy in the way to it.

So much, and such variety; such variety, and that so various (I think) from what is received in the schools; that it were well worth the disquisition of an university, (and I wish you the first honour of it) either to find out, how these observations may be reduced to *Aristotle's* philosophy; or whether they need any other enquiry, and ought to be examined by some other rules, than *Aristotle* hath yet light upon. This is my purpose of inscribing it unto you. Of this one thing am I confident: that you are all so rational and ingenious, as to prefer truth before authority: *Amicus Plato, amicus Aristoteles*, but *magis amica veritas*. Your sciences, then, being liberal; your studies, I know, have so far passed into your manners, that your minds are so too, and that such as have already profited beyond the credulity required in a young learner, and are themselves promoted to be masters of the arts; though they still reverence their old *Greek* tutor, yet they will not suffer that of *Pythagoras's* school, so to domineer in *Aristotle's*, as to let an *ipse dixit*, go away with it: much less allow it the authority of a mayor's hammer, with one knock to silence all arguments.

Upon this confidence, I with all due respects here prefer two propositions unto your discussing.

The first this, *Whether those rules of Aristotle's philosophy be to be allowed so universal, that they hold all the world over.*

The second this, *Whether they ought to be so magisterial, as to prescribe against all other examinations.*

The first of these I shall but *problematically* propound unto you: but in the second, I hope a man of my cloathing may be allowed the freedom of being something more earnest.

But that I may not come with prejudice to the making of these motions, or be thought upon some *ignorance* or *ambition*, to speak against the incomparable *Aristotle*; I shall desire all my fellow academians to allow me so much discretion, as to know, that he that shall in your hearings oppose your *Aristotle*, does like the ship here spoken of, run against a rock, endanger his own bulge, and the staving of his vessel. No, I so far honour the old *Aristotle*, that I will allow him to be *master* and *moderator* of the schools; and that there is the same respect due to him in the schools, which, by *reason* and *long custom*, is due to one of the *king's ships* in the narrow seas; That in acknowledgement of a sovereignty, every other name ought to strike sail to him. *Aristotle* (it must be confess'd) hath made all learning beholden to him: no man hath learned to confute him, but by him; and unless he hath plow'd with his heifer. He had the most incomparable wit, and was the most logical and demonstrative deliverer of himself, of all the sons of nature: One who best of all deserved to be called, *her principal secretary*; one who not only adorns a library, but makes it: *Qui habet Aristotelem, habet bibliothecam*, is truer of him, than of the great comparer. This is my opinion of him; and I wish him more studied.

'Tis not therefore the name or the authority of the great *Aristotle*, that my propositions meddle withal; but whether his observations gathered out of this part of the world alone, could, like a royal pass or commission, carry a man all the world over?

It must be confess'd, that in respect of the *equinoctial*, and the latitude that *Aristotle* lived in, he was but a *northern man*; and 'twas his own rule, that *nihil agit extra sphaeram aëritatis sue*. So then it would be put to voices, to consider whether he that knew but these northern parts, and the *Mediterranean* sea, could possibly make such collections, by what was here to be learned, as should be unfailable in the southern hemisphere.

sphere and the two Indies? Plainly, those that are conversant in navigations and books of voyages into those parts, have found so many contrarieties to observe, that it were rather tedious than difficult, to fill up a notebook with them.

The ancients, we know (as if they had measured the world by the yard-wand) restrained the limits of temperature and habitation, by the five zones, without consideration of any interloping or concurring causes, which experience hath now found out, to have quite altered their observation. I add, that a good leisure and diligence might observe, how in the contrary part of the world there be found clean contrary causes and effects, unto those in this part of the world.

The south wind there brings cold and winter, and the north is the rainy wind. How will the thunder and the wind be made agree with Aristotle's definition of a meteor? In some places of the mountains Andes by Peru, it thunders ever. The East Indies have their Monsoons and their steady winds, constant for six months together; and who shall assign their causes? Then the doctrine of the tides, nothing so uncertain; which ebb and flow in some places different, and in others contrary to the moon and her motions. This (as I remember) is Aristotle's definition of a meteor, that it is an imperfect mix'd body, generated out of an infirm and inconstant concretion of the elements, which therefore cannot be durable. Now the Monsoon is both constant in his continuance this year, and in his return next year; most constantly keeping his seasons half year one way, and half year another way for all ages, nothing more constantly or durably, and therefore nothing like Aristotle's meteor. And so for the thunder upon the Andes: It is first, perpetual; secondly, not caused by a dry exhalation (as Aristotle wills) but hanging over such hills as are covered with snow, and a perpetual winter. Witness the thunder on the Alps also; yea, and that in the middle of the sea, five hundred leagues from the shore, or any thing that is dry. Yea, it frequently both shows and thunders upon the Andes, at one instant; and in dry places that are hard by, scarce ever thundering.

But not to pass the line for it; you see in this little book how Charleston island, which is no more northerly than your Cambridge, is yet so unsufferably cold, that it is not habitable; and that there encounter so many different (at least so seeming) occurrences of nature, as were well worth the disquisition of a philosopher. I could (in my small reading) instance in many other particulars, which I had rather should be found out by some industrious searchers after nature, in the modern relations of our discoverers, than

in this my short proposition. 'Tis not to be doubted, but that the careful reading of our books of voyages, would more elucidate the history of nature, and more conduce to the improvement of philosophy than any thing that hath been lately thought upon. These navigations have in part fulfill'd that of the prophet, many shall pass to and fro, and knowledge shall be increased. This, I suppose, might be observed from this study, that the great and infinite creator hath so disposed and varied every thing, that it is impossible for man's reason and observation to conclude him; and therefore, tho' vulgar and received philosophy may give a man a general hint, all the world over; yet no universal and unfailling certainty.

This brings me to my second proposition, That seeing God will not have his works, (no more than his kingdom) to come by observation; Whether then ought any human dictates to be so magisterial, as to prescribe against all other examination?

No human study more conduces to the setting forth of God's glory, than the contemplation of his great works in philosophy: For tho' a smattering knowledge in second causes warps the mind towards atheism; yet a higher speculation of them, brings it about again to religion. No man, I believe, will think it fit for us to have a pope in philosophy, one that no body shall presume to censure of, but all be bound to advance his decretals above the holy scriptures. This is the scandal that myself and divers good men take at the undue authority in some heats pinn'd upon the Stagyræ.

I am sorry that the Israelites dotage upon Solomon's philosophy, should have caused the zealous Hezekiah to call in and to suppress those unvaluable physics; for fear, I suppose, lest their credit should have as much derogated from the authority of the holy scriptures; as the brazen serpent (which he destroy'd about the same time) had done from religion. None will believe, that Solomon's philosophy was contrary to the scriptures, seeing the scripture commends Solomon for them. 'Twas not Hezekiah's fear, therefore (or not only) lest there might have been a competition between them, but a neglect of one of them: He was jealous lest the scripture might have any writing set up by it, tho' not against it.

Can divines then be blamed for speaking, when they hear Aristotle's philosophy to be solely magnified, and the study of the scripture philosophy, disrespected? Or that when 'tis confessed, that such a thing is true in divinity, and yet in the moderating of the point, determine for philosophy? Nay, to hear it call'd absurd and ridiculous, to have scripture urged at all in point of philosophy? No doubt

Arist.  
De Mete.

doubt there is; *But whatsoever is false in divinity, is also false in nature*, how much thew of truth soever it passeth with in philosophy. *Philosophy* hath taken its turn in the schools; and the holy texts by the schoolmen, have even been submitted unto *Aristotle's*: Yea, to the great corruption of *theology*, as the complaint is, hath this man been so far advanc'd, that *contra est philosophus, & contra est apostolus*, have familiarly pass'd up and down for equal oppositions; so that it hath been a measuring cast oftentimes betwixt the prophet and the peripatetic, and by foul play hath the measure been made to stand the harder at the peripatetic, for that the prophet hath been enforced to comply with him by a *scriv'd interpretation*. Thus had St. Paul need give his caveat unto *theology* as well as unto *theologues*, *Beware lest any man spoil you through philosophy*.

All this were to no purpose, unless the text of God were excellent in this kind, and embellish'd here and there with most admirable philosophy. What incomparably rare foot-steps of it have we in the books of *Genesis*, *Job*, and the *Psalms*? How noble a study then were it, and how worthy the leisure of some excellently learned to bestow some time upon it? *Valesius* the physician hath in his *Sacra philosophia* done something in this kind; who yet might have done better here and there, for the honour of the scriptures. I am not so sottish to believe, that every particular is to be drawn out of scripture; 'tis none of my dotage, that: Or, that God in scripture did intend, every where, the accurateness of philosophy; or stand to be so curious in definitions and decisions. Nor so foolish would I be thought, as to have all philosophy taken in pieces, and new moulded by the scriptures: Nor, that nothing should be determined on, till a text confirm'd it. But this perchance might profitably be thought upon, that where the scriptures have any thing in this kind, it should more reverently be esteem'd; collections out of scatter'd places (as is done out of *Aristotle*) made; these compared, and their resemblances observ'd. This surely would amount to more than is yet thought of; and, a-God's name, let scholars be so bold with *Aristotle*, as to examine him upon good assurance, by what is *truth's touchstone*. Received philosophy is a most necessary hand-maid to the scriptures; but let her not be set above her lady, nor no competition be maintained betwixt them.

Something else remains to be thought of: That seeing the same God, who gave *Ari-*

*stotle* these good parts, hath, in like manner, rais'd up many excellent spirits more, whether it were not injurious unto what is done, and a discouragement to what might be done; to have the inventions or observations of those excellent wits and great industries, so abash'd with *Aristotle's* authority, that they can have no credit in the world, for that his *dictates* have pre-occupied all good opinion? Let it not then be thought unequal to examine the first cogitations of the old philosophy, by the second thoughts of our more modern artists: For that the same improvement may by this means accrue unto our *physicks*, that hath advanced our *geography*, our *mathematics*, and our *mechanicks*: And let it not be thought so insolent, to refuse *Aristotle's* authority singly, where his reason is not for concluding; seeing other men have taken the boldness to do that before us in several kinds. Some have perfect'd, and others controul'd his *ethicks* by the scriptures; as *Scultetus*, *Wallens*, and some others. *Justin Martyr*, surnam'd the philosopher, hath purposely written *contra dogmata Aristotelis*. *Basson* and *Gassendus* (two brave men) have newly written point-blank against him: nor have they taken away all liberty from those that are to follow them.

And thus, with renewing my former protestation for mine own respects to *Aristotle*, I conclude my two propositions; which I desire may receive a favourable construction from all ingenuous, incapricious scholars. I meant them out of good will to promote learning; to encourage and countenance future undertakings: and in such a case, a little too much saying, may be thought not to have exceeded an honest rhetorician; for I would not be thought too earnest in it. The hint for all this I took from this book; which in mine own and some better judgments, is (to say no more) as well done, and enriched with as sure and useful observations, as any in this kind. I was desir'd by the able author, and some other friends, to overlook the written copy of it, and to amend the *English* here and there; in which I did not despair of doing something, for that, in my younger time I had a little acquainted myself with the language of the sea. That which put me in the head to inscribe it unto your names (most excellently learned Academicians) was, for that the place of this wintering, was within a minute or two of the beight of our Cambridge; which my prayer to God is, that your studies may make famous.

Yours, X. Z.

in like manner, spirits move, whether what is done, might be done; observations on the state of the industries, for the priority, that they would, for that they had all good opinions, might be unequal to the *old philosophy* of our more modern improvements. Our *geography, mechanics*. And *tolerant*, to refuse where his reason other men have not before us is perfected, and the *scriptures*, to others. *Justification*, hath *philosophy*, hath *Kamatata Arijloz*, have men) have certainty him: nor depart from those

## R E A D E R.

**A**MONG those many voyages which lately have been ushered into the World, the following Muscovite embassy may justly challenge a place, especially for its usefulness in geography, which I here present to the reader, without the least alteration, according to the copy thereof, sent to me by Johannes Scultetus, counsellor of state of his electoral highness of Brandenburg. And as the voyages of Mr. Zacharias Wagener, are very famous in Holland, and the following abstract thereof being communicated to me by his brother-in-law Mr. Christian Bothe, a considerable merchant in Dresden, I thought it not unseasonable to subjoin the same, for the benefit of the courteous reader.

*MUSCOW* into *CHINA*.

---

(1.) *The road from Muscow to Siberia.*

**M**OST generally they take their way over *Ustingba*, seated upon the river *Dwina*, from whence we continu'd our journey to *Tobolsko*, the capital city of *Siberia*, being three thousand versts, or six hundred German leagues from the city of *Muscow*. Before you have travell'd the third part of your way, you come to a great ridge of mountains, called *Camiani Rojas*, i. e. *the stone girdle*, by the *Muscovites*; it being their opinion, that they extend round the terrestrial globe. I suppose them to be the same the antients called *montes Siberei*. This mountain being

fifty leagues over, and interwoven with deep valleys, which are generally, but especially in *Autumn*, overflown with water, is impassable in the summer; but these being well frozen in the winter, afford a swift and convenient passage for sleds, so that in twenty four hours you may travel eighteen or twenty leagues, and consequently perform the whole journey from *Muscow* to *Tobolsko* in six or seven weeks. The first city you come to in *Siberia* is called *Worchaturia* from the river *Tura*, upon which it lies.

(2.) *Of the cities, rivers, and fertility of Siberia.*

**S**iberia has twenty three cities, the capital of which *Tobolsko*, situate upon a hill near the river side, is a place of no great traffick; the inhabitants being for the most part *Bouchar* and *Calmuck Tartars*, who are very poor; the chiefest place of trading being *Jenissay*, lying a great way beyond *Tobolsko*, which consists in fables, martins, and such like furs. *Dauri* is the utmost frontier place of *Siberia*, on the *Calmuck* side. *Siberia* is watered by many rivers, among which the river *Oby* is the chiefest. It contains many islands well stor'd with trees. This river is in some places a German league, in other places about half a league broad, and falls into the *Tartarian sea*.

It produces abundance of fish, and among the rest *Beluja's* or *white fish*. The cities of *Siberia* are, *Worchaturia*, *Japonfoi*, *Tumen*, *Tobolsko*, *Damiansky*, *Samara*, *Sergouz*, *Berofolt*, *Narin*, *Tomoko*, *Kosheutz*, *Krajnazar*, *Ket*, *Jenissay*, *Nallen*, *Dauri*, *Takow*, *Magafcy*. These as well as all the other cities of *Siberia*, are not very populous. There are very good corn-fields here, the soil whereof is so good, that it bears very well without dung. It has no sea-ports, the *Tartarian sea* being cover'd with ice summer and winter; however fisher-boats venture as far as the isle of *Malgamfay*, over-against the mouth of the river *Oby*.

(3.) *Of*

(3.) *Of the inhabitants of Siberia.*

THE antient inhabitants were *Tartars*, governed by their own princes or kings; one of the family of their last prince living not long ago, with the Czar's permission, in *Siberia*, till his house was plunder'd, and he forced to fly the country, by the *Russians* that trade that way in fairs, with the *Calmuks Tartars*, which they bring thence in great barges. This prince having afterwards married among the *Calmuks Tartars*, makes sometimes an inroad into *Siberia*, and takes a severe revenge of the *Muscovites* there. The natives being not very forward to oppose him, as living still in hopes, that one time or other he may be in-

strumental in delivering them from the *Muscovite* yoke. The *Calmuks* and *Moguls Tartars* border upon *Siberia*, (besides divers other *Tartarian* nations) their country extending from thence to the frontiers of *China*. There are also divers other herds, living on the frontiers of *Siberia*; as the *Tingiskoy*, the *Watzkoy*, *Tyngiskoy* and *Baraniskoy*, which have each their particular captains or leaders. The natives of *Siberia* are much addicted to sorcery. There are not many *Russians* living among them, by reason of the great distance of this country from *Moscow*.

(4.) *How Siberia was brought under the obedience of the Muscovites.*

ABove a hundred years ago, under the reign of the Czar *Joan Basilowitz*, a certain *Cossack* named *Jormac Timorof*, leader of a certain gang of robbers, having taken some vessels laden with ammunition belonging to the Czar; he issued his strict orders to seize the said *Jormac*, cost it what it would; so that *Jormac* dreading the Czar's revenge, got with his gang into the river *Cama*, and so to *Czotrava*, an isle about five or six hundred *Versts* above *Casán*, which at that time belong'd to a vast rich *Russian* merchant named *Daniel Stroginov*, living in a city built by him, and called *Stroginov* after his name. Having represented to this merchant the easy conquest of *Siberia*, he obtained some arms and ammunition of him to accomplish his design; accordingly he went up the river *Tagit*, till he came to the river *Toura*, where is a considerable island, inhabited by *Tartars*; these he soon chased thence, and continuing his march to the city of *Tumen*, he soon made himself master of it, the same he did afterwards with *Tobolsko* the residence of their king. However he march'd forward fifty leagues to the river *Irtish*, in pursuit of the enemy, who retreated before him. Having refreshed his people hereabouts for six weeks, he

sent three hundred of them to pursue the flying *Tartars*, which they did with so much eagerness, that being surrounded by the enemy, they were almost all kill'd, few escaping their hands. *Jormac* having no more than two hundred men left, intrench'd himself in an isle, but being attack'd in the night-time by the *Tartars*, he was killed with all his followers, except forty, who made a shift to get into *Muscovy*; and having represented unto the Czar all the circumstances of the matter, he sent six hundred chosen men under the command of one of these *Cossacks* (who had been *Jormac's* lieutenant) who retook the city of *Tobolsko*; where having fortify'd himself, and being recruited with fresh troops, he made such frequent excursions into the neighbouring *Tartarian* countries; that they at last grew weary of the war, and submitted to the Czar of *Muscovy*. The same fortune attended the Czar in his conquest of the kingdom and city of *Astracan*, which he made himself master of in one campaign, but he paid pretty dear for *Casán*, having been forced to raise the siege of that city, the first time, but took it in the second siege.

(5.) *The revenues of the kingdom of Siberia.*

THE Czar's revenues in this kingdom arise from the tribute of the fables, martins, red and white foxes skins, and other furs, out of which he has the fifth for his share; certain officers being appointed by the Czar for that purpose. Mr. *Fletcher*, who was *English* envoy in *Muscovy* in 1588,

affirms, that in one year there were brought into the Czar's treasury out of *Siberia*, no less than 466 *Zimmer* of sable (40 fables to each *Zimmer*) and 180 *Siberian* fox skins. The ordinary revenue of *Siberia* amounts now to 200000 *Roubles*. They have different ways of catching the fables; either by

wooden

wooden traps, not unlike our mice-traps, or by snares, which being laid under the trees where they feed, the trees are cut down, and they entangled in the snares. They

also go a sable hunting in sleds drawn by dogs, and kill them with their bows and arrows.

*The Journals of Feodor Iskowitz Backhoff from Tobolsko, the capital city of Siberia, into China, called Kattay by the Russians.*

IN the year 7162 \*, in the month of May, I left Tobolsko, pursuant to his Czarish majesty's orders, and travell'd to the city Tax upon the river Irtysh, where I arriv'd the 27th of July, having spent a month and three days in this journey. From Tax I went up the river the first of August, and for want of horses spent four weeks of my journey to the white lake, where being furnished with forty camels and fifty horses from Snablai Tzishba, or prince of the Bouchar Tartars, we left the said lake the 16th of October, and continued our journey in three weeks time to Kabalgakuna, inhabited by the Calmuck Tartars, who live in brick-houses, built after the Russian manner. From Kabalgakuna to the seven elms is two days travelling; and from thence to the rivulet of Jekusa, which arises from among the mountains, and falls into the Irtysh, another day's journey. From the river of Jekusa, along the right side of the Irtysh, to the residence of that Calmuck prince (who is a priest) residing on the left side of the said river, is three days journey. Their fields, which produce wheat, barley, and peas, are plowed by some of the Bouchar Tartars. From hence, all along the right side of the river Irtysh to Ablawich (near the Bouchar cornfields) is fourteen days journey, thro' high mountains, full of birch-trees.

We arrived at Ablawich the 22d of November, where they live in plaster'd houses; their fruits are wheat, barley, and peas; and they abound in fish. Their prince named Ablai Tzishba did invite me to his house, where after he had demanded the Czar's presents (which I gave him) he entertained me very handsomely. The 30th of November I continued my journey thro' the Bouchar Tartars, who are for the most part husbandmen, among whom I tarried four months and ten days.

The third of April 7163, I went from thence to the brook of Baika, twelve days journey from the Bouchar cornfields; near this brook the before-mentioned prince Ablai Tzishba was building for himself two houses of stone, by Chinese workmen. Here I stayed five weeks and five days.

The 30th of June, 7163, having receiv'd my passport from Ablai Tzishba, I continu'd my journey from the brook Botka to Conjaja Toucha, or Kattasching's children in four-

teen days, and in five days more to the small city of Rontashina, inhabited by Calmuck priests. From this place to the lake, through which passes the river Irtysh, is fourteen days journey.

From hence to Mijansko Tzishba, is two days journey, and from thence through the mountains seven days more. Hereabouts live the princes of the Mogul Tartars, who speak both the Mogul and Calmuck languages; there is three days journey from hence to the residence of the prince named Dobruna, whose territories extend fifteen days journey to the frontiers of China. However many petty princes have their territories interspersed here, who are also of the race of the Moguls.

From the uttermost frontiers of China to Cokatana, their first city, is a journey of three months. The mountains along the river Irtysh and the white lake to the frontiers of China, are inhabited by the Moguls and Calmuck Tartars; the first live very poorly, and I was often obliged to stay among them to furnish myself with water and provisions. After I had stayed nine days at Cokatana in expectation of two guides, we continued our journey thence the twelfth day of January 7164 to Kofki, a journey of twelve days. Hereabouts also live divers petty princes of Mogul Tartars, who call themselves Tiobertzanjky, but are under the Chinese jurisdiction. Kanki is situate among the rocks; here I saw the famous Chinese wall, being three fathoms high, and one and a half thick, fill'd up in the inside with small stones; the stone towers stand not in the same line close to the wall, but at ten fathoms distance, and are a hundred fathoms distance from one another, reaching as long as the wall to the sea-side. The 20th of February, having received orders from the king of China for the continuation of my journey, we set out the 21st from Capki, seven days journey from Cambalu, (or Pekin) having twenty eight cities lying between them, surrounded with stone walls, upon which we saw some canon, but of a small size. The soldiers that keep the guard at the gates were armed with a kind of carabines, not above half a yard long, with threefold muzzles, but without firelocks. They have generally stone-bridges built over their canals or rivulets, but have

not many rivers of note; the governors of the places are generally carried in *Palanka's* or litters, upon mens shoulders, attended by a guard on both sides.

We came to *Cambalu* the third of *March* 7164; about an *English* mile out of town, we were met by two deputies, one whereof was the chancellor of the *Pracas*, or secretary's office of the foreign affairs, the other of that of the *Chinefe* affairs. They received us in a spacious structure of stone, inhabited by some priests, and built as we were told, for the reception of the *Dalac Lama*, or the *Tartarian* high-priest, who is revered among them like a god. At the entrance of this house they desired me to alight from my horse, and to pay my respects to their king upon my knees: Unto which I replied, that it was not our custom to salute even our *Czar* upon our knees, but only with a very low bow, and bare-headed; unto which they gave no other answer, but that the *Dutch* never refused it, and therefore I ought not. They then presented me with some *Tbee*, made with cow's milk and butter, in the king's name; it being *Lent*, I refused to drink it. They told me, that I being sent from one great *Czar* to another mighty prince, I ought at least to accept it, which I did, and so returned back. As we were making our entry, I saw in the gate standing three brass cannon, and so we marched forward three *Versts*, thro' most markets, before we came to the court prepared for our reception, which had two houses of stone, hung with tapestry. Our daily allowance of provisions was one sheep and a small cask of *Spanish* brandy, two fishes, a middle-sized *Jassy*, a certain quantity of wheaten flour, *Sicbay*, and rice, and two cups of brandy. The 4th of *March* certain persons sent by the *Chinefe* king came to my lodgings to demand the presents I had brought along with me from the *Czar*; I told them, that it was not customary at our *Czar's* court to deliver the presents till we had been admitted to the audience of the king, and delivered our credentials. Unto which they replied, *One king ought not to prescribe laws to another; our customs are different from yours. Our Bogday (king) has sent us to demand the presents, but if you come to sell them, let us know your price.* I replied, That I was not sent by the *Czar* to merchandize, but to establish a friendly concurrence betwixt the two kings, and to offer him some presents. They then told me, That since I own'd I was sent with presents to their king, they would take by force

what our *Czar* had sent; and as for my credentials, care should be taken of them hereafter; and thus actually took the presents by force.

The 6th of *March* word was sent me to bring my credentials to the secretary's office; which I refused to comply with, telling the messenger that I was sent with these credentials to the king, and not to his ministers.

*August* 21, they sent again upon the same errand; but I refusing the same, they told me, That since I had disobey'd their king's command, they had orders to punish me; I gave them no other answer, but, if they cut me limb by limb, I would not part with them till I had been admitted to the king's presence.

The 31st of *August* all the presents were brought back by certain officers, who told me that it was done by special command from their king, because I had refused to deliver my credentials into the *Pracas* or secretary's office; and one among them told me, *No foreign minister, come he from what country he will, is admitted into the presence of our king, but only of his great ministers, call'd Inoanol Boyarde.* I can give you no true account of the bigness of the city of *Cambalu*, because we had no liberty to take a view of it; but if we may credit the *Moguls* and *Chinefe*, they told us it was sixty *Versts* (twelve *German* leagues) in compass. Vast quantities of silk stuffs are made and sold here, but their pearls and precious stones they have from *Karatsebo*, two months journey with camels from *Cambalu*, and then in the possession of a son of the late king. The king's palace fronts a spacious market-place, whither all sorts of people come to salute the king, at least three times a month. Every new moon they put out flags as a signal to the people to come to make their submission; and the same is done every 22d and 29th day of the month, when they appear in rich brocade'd clothes, upon their bended knees, and among the rest twenty six elephants trained up for that purpose. The *Bogday* then regent, was a *Mogul Tartar*; but the late *Chinefe* emperor, after these *Tartars* had made themselves masters of the *Chinefe* empire (about thirty years before) kill'd himself, securing only a young son, named *Young Sie*, behind two of the *Chinefe* lords carried to *Karatsebo* in old *China*. The *Chinefes* are much stronger in the city of *Cambalu* than the *Moguls*. In the year 7164, the 7th of *July*, 25 *Hollanders*, the

(\*) *Nieuwhoff* p. 181. We understand by the said facter *Adam*, that there was there a *Muscovite* embassy, with an attendance of 100 persons (among whom were some *Movers*) to treat about certain points relating to

traffic; but were not as yet admitted to audience, because the emperor refused at that time sometimes in the city, sometimes at some distance thence.

remainders of the three ships (who had each of them 100 men aboard, two whereof were lost) arrived at *Cambalu*, but for want of an interpreter could not converse with them; they gave me two letters for *Muscov*. Having obtained my passport in 7164 in *September*, I left *Cambalu*, and returned thro' the same way I came to *Muscov*, having had but ill success in my negotiation, because I would not reverence their idols (\*).

And here it is to be observed that *Cambalu* is the capital city of *China*, otherwise it is called *Peking*, the first being the name given them by the *Tartars*, whence some geographers have been mislead, who have placed *Cambalu* in their maps, in the great *Tartary*. *Tamerlane* a *Tartar* by birth, having conquered *China*, is the reason that frequent mention has been made of *Cambalu* in his history, which has introduced this error of placing *Cambalu* in *Tartary*; add to

this, that our ancient historians of *China* have call'd it *Kattay*, the same name that is given to it by the *Russians* to this day, *Kattay* being a *Tartarian* word, signifying as much as an inclosed or wall'd place, (such as *China* is) given by them to *China*, whilst they were in possession of it. And because *China* was known or first described by the ancient historians at the same time the *Tartars* were masters of it, they were easily led into that mistake, by taking the *Grand Tartary* for *China*, and so put it down accordingly in their maps, placing *Cambalu* in *Tartary*, whereas it is the same with *Peking* the capital city of the *Chinese* empire. For the same reason it is, that they have described *Tartary* as a rich plentiful country, whereas it is very mean, and above one half of it not fit for tillage. *Kattay* is indeed a *Tartarian* word, but not a name of their own country, but given by them to *China*.

(b) *Intreetta* p. 313. Speaking of this embassy: *In quos (sc. ritus) quoniam Muscovice ante biennium legatione functi conjunctim veniunt, cum dedere muneribus, quæ attulerant, redditus rejiciunt.* And *Nieuhoff* p. 187, the 14th of *September* our envoys understood that the *Muscovite* Ambassador was upon his departure, with our being admitted to audience, because he refused to bend his knees before the imperial seat, as looking upon it as a degrading to his master's honour. About noon,

just as our enjoys were at dinner, one of the said ambassador's domesticks came to take leave of us, desiring in behalf of all the rest, that we would be pleased to give them a certificate to testify that they had met with us here, which was readily granted. Afterwards we heard, that the said ambassador was stopped in the country, because he was not provided with a sufficient passport.

## A SHORT

A SHORT  
 ACCOUNT  
 OF THE  
 VOYAGES  
 OF

Mr. ZACHARY WAGENER,

Perform'd in thirty five Years,

Through *Europe, Asia, Africa and America;*

Taken out of his own JOURNAL.

**A**NNO 1633, the 3d of *June*, I left *Dresden* (my native city) with consent of parents and embarked in a small vessel upon the river *Elbe* in company of Mr. *Frederick Lebzelter*, one of the grooms of the chamber to his electoral highness of *Saxony*, for *Hamburg*, where we arrived safely some time after; but not meeting with any opportunity of preferment there, I embarked for *Amsterdam*, where I was entertained for a whole year by Mr. *William Johnson Blawe*, one of the most noted booksellers of that city; and after that, being resolved upon travelling farther, engaged my self in the service of the *West-India* company, in the quality of a private centinel, and in 1634, the 18th of *July*, embarked aboard a stout two deck'd ship, bound for *Brazil*, where we arrived after a most troublesome voyage of sixteen weeks, and came to an anchor before the *Receif*. Not long after our arrival, I was advanced to a muster-master's place in major *Bajart's* company then in garrison in the fort *Ernestus*, and sometime after was made clerk of the kitchen of his excellency count *John Maurice of Muscov*, general of *Brazil*.

Anno 1638, the 20th of *April*, the beforemention'd earl embark'd with 8000 *European* soldiers, and 3000 *Brazilians* aboard 47 ships, steering their course from

the *Receif* to the *Bay of all Saints*, in order to besiege the city of *St. Salvador*; I went along with his excellency in that expedition, which proved unsuccessful; for the city being impossible to be begirt on all sides, we returned after two months to the *Receif*. Anno 1630, I went along with the said earl to *Anthony Vaz*, by the way of the cape of *St. Austin* and *Sexinbain*, and so farther by land to *Porto Calvo*: In our return we pass'd thro' the middle of the *Dutch-Brazil*, by the way of *Bojorvegid*, to the city of *Paraiiba*, and as we pass'd along took a view of all the garisons and fortresses, so that this progress took up above, three months. After I had spent this seven years in *Brazil*, viz. three years in the service, and four in his excellency's family, I desired leave to return home, which being granted, and a passport given me, I embark'd in 1641, in *April*, aboard a vessel called the *Tiger*, bound with two other vessels freighted with sugar, tobacco and *Brazil* wood, Mr. *William Honton* commodore for *Holland*. We arrived the 17th of *January* in the *Texel*, when a man of war being then just ready to sail for *Enkhuysen*, I when aboard her, and lodged that night in the said city. The 18th, early in the morning I went by land over *Horn* to *Burmerent*, and from thence thro' the *Beemles* by water to *Amsterdam*. The 20th early

in the morning, I went in the *Tracksbuit* over *Harlem* to *Leyden*, and from thence to the *Hague* and *Delft*, where I delivered the letters and presents wherewith I was intrusted by his excellency the earl of *Nassau*.

But having a longing desire to see my native country, I set out from *Amsterdam*, Anno 1641, the 14th day of *August*, and taking my way over *Harlem*, thro' *Friseland*, arrived safely at *Hamburg* the 23d, but the roads being then much infested by straggling parties, I went up the river *Elbe* as far as *Magdeburg*, where taking coach for *Leipzig*, I continued my journey afterwards from thence to *Dresden*, the place of my nativity, where I arrived the 12th of *October*, and to our mutual joy, found my parents in good health. I stayed with them about fourteen months, but not being able to comply with their manner of living, so different from what I had been used to of late years, I took a resolution (with their consent) to return into *Holland*, and to take a voyage thence into the *East-Indies*.

Accordingly in 1642, the 10th of *February*, I took shipping upon the river *Elbe*, in company of the young Mr. *Dillibius*, and the son of the count marshal, Mr. *Henry Van Tauben*, and passing down the river *Elbe*, where my fellow travellers left me, intending to continue their journey thro' *Holland* for *France*, and the river beginning to be full of ice by this time, our vessel could not get farther than *Tangermunden*, where we were forced to stay till the 2d of *March* and then went forward (tho' not without great danger of the ice) for *Hamburg*, where I arrived the 6th, and soon after agreed with a *Dutch* master of a vessel to carry me to *Amsterdam*. The 11th we set sail, and passing by *Gluckstadt*, came to an anchor near *Zell*, where going ashore, I diverted my self for a short time with one of my relations, and so went aboard again, and continued our voyage towards the *Dutch* coast. Our Master it seems was born in a certain village on the *Friseland* coast, called *Maecon*, and being seiz'd with a curiosity to see his birth-place, took this opportunity to come to an anchor near it, which proved so unprosperous, that in a few days after being surpris'd by a storm with a violent frost, I was obliged to spend thirteen days at the houle of a rugged *Friseland* country fellow, whose language I did not understand. All the comfort I had was to take this opportunity to go to *Franeker*, an university in those parts; and after my return the tempest being laid, we set sail again the 26th, and arrived the 28th at *Eukbuiscu*, where changing my vessel for another, I came the 29th early in the

morning to *Amsterdam*; here I received the unwelcome news that the ships wherewith I intended to have sailed to the *East-Indies*, were already gone some days before, and that the next were not to sail till *August*; being afraid that my money would scarce hold out till that time, I was forced to take a journey into *Norib-Holland*, to expect the coming of their *East-India* ships, wherewith I returned afterwards. Anno 1642, the 10th of *May* we came to an anchor with nine ships before the *Texel*, where in two months after, we saw ten ships richly freighted, Mr. *Francis Caron* commodore, and came along with them in *August* into *Holland*.

Having in vain endeavoured, by the interest of Mr. *Beirnbellen* to get an assistant's place in the chamber of *Amsterdam*, I was forced to take up with a *Cade's* place, at the rate of ten *guilders* per month; and being furnished with recommendatory letters to the regency of *Batavia*, I sail'd out of the *Texel* the 29th of *September*, in a new vessel call'd the *Swan*, in company of two others; and having refreshed ourselves at the *Ile of Wight*, (belonging to *England*) and in the *isle of St. Vincent*, we came in 1643, the 17th of *April*, safely to an anchor in the road of *Batavia*, having outstrip'd the two others, that were no such failers as ours. After I had stay'd here for some time, the then governor-general *Anthony Van Diemen* removed me from the military service to an assistant's place worth 20 *guilders* per month. Anno 1647, the 20th of *May*, Mr. *Cornelius Vander Lyn*, his successor, bestow'd upon me one of the head clerks places worth 28 *guilders* per month, besides six *Reals* board wages: Anno 1648, I being then in the 35th year of my age, married at *Batavia* a certain widow born in the city of *Wesel*, named *Mary*, the relict of Mr. *Aux Brebis*, who then lived with the head factor, Mr. *James S. buern*. Anno 1649, the 29th of *September*, the said governor-general Mr. *Van Lyn*, was pleas'd to bestow upon me the employment of a factor (besides my clerks place) for five years, with a monthly salary of 56 *guilders* per month, and 13 *reals* board wages.

Anno 1650, I was sent in an open chaloop from *Batavia* to the *Straits of Sundra*, *Thys Crab* commander, to fetch certain instructions, which Mr. *Maximilian le Maire* (who was lately arrived there with the ship the *Walvisch* from *Holland*) had brought along with him; but before we reach'd the said vessel, we met the ship the *Nassau*, coming from the western coast of *Sumatra*, laden with pepper, and being willing to speak with them, by the carelessness of our master the chaloop run so violently against the

poop of the ship, that it was ready to sink; I did endeavour to lay hold of the lion's head of the great ship, but missing my aim, fell into the water, where I narrowly escaped being drowned; for the ship being under sail, I got under her, and with much ado got upon the other side (yet not without being forely cut by the mussel-shells that stuck to the bottom) from whence, with much ado they dragged me up with a rope into the ship. Afterwards it being resolved to send me along with Mr. *William Versteegen*, extraordinary councillor of the Indies, and commissary of the northern quarter, from *Tonquin* to *Tabwan*, my salary was raised to 66 guilders per month.

Anno 1651, the 20th of April, we embarked aboard the *Delfsbaven* yacht at *Batavia*, in order to prosecute this intended voyage, which having been accomplish'd with good success, we stop'd in our return near the kingdom of *Quinam*, and after having settled a firm peace with that king, and obtained the releasement of our prisoners, we came to an anchor again in the road of *Batavia*, the last day of December, where in a few days after my arrival, I was constituted a member of the council of justice by Mr. *Reimerjon*, then governor-general in the absence of Mr. *Lyn*.

Anno 1653, the 14th of July, the time of my former contract being expired, I engaged myself again in the companies service for three years longer, at the rate of 85 guilders per month; I was soon after as commissary or envoy of the company sent with two yachts the *Shellfish* and the *Brownfish* to *Kanton* in *China* (\*) to endeavour the establishment of a free commerce for our company there, with the *Tartarian* viceroy; but the *Tartarian* commanders aiming at nothing but our money, and little to be relied upon, I left these covetous wretches,

and made the best of my way with my two yachts towards *Tonquin*, where having left the *Brownfish* to rest, I returned, notwithstanding I was very dangerously ill, with the *Shellfish* alone the 29th of December to *Batavia*. Having immediately after my recovery, given an account of my negotiation, I had soon after a place assign'd me in the council of justice.

Anno 1656, the 12th of July, I was sent in the quality of director in the ship call'd the *Calf* to *Japan*, (†) to relieve according to custom, Mr. *John Bricklinus*, his year being expired; where I arrived the 18th of August, and immediately delivered the presents sent by the company to the emperor, but had scarce been here three days when on the north-side of the capital city of *Yedo*, a sudden fire broke out, which being increased by a violent wind, laid not only the whole city (which might for its bigness be compared to a whole province) in ashes in 48 hours, but also consumed the royal palace and near 160000 souls; however we had the fortune to escape the fury of the flames thro' God's mercy, tho' not without a great deal of danger.

Anno 1657, the 27th of October, I returned out of *Japan* (†) in the ship the *Flower-Valley*, in company of the head factor, Mr. *John Betgens*, who had received orders to go and reside at *Tajapan* in the quality of deputy-governor to Mr. *Coyett*; we were put to no small trouble to get into the road of that place, where having stay'd six days, I set sail again thence, in company of the *Hercules* and the *Watchman*, and came safely before *Batavia* the 18th of December, where we found several Dutch ships (which on the 31st returned for *Holland*, under the command of Mr. *John Cananus*) riding at anchor.

Anno 1658, being ready to go a second

(\*) Of this voyage *Nieuhoff* p. 29. Hereupon it was resolved to send as commissioners Mr. *Schedel* and Mr. *Wagner*, the first in the *Brownfish*, the other in a vessel call'd the *Shellfish*. They set sail together from *Batavia*, and after a voyage of four weeks, came to the western point of *Haitan*. From whence they went up the river *Kanton*, as far as *Wangse*, three leagues distance from *Kanton*, where having staid for some time, but in vain, in expectation of the *Mandarins* to conduct them to *Kanton*; Mr. *Schedel*, without leave from the regency of *Kanton*, and against the advice of the interpreters, went to see his old friend *Haitan*, in whom he much confided; being directed by him to go to see *Taurant*, he did accordingly, but finding neither him nor his secretary at home, was forced to come aboard again immediately, as not knowing where to lodge all that night.

The same *Nieuhoff* p. 32. Mr. *Wagner* finding all his courtships to the *Mandarins* of no effect, he returned with both the yachts to *Batavia*, he having not with all his cunning, been able to settle a commerce there for his countrymen: What vexed him most was, that these avaricious wretches had the impudence to demand to wait a sum of money, only to procure the

reception of his letters, by the viceroy, without the least promise of entering afterwards into a conference upon the proposed commerce.

(†) Concerning this commission, *Arnold Montan* says, p. 356. Next to this the embassy performed by Mr. *Zachary* of *Mynia*, is no less remarkable; and p. 369. speaking of this conflagration: Mr. *Wagner* returning early in the morning into the city, found the whole southern part of it in a flame; About noon the fire got into the imperial palace, with such violence, that in an instant the strong towers and stone watch-houses were seen tumbling into the ditch, where the fire stop'd on that side; but continuing on the other hand, the emperor's lodgings were consumed before the night, he having scarce time given him to retire with his chief councillors to their summer-houses, built on the north-side at some distance from the palace; in short, in two days time above 100000 houses were laid in ashes, inhabited before the fire by 1000000 of souls, together with a vast number of most stately palaces, and pagodes or pagan temples.

(‡) The same *Montan*, p. 377. In the meanwhile Mr. *Wagner* taking a short voyage to *Batavia*, soon returned to prepare for his second intended embassy to *Japan*. Anno 1659, he had made all the necessary preparations for it.

reparations for it.

time

time as director to Japan, to take care of  
the company's interest there, Mr. John Mac-  
zucker, who succeeded Mr. Reymers as go-  
vernor-general, was pleased to appoint me  
100 guilders per month, without any limit-  
ed time; I embark'd immediately after  
aboard the ship call'd the *Venenburgh* at  
*Batavia*, and set forward with a prosperous  
gale till August, when being among the  
*Maccauske* islands upon the Chinese coast,  
we were overtaken by so violent a tempest,  
that we expected every moment to be dash-  
ed against the rocks, but thro' God's mercy  
this storm lasted not above twelve hours;  
after which the wind proving pretty favour-  
able, we continued our voyage, and the  
17th of September arrived safely in the bay  
of *Nangasacka*. Our commerce in Japan  
being establish'd upon a good foot, and all  
other matters settled to our satisfaction, I  
began to prepare for my return to *Batavia*;  
and in 1659, set sail in the ship called the  
*Harversen*, from the bay of *Nangasacka*; but  
the master of our vessel being not well ac-  
quainted in those seas, we got one night  
among the rocks *de Paradies* (a branch of  
the sea, formerly part of the continent,  
but swallow'd up by the waves) I was  
no sooner awake the next morning, but  
seeing ourselves among these rocks, and  
that we had missed the entrance of the  
*Streight of Banca*, I gave myself over for  
lost, and certainly had been so, if by the  
indefatigable labour of the seamen, and a  
favourable gale, we had not made shift to  
get the 20th of December into the harbour  
call'd *Paulofingen*, where we were forced to  
stay four days before we could get out to  
make the said streight, from whence we  
failed without any sinister accident to *Ba-  
tavia*.

Anno 1660, the 22d of August, Mr. Ja-  
cob Carack, and I were sent as commission-  
ers to *Macassar* in the *Postilion* yacht, to  
treat with the king concerning a peace,  
pursuant to the instructions given us for  
that purpose.

The 12th of November I returned alone  
in the same vessel, in order to give an ac-  
count of my negotiation there, Mr. Carack  
being obliged to stay behind about some  
business of moment in our fortrefs of *Pan-  
neballa*.

In the beginning of the year 1661, be-  
ing without employment, I thought fit to  
accept of the surveyorship over the build-  
ings, vacant by the death of Mr. John Li-  
fingen, whereby I a third time obtained a  
place in the council of justice; but finding  
this office too burthensome for my gouty  
carcass, which was not able to endure such  
continual going from place to place, I quit-  
ted that employment, and in lieu thereof

was ordered to relieve the commander in  
chief on the *Cape of Good-Hope*, Mr. John  
*Van Riebeck*, who was to have been succeed-  
ed by Mr. *Gent Van Hoom* but he dying in  
his voyage thither, I was pitch'd upon to  
supply his place. Accordingly I left *Bata-  
via* Anno 1662, the 30th of January, with  
all my family, and with two ships in sixteen  
days time, with a prosperous gale, came in  
sight of the cape or utmost point of *Africa*.  
As I was entering the bay, we heard the  
unwelcome news, that of the seven ships  
we saw at anchor before *Batavia*, and part-  
ed thence about a month before us, four  
were lost in a storm near the island of St.  
*Maurice*.

Anno 1663, in February I received let-  
ters out of Holland from the governors of  
the company, wherein they not only con-  
firm'd me in my governors place here, but  
also appointed me the same allowance my  
predecessor had enjoy'd.

Anno 1664, being advertised by several  
letters sent to me over land from the bay  
of *St. Helens*, by captain *Henry Van Wallen*,  
intimating that a conspiracy had been disco-  
vered in the ship call'd the *Arms of Horn*,  
and that he had been obliged to take into  
custody the master of the ship and another  
officer; I embark'd the next day with  
three horses, aboard the ship called the  
*Watercock*, but not being able to go be-  
yond the cape of *Satanbia*, I landed there,  
with two servants on horse-back, continu-  
ed my journey thither by land; but were  
no sooner arrived there, when being in-  
form'd by the *Hottentots* (inhabitants of the  
cape) that the said ship was failed thence  
the day before towards the cape; we were  
forced to make the best of our way back  
to the bay of *Satanbia*, where we arrived  
the 3d day, but to our great regret,  
found that the captain had again quitted  
his first station there, and was gone up  
two leagues farther into the bay; so that  
we saw ourselves under an absolute neces-  
sity to take up our resting place all that  
night upon the ground near the sea-shore  
but were not a little surpris'd, when the  
next morning we discovered in the land  
the foot-steps of a great lion that had pas-  
sed but a few paces from us, without doing  
us any harm.

After my return to the cape, viz. Anno  
1666, my wife, after a month's sickness,  
departed this life, after I had lived with  
her in marriage 18 years and four months,  
but had no children by her; I ordered a  
small chapel to be built on the cape, where-  
in she was interred. Not many months  
after, viz. the 16th of September Mr. *Corne-  
lius Van Quaalbergen*, who was sent in the  
ship the *Dordrecht* to succeed me in my com-  
mand,

mand, arrived at last on the cape, after a most tedious and troublesome voyage of eight months, in which they had lost 190 men by the scurvy and other distempers. Having pursuant to the orders sent me by the council of seventeen, given the said Mr. *Quellbergen*, all the necessary instructions, and surrendered the government into his hands, I embark'd with all my moveables the 1st of *October*, in the before-mentioned ship the *Dordrecht*, together with my daughter-in-law, whose name was *Mary Buequi*, the relict of *Cornelius Vorburgh*, one of the head factors of the company, and with a very moderate and prosperous wind, arrived safely at *Batavia*, where being lodged at Mr. *John Balan's* house, she and I shared the inheritance of her mother, according to the determination of two arbitrators chosen for that purpose.

Anno 1667, the 1st of *September* I embark'd at *Batavia* in the ship called the *Erebus*, being sent as an envoy of the companies to the emperor of great *Java* or of *Materan*, with two very fine *Persian* herbes, besides other presents to renew the ancient friendship, and good neighbourly correspondence betwixt them; we came to an anchor near the river *Samaran*, where leaving our ship, we travell'd in six or seven days to the capital city *Materan*, where having discharged my commission, I return'd from thence by land, with a numerous attendance to *Samaran*, and from thence set sail towards *Japan*, where having stayed a few days to dispatch some business of moment, we embarked, and arrived the last day of *November*, with the same yacht, we came in from *Batavia* in that road, where I gave an ample account of my transactions to the great council of the *Indies*.

Having by this time spent twenty five years in the *East-India* company's service, I took a full resolution to return to my native country, for which reason having desired my discharge from the just now mentioned council, the governor-general, Mr. *Maetzucker*, would fain have prevailed upon me to continue there for some time longer, offering me his garden-house without the gate of *Batavia* for my habitation.

But being resolved to return to my native country, I was forced to refuse his kind offer, and having obtained my passport, I left *Batavia* in 1667, the 8th of *December*, with a Squadron of six ships, whereof *John Vander Lahn* was admiral, and my self carrying the vice-admiral's flag aboard the ship call'd the *Arms*, bound for *Middleburg* on account of the chamber

of *Zealand*. Having happily pass'd the *Straits of Sunda*, we arrived Anno 1668, the 22d of *February*, with fair wind and weather, in the *Table-Bay* of the cape of *Good-Hope*, where to our great satisfaction we received the news of the late concluded peace betwixt his *Britannick* majesty and the states-general at *Breda*.

Whilst we lay at anchor here, four more ships that were left behind at *Batavia* to take in their cargo, arrived likewise in the said bay the 10th of *March*; as also not long after, the ship called *Thuis de Telsen*, being sent from the chamber of *Amsterdam*, having aboard fourteen conspirators, (for the most part northern country men) who had laid a plot to kill the captain and the other officers of their ship, whilst they were at dinner, and afterwards to seize the vessel; five of the ringleaders of them were sentenced to be hanged on a gibbet near the fort; seven others to be whip'd and burn'd with a red hot iron, and the rest to be kept in irons for their life-time, and to work in such places as should be appointed by the company, which was put in execution accordingly. Anno 1668, the 26th of *March* we set sail from the *Table-Bay* with the whole fleet, consisting of ten ships richly laden, viz. the *Holland Hayn*, the *Arms of Middleburgh*, the *Dordrecht*, *Liberty*, *Amerongen*, *Cattenburgh*, the *Spreew*, *Outshorn*, the *Tiger* and the *Young Prince*; and taking our course betwixt the continent and the *Red-Island*, pass'd the *Green-Sea*, and so with a prosperous gale continued our voyage till the month of *July*, when we arrived happily in *Holland*.

N. B. Mr. *Zachary Wagener*, being in the month of *July* arrived with ten ships as vice-admiral in *Zealand*, found himself so much indispos'd, that after some stay at *Middleburgh*, he thought fit to go to *Amsterdam*, to take the advice of the physicians of that city; and having accordingly taken up his quarters at the sign of the city of *Prague*, in the *Warmer-street*, nothing was left unattempted to remove the indisposition of his body; which notwithstanding all the endeavours of the best physicians not availing, he died the 1st of *October* 1668, and was inter'd the 6th following, in the *Old Church* of *Amsterdam*. He was then 54 years old and four months, the greatest part of which he had spent in travelling by sea and land; having spent seven years in *Brasil*, and served the *Dutch East-India* company no less than 25 years.

## Author's Preface.

**I** Being the son of the admiral Christopher Columbus, a person worthy of eternal memory, who discovered the West-Indies; and having myself sail'd with him some time, it seem'd to me but reasonable, that among other things I have writ, one and the chiefest should be his life, and wonderful discovery of the West-Indies, or New-World; because his great and continual sufferings, and the distempers he laboured under, did not allow him time to form his notes and observations into a method fit for history; yet knowing there were many others who had attempted this work, I forebore, till reading their books I found in them, that which is usual among historians, viz. that they magnify some things, lessen others, and sometimes pass that over in silence, which they ought to give a very particular account of. For this reason I resolv'd to undergo the labour of this task, thinking it better I should lie under the censure my skill and presumption shall be subject to, than to suffer the truth of what relates to so noble a person to lie buried in oblivion. For it is my comfort, that if any fault be found in this my undertaking, it will not be that, which most historians are liable to, viz. that they know not the truth of what they write; for I promise to compose the history of his life of such matter only as I find in his own papers and letters, and of those passages of which I myself was an eye-witness. And whoever shall imagine, that I add any thing of my own, may be assured I am satisfied, I can reap no benefit thereby in the life to come; and that the reader alone will have the benefit of it, if it be capable of yielding any.

The author having given this account of himself, I have not much to add, but to inform the reader before he enters upon the work, that in it he will find all the reasons which induced the admiral to such an undertaking; he will see how far he proceeded in person upon the discovery in four several voyages he made; how great and honourable the articles were, upon which he entered upon the discovery, and which were afterwards confirm'd to him by those two famous princes, king Ferdinand and queen Isabel or Elizabeth; how basely they were all violated; and he, after such unparalleled services, most inhumanly treated; how far he settled the affairs of the island Hispaniola, the first place the Spaniards planted in; what care he took that the Indians should not be oppress'd, but rather by good usage and example, prevail'd upon to embrace the Catholick faith; also the customs and manners of the Indians; their opinions and practice as to religious worship; and in a word, all that can be expected in a work of this nature, the foundation whereof was laid by so great a man as was the admiral, and finish'd by his own son, who had all the education that could contribute to make him capable of writing so notable a life.

THE  
DISCOVERY  
OF THE  
*WEST-INDIES,*

BY

CHRISTOPHER COLUMBUS,

Together with his

LIFE and ACTIONS, &c.

CHAP. I.

*Of the country, original, and name of admiral Christopher Columbus.*

Colum-  
bus's ori-  
ginal.

IT being a very material point in the history of any man of note, to make known his country and original, because they are best look'd upon, who are born in noble cities and of illustrious parents; therefore some would have had me spent my time in shewing that the admiral was honourably descended, tho' his parents, thro' the peevishness of fortune, were fallen into great poverty and want; and that I should have proved they were the offspring of that *Junius Colon*, of whom *Tacitus* in his 12th book says, That he brought king *Mithridates* prisoner to *Rome*; for which service the people assign'd him the consular dignity, the eagle or standard and consular court. And they would have me give a large account of those two illustrious *Coloni*, his predecessors, who, *Sabellicus* tells us, gained a mighty victory over the *Venetians*, as shall be mention'd in the 5th chapter: But I refused to undertake that task, believing he was particularly chosen by Almighty God for so great an affair as that was he performed; and because he

was to be so truly his apostle as in effect he proved it was his will he should in this part be like the others, who were called to make known his name from the sea and rivers, and not from courts and palaces, and to imitate himself, whose progenitors being of the blood royal of *Jerusalem*, yet it pleas'd him that his parents should not be much known. Therefore, as God gave him all the personal qualities for such an undertaking, so he would have his country and original more hid and obscure. So it is that some, who would cast a cloud upon his fame, say he was of *Nervi*, others of *Cugureo*, and others of *Bugiesco*, all small towns near the city of *Genoa*, and upon its coast. Others, who were for exalting of him say, he was a native of *Savona*, others of *Genoa*; others more vain, make him of *Piacenza*, in which city there are some honourable persons of his family, and tombs with the arms and inscriptions of the family of *Columbus*; this being then the usual surname of his predecessors; tho' he complying with

His Name.

the

THE

the country whither he went to live, and begin a new state of life, modelled the word, that it might be like the ancient, and distinguished the direct from the collateral line, calling himself *Colon*. This made me apt to believe, that as most of his affairs were guarded by some special providence, so this very particular, concerning his name and surname, was not without some mystery. We may instance many names which were given by secret impulse, to denote the effects those persons were to produce, as in his is foretold and expressed the wonder he performed. For if we look upon the common surname of his ancestors, we may say he was true *Columbus* or *Columba*, for as much as he convey'd the grace of the Holy Ghost into that new world which he discovered, shewing those people who knew him not, which was God's beloved son, as the Holy Ghost did in the figure of a dove at St. *John's* baptism; and because he also carried the olive branch and oil of baptism over the waters of the ocean, like *Noah's* dove, to denote the peace and union of those people with the church, after they had been shut up in the ark of darkness and confu-

sion. And the surname of *Colon* which he reviv'd, was proper to him, which in *Greek* signifies a member, that his proper name being *Christophor*, it might be known he was a member of Christ, by whom salvation was to be convey'd to those people. Moreover, if we would bring his name to the *Latin* pronunciation, that is *Christophorus* *Colonus*; we may say, that as St. *Christophor* is reported to have bore that name, because he carried Christ over the deep waters, with great danger to himself, whence came the denomination of *Christophor*; and as he convey'd over the people whom no other could have been able to carry; so the admiral, *Christophorus* *Colonus*, imploring the assistance of Christ in that dangerous passage, went over safe himself and his company, that those *Indian* nations might become citizens and inhabitants of the church triumphant in heaven; for it is to be believ'd, that many souls, which the devil expected to make a prey of, had they not pass'd through the water of baptism, were by him made inhabitants and dwellers in the eternal glory of heaven.

## CHAP. II.

*Of the admiral's father and mother, and their quality, and of the false account one Justiniani gives of his employ, before he had the title of admiral*

*No certainty of Columbus's parentage.*

NOT to go upon the etymology, derivation and meaning of the word admiral; but to return to the quality and persons of his progenitors; I say, that how considerable soever they were, being reduced to poverty and want by the wars and factions in *Lombardy*; I do not find after what manner they lived, tho' the admiral himself in a letter says, that his ancestors and he always traded by sea. For my farther information in this particular, as I pass'd thro' *Cugureo*, I endeavoured to receive some information from two brothers of the *Columbi*, who were the richest in those parts, and reported to be somewhat a kin to him; but the youngest of them being above 100 years old, they could give me no account of this affair. Nor do I think that this is any dishonour to us who descend from him, because I think it better that all the honour be deriv'd to us from his person, than to go about to enquire whether his father was a merchant or a man of quality, that kept his hawks and hounds; whereas it is certain there have been a thousand such in all parts, whose memo-

ry was utterly lost in a very short time among their neighbours and kindred, so as it is not known whether there ever were any such men. But I am of opinion that their nobility can add less lustre to me, than the honour I receive from such a father. And since his own honourable exploits made him not stand in need of the wealth of his predecessors, (who notwithstanding their poverty, were not destitute of virtue, but only of fortune) he ought at least by his name and worth, to have been raised by authors above the rank of mechanics and handicrafts. Which yet, if any will affirm, grounding his assertion on what one *Augustin Justiniani* writes in his chronicle; I say, that I will not set my self to deny it, begging time or means to prove the contrary by testimonials; for as much as *Justiniani's* writing it does not make that to be look'd upon as an article of faith, which is no longer in the memory of man; so neither will it be thought undeniable, should I say I received the contrary from a thousand persons. Nor will I show his falsehood by the histories others have

*Justiniani's chronicle.*

Colon which he which in Greek s proper name be known he y whom salva- to those people. ng his name to is *Chriſtophorus* as *St. Chriſto-* ore that name, over the deep himſelf, whence *Chriſtopher*; and eople whom no to carry; ſo the *mus*, imploring that dangerous himſelf and his nations might abitants of the ven; for it is y ſouls, which ke a prey of, h the water of ade inhabitants l glory of hea-

admiral

ry ſhort time a- and kindred, ſo there ever were of opinion that ſis luſtre to me, from ſuch a fa- honourable ex- in need of the (who notwith- not deſtitute tute) he ought worth, to have ve the rank of s. Which yet, ing his aſſertion *Justini-* iani writes in his will not ſet my me or means to cimonials; for as ing it does not pon as an article r in the memory be thought un- ceived the con- ſions. Nor will e hiſtories others have

*False-  
Justi-  
niani's  
hiſtory.*

have writ of *Chriſtopher Columbus*, but by this ſame author's testimony, and writing, in whom is verified the proverb, *that lyers ought to have good memories*, becauſe other- wiſe they contradict themſelves, as *Justini- ani* did in this caſe; ſaying in his com- pariſon of the four languages, upon that expreſſion of the pſalm, *in omnem terram exiit ſonus eorum*, theſe very words. This *Chriſtopher Columbus* having in his tender years attain'd ſome elements of learning, when he came to manly years, applied him- ſelf to the art of navigation, and went to *Liſbon in Portugal*, where he learn'd coſ- mography, taught him by a brother of his who there made ſea charts; with which improvement, and diſcourſing with thoſe that fail'd to *S. George de la Mira* in *Africk*, and his own reading in coſ- mography, he entertain'd thoughts of fail- ing to thoſe countries he diſcover'd. By which words it appears, that he follow'd no mechanic employment, or handicraft; ſince, he ſays, he employ'd his childhood in learning; his youth in navigation and coſmography, and his riper years in diſ- coveries. Thus *Justiniani* convinces him- ſelf of falſhood, and proves himſelf an in- conſiderate, raſh, and malicious country- man; for when he ſpeaks of a renowned perſon who did ſo much honour to his country, whoſe hiſtoriographer *Justiniani* made himſelf, tho' the admiral's parents had been very mean, it had been more de- cent, to ſpeak of his origin, as other au- thors in the like caſe do; ſaying he was of low parentage, or come of very poor friends, than to uſe injurious words, as he did in his pſalter; and afterwards in his chronicle, falſly calling him a mechanick. And ſuppoſing he had not contradicted him- ſelf, reaſon it ſelf made it appear, that a man, who had been employ'd in art manu- al or handicraft, muſt be born and grow old in it to become a perfect maſter; and that he would not from his youth have travelled ſo many countries, as alſo that he would not have attained ſo much learning and knowledge, as his actions demonſtrate he had, eſpecially in thoſe four principal ſciences required, to perform what he did, which are, aſtrology, coſmography, geo- metry and navigation. But it is no won- der that *Justiniani* ſhould dare to deliver an untruth in this particular, which is hidden, ſince in affairs well known concerning his diſcovery and navigation, he has infered above a dozen falſhoods in half a ſheet of paper in his pſalter, which I ſhall briefly hint at without ſtaying to give him an an- ſwer, to avoid interrupting the ſeries of the hiſtory, ſince by the very courſe of it, and what others have writ on that ſubject, the

Vol. II.

falſhood of his writing will be made out. The firſt therefore was, that the admiral went to *Liſbon* to learn coſmography of a brother of his own that was there; which is quite contrary, becauſe he liv'd in that city before, and taught his brother what he knew. The ſecond falſhood is, that at his firſt coming into *Caſtile*, their catholic majesties *Ferdinand*, and *Iſabel*, or *Eli- zabeth* accepted of his propoſal, after it had been ſeven years bandy'd about and re- jected by all men. The third, that he ſet out to diſcover with two ſhips, which is not true, for he had three caravals. The fourth, that his firſt diſcovery was *Hip- paniola*, and it was *Guarabani*, which the ad- miral called *S. Salvador*, or *S. Saviour*. The fifth, that the ſaid iſland *Hippaniola* was inhabited by *Canibals*, that eat men's fleſh; and the truth is, the inhabitants of it were the beſt people, and moſt civiliz'd of any in thoſe parts. The ſixth, that he took by force of arms, the canoe, or *Indian* boat he ſaw, whereas it appears that he had no war that firſt voyage with any *Indian*, and continued in peace and amity with them till the day of his departure from *Hippaniola*. The ſeventh, that he re- turn'd by way of the *Canary* iſlands, which is not the proper way for thoſe veſſels to return. The eighth, that from the ſaid iſland he diſpatch'd a meſſenger to their majesties aforeſaid, whereas it is certain, that he was not firſt at that iſland, as was obſerv'd, and he himſelf was the meſſen- ger. The ninth, that the ſecond voyage he return'd with twelve ſhips, and it is mani- feſt he had ſeventeen. The tenth, that he arrived at *Hippaniola* in twenty days, which is a very ſhort time to reach the neareſt iſlands, and he perform'd it not in two months, and went to others much farther diſtant. The eleventh, that he preſently made from *Hippaniola* with two ſhips, and it is known there were three he took to go from *Hippaniola* to *Cuba*. *Justiniani's* twelfth falſhood is, That *Hip- paniola* is four hours diſtant from *Spain*, and the admiral reckons it above five. And farther, to add a thirteenth to the dozen, he ſays, the weſtern point of *Cu- ba*, is ſix hours diſtant from *Hippaniola*, making it further from *Hippaniola* to *Cuba*, than from *Spain* to *Hippaniola*. So that by his negligence and heedleſſneſs, in being well inform'd and writing the truth of theſe particulars, which are ſo plain, we may plainly diſcern what inquiry he made into that which was ſo obſcure, wherein he contradicts himſelf, as has been made appear. But laying aſide this controver- ſy, wherewith I believe I have by this time tired the reader, we will only add,

6 N

that

## The first Discovery of

that considering the many mistakes and falshoods found in the said *Justinian's* history, and psalter, the senate of *Genoa* has laid a penalty upon any person that shall read or keep it; and has caus'd it to be carefully fought out in all places it has been sent to, that it may by publick decree be destroy'd and utterly extinguish'd. I will return to our main design, concluding with this assertion, that the admiral was a man of learning and great experience; that he did not employ his time in handicraft or mechanick exercises, but

in such as became the grandeur and renown of his wonderful exploits, and will conclude this chapter with some words taken out of a letter he writ himself to prince *John of Castile's* nurse, which are these.

*I am not the first admiral of my family, let them give me what name they please; for when all is done, David, that most prudent King, was first a shepherd, and afterwards chosen king of Jerusalem, and I am servant to that same Lord, who rais'd him to such dignity.*

### CHAP. III.

#### *Of the admiral's person, and what sciences he learn'd.*

*The admiral described.*

THE admiral was well shap'd, and of a more than middling stature, long visag'd, his cheeks somewhat full, yet neither fat nor lean; he had a hawk nose, his eyes white, his complexion white, with a lovely red: In his youth his hair was fair, but when he came to thirty years of age, it all turn'd grey. He was always modest and sparing in his eating, drinking, and his dress. Among strangers he was affable, and pleasant among his domesticks, yet with modesty and an easy gravity. He was so strict in religious matters, that for fasting and saying all the divine office, he might be thought profess'd in some religious order. So great was his aversion to swearing and cursing, that I protest I never heard him swear any other oath, but by *S. Ferdinand*; and when in the greatest passion with any body, he would vent his spleen by saying, *God take you for doing or saying so.* When he was to write, his way of trying his pen

was by writing these words, *Jesus cum Maria sit nobis in via*, and that in such a character, as might very well serve to get his bread. But passing by other particulars of his actions and manners, which may be mention'd at their proper time in the course of this history; let us proceed to give an account to what science he most addict'd himself. In his tender years he apply'd himself so much to study at *Pavia*, as was sufficient to understand cosmography; to which sort of reading he was much addict'd, for which reason he also apply'd himself to astrology and geometry, because these sciences are so link'd together, that the one cannot subsist without the other: And because *Ptolemy* in the beginning of his cosmography, says, that no man can be a good cosmographer unless he be a painter too; therefore he learn'd to draw, in order to describe lands, and set down cosmographical bodies, plains or rounds.

### CHAP. IV.

#### *How the admiral employ'd himself before he came into Spain.*

*Testimonies out of Columbus's own writings.*

THE admiral having gain'd some insight in sciences, began to apply himself to the sea, and made some voyages to the east and west; of which and many other things of those his first days, I have no perfect knowledge, because he died at such time as I being confin'd by filial duty, had not the boldness to ask him to give an account of things; or to speak the truth, being but young, I was at that time far from being troubled with such thoughts. But in a letter writ by him in the year 1501, to their catholick majesties, to whom he

durst not have writ any thing but the truth; he has these following words.

Most serene princes, "I went to sea very young, and have continued it to this day; and this art inclines those that follow it, to be desirous to discover the secrets of this world; it is now forty years that I have been failing to all those parts, at present frequented; and I have dealt and conversed with wise people, as well clergy as laity, *Latins, Greeks, Indians* and *Moors*, and many others of other sects; and our Lord has been favourable to this

"my

" my inclination, and I have received of  
 " him the spirit of understanding : He has  
 " made me very skilfull in navigation,  
 " knowing enough in astrology, and so  
 " in geometry and arithmetick. God hath  
 " given me a genius and hands apt to  
 " draw this globe, and on it the cities, ri-  
 " vers, islands and ports, all in their pro-  
 " per places. During this time I have seen,  
 " and endeavoured to see, all books of co-  
 " mography, history and philosophy, and  
 " of other sciences ; so that our Lord has  
 " sensibly opened my understanding, to the  
 " end I may sail from hence to the *Indies*,  
 " and made me most willing to put this in  
 " execution. Fill'd with this desire, I came  
 " to your highnesses. All that heard of my  
 " undertaking, rejected it with contempt  
 " and scorn. In your highnesses alone,  
 " faith and constancy had their feat." In  
 " another letter written from *Hispaniola*, in  
 " January 1495, to their catholick majesties,  
 " telling them the errors and mistakes com-  
 " monly made in voyages and piloting ; he  
 " says thus, " It happened to me that king  
 " *Rencee*, whom God has taken to himself,  
 " sent to me to *Tunis* to take the galeasse  
 " call'd *Fernandina* ; and being near to the  
 " island of *St. Peter* by *Sardinia*, I was told  
 " there were two ships and a barack with  
 " the said galeasse, which discompos'd  
 " my men, and they resolv'd to go no far-  
 " ther, but to return to *Marseilles* for ano-  
 " ther ship and more men ; and I perceiv-  
 " ing there was no going against their wills,  
 " without some contrivance, yielded to their  
 " desires, and changing the point of the  
 " needle, set sail when it was late, and next  
 " morning at break of day, we found our  
 " selves near cape *Cartegna*, all aboard  
 " thinking we had certainly been sailing for  
 " *Marseilles*." In the same manner in a  
 " *Memorandum*, or observation he made to  
 " show, that all the five zones are habitable,  
 " and proving it by experience in navigation,  
 " he says, " In *February* 1467, I sail'd my self  
 " an hundred leagues beyond *Tbule*, *Island*,  
 " whose northern part is 73 degrees distant  
 " from the equinoctial, and not 63 degrees  
 " as some will have it to be ; nor does it lie

" upon the line where *Ptolemy's* west begins,  
 " but much more to the westward ; and to  
 " this island which is as big as *England*, the  
 " *English* trade, especially from *Bristol*. At  
 " the time when I was there, the sea was  
 " not frozen, but the tides were so great,  
 " that in some places it swell'd 26 fathoms,  
 " and fell as much." The truth is, That  
 " the *Tbule* *Ptolemy* speaks of, lies where he  
 " says, and this by the moderns is call'd *Friz-  
 land*. And then to prove that the equino-  
 " ctial or land under it is habitable, he says,  
 " I was in the fort of *St. George de la Mira*  
 " belonging to the king of *Portugal*, which  
 " lies under the equinoctial, and I am a wit-  
 " ness that 'tis not uninhabitable, as some  
 " would have it." And in his book of his  
 " first voyage, he says, " He saw some mer-  
 " maids on the coast of *Menegueta*, but that  
 " they are not so like ladies, as they are  
 " painted." And in another place he  
 " says, " I observed several times in sailing  
 " from *Lisbon* to *Guinea*, that a degree on  
 " the earth, answers to 56 miles and two  
 " thirds." And farther he adds, " That  
 " in *Scio*, an island of the *Archipelago*, he  
 " saw mastick drawn from some trees." In  
 " another place he says, " I was upon the sea  
 " 23 years, without being off it any time  
 " worth the speaking of ; and I saw all the  
 " east and all the west, and may say towards  
 " the north, or *England*, and have been at  
 " *Guinea* ; yet I never saw harbours for  
 " goodness, like those of the *West-Indies*." And a little farther he says, " That he took  
 " to the sea at 14 years of age, and ever  
 " after follow'd it." And in the book of  
 " the second voyage, he says, " I had got  
 " two ships, and left one of them at *Porto*  
 " *Santo*, for a certain reason that occur'd  
 " to me, where she continued one day,  
 " and the next day after I join'd it at  
 " *Lisbon*, because I light of a storm and  
 " contrary winds at south-west, and she had  
 " but little wind at north-east, which was  
 " contrary." So that from these instances  
 " we may gather, how much experience he  
 " had in sea affairs, and how many countries  
 " and places he travell'd before he undertook  
 " his discovery.

## CHAP. V.

*The admiral's coming into Spain, and how he made himself known in Portugal, which was the cause of his discovering the West-Indies.*

*Another  
Columbus.*

AS concerning the cause of the admiral's coming into Spain, and his being addicted to sea-affairs, the occasion of it was a famous man, of his name and family, call'd *Columbus*, renown'd upon the sea, on account of the fleet he commanded against infidels, and even in his own country, inasmuch that they made use of his name to frighten the children in the cradle; whose person and fleet, it is likely were very considerable, because he at once took four *Venetian* galleys, whose bigness and strength I should not have believ'd, had I not seen them fitted out. This man was call'd *Columbus the Younger*, to distinguish him from another, who was a great seaman before him. Of which *Columbus the Younger*, *Marc Antony Sabellicus*, the *Livy* of our age, says in the eighth book of his tenth decade, That he lived near the time when *Maximilian*, son to the emperor *Frederick* the 3d, was chosen king of the *Romans*: *Jerome Donato* was sent ambassador from *Venice* into *Portugal*, to return thanks in the name of the republic to king *John* the 2d, because he had clothed and relieved all the crew belonging to the aforesaid great galleys, which were coming from *Flanders*, relieving them in such a manner, as they were enabled to return to *Venice*, they having been overcome by the famous Corsair *Columbus the Younger*, near *Lisbon*, who had strip'd and turn'd them ashore. Which authority of so grave an author as *Sabellicus*, may make us sensible of the afore-mention'd *Justiniani's* malice, since in his history he made no mention of this particular, to the end it might not appear, that the family of *Columbus* was less obscure than he would make it. And if he did it thro' ignorance, he is nevertheless to blame; for undertaking to write the history of his country, and omitting so remarkable a victory, of which its enemies themselves make mention. For the historian, our adversary, makes so great account of his victory, that he says, ambassadors were sent on that account to the king of *Portugal*. Which same author in the afore-mentioned eighth book, somewhat further, as one less obliged to inquire into the admiral's discovery, makes mention of it, without adding those twelve lies which *Justiniani* inserted. But to return to the matter in hand, I say, That whilst the admiral sail'd with the aforesaid *Columbus*

*the Younger*, which was a long time; it fell out that understanding the before-mentioned four great *Venetian* galleys were coming from *Flanders*, they went out to seek, and found them beyond *Lisbon*, about Cape. *St. Vincent*, which is in *Portugal*, where falling to blows, they fought furiously, and grappled, beating one another from vessel to vessel with the utmost rage, making use, not only of their weapons, but artificial fire-works; so that after they had fought from morning till evening, and abundance were kill'd on both sides; the admiral's ship took fire, as did a great *Venetian* galley, which being fast grappled together with iron hooks and chains, used to this purpose by sea-faring men, could neither of them be relieved, because of the confusion there was among them, and the fright of the fire, which in a short time was so increased, that there was no other remedy, but for all that could, to leap into the water, so to die sooner, rather than bear the torture of the fire. But the admiral being an excellent swimmer, and seeing himself two leagues or a little further from land, laying hold of an oar, which good fortune offered him, and sometimes resting upon it, sometimes swimming, it pleased God, who had preserved him for greater ends, to give him strength to get to shore; but so tired and spent with the water, that he had much ado to recover himself. And because it was not far from *Lisbon*, where he knew there were many *Genoeses* his countrymen, he went away thither as fast as he could, where being known by them he was so courteously received and entertain'd, that he set up house and marry'd a wife in that city. And so far as he behav'd himself honourably, and was a man of a comely presence, and did nothing but what was just; it happened that a lady whose name was *Donna Felipa Moniz*, of a good family and pensioner in the monastery of all saints, whither the admiral used to go to mass, was so taken with him, that she became his wife. His father-in-law *Peter Moniz Pereirello*, being dead, they went to live with the mother-in-law, where being together, and the seeing him so much addicted to cosmography, told him that her husband *Pereirello* had been a great sea-faring man, and that he with two other captains having obtained the king of *Portugal's* leave, went to make discoveries

*The admiral

*Argument  
for  
the  
fact*

coveries, upon condition, that dividing what they found into three parts they were to call lots who should chuse first. Being thus agreed, they sail'd away to the south-west, and arriv'd at the island of *Madera* and *Porto Santo*, places never before discovered. And because the island of *Madera* was biggest; they divid'd it into two parts; the island of *Porto Santo*, being the 3d which fell to the lot of the said *Peregrino*, *Columbus's* father-in-law, who had the government of it till he died.

The admiral being much delighted to hear such voyages and relations, his mother-in-law gave him the journals and sea charts left her by her husband, which still more inflam'd the admiral; and he enquired into the other voyages the *Portugueses* then made to *St. George de la Mira*, and along the coast of *Guinea*, being much pleas'd to discourse with those that had sail'd thither. To say the truth, I can not certainly tell whether whilst this wife lived, the admiral went to *Mira* or *Guinea*, as I said above, the reason seems to require it. However it was, as one thing leads to another; and one consideration to another, so whilst he was in *Portugal*, he

began to reflect, that as the *Portugueses* travel so far southward, it were no less proper to sail away westward, and land might in reason be found that way. That he might be the more certain and confident in this particular, he began to look over all the cosmographers again, whom he had read before, and to observe what astrological reasons would corroborate this project; and therefore he took notice of what any persons whatsoever spoke to that purpose, and of sailors particularly, which might any way be a help to him. Of all which things he made such good use, that he concluded for certain, that there were many lands west of the *Canary* islands, and *Cabo Verde*; and that it was possible to sail to, and discover them. But that it may appear from what mean arguments he came to deduce, or make out so vast an undertaking, and to satisfy many who are desirous to know particularly, what motives induced him to discover these countries, and expose himself in so dangerous an undertaking, I will here set down what I have found in his papers relating to this affair.

CHAP. VI.

*The principal motives that inclin'd the admiral to believe he might discover the West-Indies.*

BEING about to deliver the motives that inclin'd the admiral to undertake the discovery of the *West-Indies*, I say they were three, viz. natural reasons, authority of writers, and the testimony of sailors. As to the first, which is natural reason, I say, he concluded that all the sea and land compos'd a sphere or globe; which might be gone about from east to west, travelling round it, till men came to stand feet to feet one against another in any opposite parts whatsoever. Secondly, he gave it for granted, and was satisfied by the authority of approved authors, that a great part of this globe had been already travelled over, and that there then only remained to discover the whole, and make it known, that space which lay between the eastern bounds of *India*, known to *Ptolemy* and *Marinus*, round about eastward, till they came thro' our western parts to the islands *Azores*, and of *Cabo Verde* the most western parts yet discovered. Thirdly, He considered, that this space lying between the eastern

limits known to *Marinus*, and the afore-said island of *Cabo Verde*, could not be above a third part of the great circumference of the globe, since the said *Marinus* was already gone 15 hours, or 24 parts into which the world is divided towards the east; and therefore to return to the said isles of *Cabo Verde*, there wanted about eight parts; for the said *Marinus* is said to have begun his discovery towards the west. Fourthly he reckoned, that since *Marinus* had in his said cosmography, given an account of 15 hours, or parts of the globe towards the east, and yet was not come to the end of the eastern land, it followed of course, that the said end must be much beyond that; and consequently, the farther it extended eastward, the nearer it came to the islands *Cabo Verde*, towards our western parts; and that if such space were sea, it might easily be sail'd in a few days, and if land, it would be sooner discovered by the west, because it would be nearer to the said islands. To which reason

6 O son

son may be added, that given by *Strabo* in the 15th book of his cosmography, that no man with an army ever went so far as the eastern bounds of *India*, which *Ctesias* writes is as big as all the rest of *Asia*; *Oenopides* affirms, it is the third part of the globe; and *Nearchus*, that it is four months journey in a strait line; besides *Pliny* in the 17th chapter of his 6th book, says, That *India* is the third part of the earth: Whence he argu'd, that being so large, it must be nearer *Spain* by way of west. The 5th argument that induced him to believe, that the distance that way was small, he took from the opinion of *Alfraganus* and his followers, who make the circumference of the globe, much less than all other writers and cosmographers, allowing but 56 miles and two thirds to a degree. Whence he would infer, that the whole globe being small, that extent of the third part must of necessity be small, which *Marinus* left as unknown; therefore that part might be sail'd in less time than he assign'd; for since the eastern bounds of *India* were not yet discover'd, those bounds must lie near to us westward, and therefore the lands he should

Why call'd  
Indies.

discover, might properly be call'd *Indies*. By this it plainly appears, how much one Mr. *Roderick*, arch-deacon of *Seville*, was in the wrong as well as his followers, who blame the admiral; saying, He ought not to have call'd those parts *Indies*, because they are not so, whereas the admiral did not call them *Indies*, because they had been seen or discover'd by any other person, but as being the eastern part of *India* beyond *Ganges*, to which no cosmographer ever assign'd bounds, or made it border on any other country eastward, but only upon the ocean; and because these were the eastern unknown lands of *India*, and have no particular name of their own; therefore he gave them the name of the nearest country, calling them *West-Indies*, and the more because he knew all men were sensible of the riches and wealth of *India*; and therefore by that name he thought to tempt their catholic majesties, who were doubtful of his undertaking, telling them he went to discover the *Indies* by way of the west. And this mov'd him rather to desire to be employed by the king of *Castile*, than by any other prince.

## CHAP. VII

### The second motive inducing the admiral to discover the West-Indies.

A second  
motive  
from au-  
thors.

THE second motive that encouraged the admiral to undertake the afore-said enterprise, and which might reasonably give occasion to call the countries he should discover *Indies*, was the great authority of learned men, who said that it was possible to sail from the western coast of *Africa* and *Spain*, westward to the eastern bounds of *India*, and that it was no great sea that lay between them, as *Aristotle* affirms, at the end of his 2d book of heaven and the world; where he says, That they may sail from *India* to *Cadiz* in a few days. Which some think *Averroes* proves, writing upon that place. And *Seneca* in his first book of nature, looking upon the knowledge of this world, as nothing in respect of what is attain'd in the next life; says, a ship may sail in a few days with a fair wind from the coast of *Spain*, to that of *India*. And if as some would have it, this same *Seneca* writ the tragedies; we may conclude it was to the same purpose, that in the chorus of his *Medea*, he speaks thus;

Venient annis  
Sæcula feris, quibus Oceanus  
Vincta rerum laxet, & ingens  
Pateat tellus, Typhysque novos  
Delegat orbis, nec sit terris  
Ultima Thule.

That is, There will come an age in later years, when the ocean will loose the bonds of things, and a great country be discovered, and another like *Typhys* shall discover a new world, and *Thule* shall no longer be the last part of the earth. Which now most certainly has been fulfill'd in the person of the admiral. And *Strabo* in the first book of his cosmography, says, the ocean encompasses all the earth; that in the east, it washes the coast of *India*, and in the west, those of *Mauritania* and *Spain*, and that if the vastness of the atlantick did not hinder, but they might soon sail from the one to the other upon the same parallel. The same he repeats in the second book. *Pliny* in the second book of his natural history, Chap. III. adds, That the ocean furrounds

A letter  
concerning  
the dis-  
covery  
westward.

surrounds all the earth, and that the extent of it from east to west, is from *India* to *Cadiz*. The same author, book the 6th. chap. 31, and *Solinus*, chap. 68, of the remarkable things in the world, say, that from the islands *Gorgones*, supposed to be those of *Cabo Verde*, was forty days sail on the *Atlantick* ocean, to the islands *Hesperides*, which the admiral concluded were those of the *West-Indies*. *Marcus Paulus Venetus*, and *John Mandville* in their travels say, they went much farther eastward than *Ptolemy* and *Marinus* mention, who perhaps do not speak of the eastern sea; yet by the account they give of the east, it may be argued, that the said *India* is not far distant from *Africk* and *Spain*. *Peter Aliacus* in his Treatise, *De imagine mundi*, chap. 8. *De quantitate terræ habitabilis*, & *Julius Capitolinus*, *de locis habitabilibus*; and in several other treatises, say, that *Spain* and *India* are neighbours westward. And in the 19th chapter of his cosmography, he has these words; according to the philosophers and *Pliny*, the ocean that stretches between the western borders of *Spain* and *Africk*, and from the

beginning of *India* eastward, is of no great extent, and there is no doubt but it may be sail'd over in a few days, with a fair wind, and therefore the beginning of *India* eastward, can not be far distant from the end of *Africk* westward. These and the like authorities of such writers, inclined the admiral to believe that the opinion he had conceived was right, and one Mr. *Paul* physician to Mr. *Dominick* of *Florence*, contemporary with the admiral, much encouraged him to undertake the said voyage. For this Mr. *Paul* being a friend to one *Ferdinand Martinez*, a canon of *Lisbon*, and they writing to one another concerning the voyages made in the time of king *Alphonso* of *Portugal* to *Guinea*, and concerning what might be made westward; the admiral who was most curious in these affairs, got knowledge of it, and soon by the means of *Laurence Girardi*, a *Florentine* residing at *Lisbon*, writ upon this subject to the said Mr. *Paul*, sending him a small sphere, and acquainting him with his design. Mr. *Paul* sent his answer in *Latin*, which in *English* is thus.

CHAP. VIII.

A Letter from Paul, a physician of Florence, to the admiral, concerning the discovery of the Indies.

To Christopher Columbus, Paul the physician wishes health.

I Perceive your noble and earnest desire to sail to those parts where the spice is produced, and therefore in answer to a letter of yours, I send you another letter, which some days since I writ to a friend of mine, and servant to the king of *Portugal*, before the wars of *Castile*, in answer to another he writ to me by his highnesses order, upon this same account, and I send you another sea chart like that I sent him, which will satisfy your demands. The copy of that letter is this.

To Ferdinand Martinez canon of Lisbon, Paul the physician wishes health.

A letter concerning the discovery westward.

I Am very glad to hear of the familiarity you have with your most serene and magnificent king, and though I have very often discoursed concerning the short way there is from hence to the Indies, where the spice is produced, by sea, which I look upon to be shorter than that you take by the coast of *Guinea*; yet you now tell me, that his highness would have me make out and demonstrate

it, so as it may be understood and put in practice. Therefore, tho' I could better show it him with a globe in my hand, and make him sensible of the figure of the world; yet I have resolved to render it more easy and intelligible, to show this way upon a chart, such as are used in navigation; and therefore I send one to his majesty, made and drawn with my own hand, wherein is set down the utmost bounds of the west from *Ireland*, in the north, to the farthest part of *Guinea*, with all the islands that lie in the way: opposite to which western coast is described the beginning of the Indies, with the islands and places whither you may go, and how far you may bend from the north pole towards the equinoctial, and for how long a time; that is, how many leagues you may sail before you come to those places most fruitful in all sorts of spice, jewels, and precious stones. Do not wonder if I term that country where the spice grows west, that product being generally ascribed to the east, because those who shall sail westward, will always find those places in the west; and they that travel by land eastward, will ever find those places in the east. The strait lines that lie lengthways in the chart, show the distance there

there is from east to east, the other cross them, show the distance from north to south. I have also mark'd down in the said chart, several places in India, where ships might put in upon any storm or contrary winds, or any other accident unforeseen. And moreover, to give you full information of all those places, which you are very desirous to know, you must understand, that none but traders live or reside in all those islands, and that there is there as great a number of ships and seafaring people with merchandize, as in any other part of the world, particularly in a most noble part call'd Zacton, where there are every year an hundred large ships of pepper loaded and unloaded, besides many other ships that take in other spice. This country is mighty populous, and there are many provinces and kingdoms, and innumerable cities under the dominion of a prince call'd the great cham, which name signifies king of kings, who for the most part resides in the province of cathay. His predecessors were very desirous to have commerce, and be in amity with christians, and 200 years since, sent ambassadors to the pope, desiring him to send them many learned men and doctors to teach them our faith, but by reason of some obstacles the ambassadors met with, they returned back without coming to Rome. Besides there came an ambassador to pope Eugenius IV. who told him the great friendship there was between those princes, their people and christians. I discours'd with him a long while upon the several matters of the grandeur of their royal structures, and of the greatness, length and breadth of their rivers, and he told me many wonderful things of the multitude of towns and cities founded along the banks of the rivers, and that there were 200 cities upon one only river, with marble bridges over it of a great length and breadth, and adorn'd with abundance of pillars. This country deserves as well as any other, to be discover'd, and there may not only be great profit made there, and many things of value found, but also gold, silver, all sorts of precious stones, and spices in abundance, which are not brought into our parts. And it is certain that many wise men, philosophers, astrologers, and other persons skill'd in all arts, and very ingenious, govern that mighty province, and command their armies. From Lisbon directly westward, there are in the chart 26 spaces, each of which contains 250 miles, to the most noble and vast city of Quilay, which is 100 miles in compass, that is 35 leagues; in it there are 10 marble bridges: the name signifies a heavenly city, of which wonderful things are reported, as to the ingenuity of the people, the buildings and revenues. This space above mentioned, is almost the third part of the globe. This city is

in the province of Mango, bordering on that of Cathay, where the king for the most part resides. From the island Antilia, which you call the seven cities, and where, if you have some knowledge, to the most noble island of Cipango, are ten spaces, which make 2500 miles, or 225 leagues, which island abounds in gold, pearls, and precious stones: and you must understand, they cover their temples and palaces with plates of pure gold. So that for want of knowing the way, all those things are hidden and conceal'd, and yet may be gone to with safety. Much more might be said, but having told you what is most material, and you being wise and judicious, I am satisfied there is nothing of it, but what you understand, and therefore I will not be more prolix. Thus much may serve to satisfy your curiosity, it being as much as the shortness of time and my business would permit me to say. So I remain most ready to satisfy and serve his highness to the utmost, in all the commands he shall lay upon me.

Florence, June 25.

1474.

After this letter, he again writ to the admiral as follows.

To Christopher Columbus, *Pat!* the physician wishes health.

I Received your letters with the things you sent me, which I take as a great favour, and commend your noble and ardent desire of sailing from east to west, as it is markt out in the chart I sent you, which would demonstrate it self better in the form of a globe. I am glad it is well understood, and that the voyage laid down is not only possible, but true, certain, honourable, very advantageous, and most glorious among all christians. You cannot be perfect in the knowledge of it, but by experience and practice, as I have had in great measure, and by the solid and true information of worthy and wise men, who are come from those parts to this court of Rome, and from merchants who have traded long in those parts, and are persons of good reputation. So that when the said voyage is perform'd, it will be to powerful kingdoms, and to most noble cities and provinces, rich, and abounding in all things we stand in need of, particularly in all sorts of spice in great quantities, and store of jewels. This will moreover be grateful to those kings and princes, who are very desirous to converse and trade with christians of these our countries, whether it be for some of them to become christians, or else to have communication with the wise and ingenious men of these parts, as well in point of religion, as

in all sciences, because of the extraordinary account they have of the kingdoms and government of those parts. For which reasons and many more that might be alledged, I do not at all admire, that you who have a great heart, and all the Portuguese nation, which has ever had notable men in all undertakings, be eagerly bent upon performing this voyage.

This letter, as was said before, encour-

aged the admiral much to go upon his discovery, tho' what the doctor there wrote was false, as believing that the first land they should meet with, would be Catbay, and the empire of the Great Cham, with the rest he there relates; since as experience has made appear, the distance from our Indies to that, is greater than from hence to our Indies.

CHAP. IX.

*The third motive and inducement, which in some measure excited the admiral to discover the West-Indies.*

As the  
admiral  
was  
the  
first  
to  
discover  
the  
West-Indies.

THE third and last motive the admiral had to undertake the discovery of the *West-Indies*, was the hopes of finding, before he came to *India*, some very beneficial island or continent, from whence he might the better pursue his main design. This his hope was grounded upon the authority of many wise men and philosophers, who look'd upon it as most certain, that the greatest part of this terraqueous globe was land, or that there was more earth than sea; which if so, he argued, that between the coast of *Spain* and the bounds of *India* then known, there must be many islands, and much continent, as experience has since demonstrated, which he the more readily believed, being imposed upon by many fables and stories which he heard told by several persons and sailors, who traded to the islands and western sea, and to *Madera*; which testimonies making somewhat to his purpose, they were sure to gain a place in his memory. Therefore I will not forbear relating them, to satisfy those that take delight in such curiosities. It is therefore requisite to be understood, that a pilot of the king of *Portugal*, whose name was *Martin Vicente*, told him, that he being once 450 leagues westward of cape *St. Vincent*, found and took up in the sea, a piece of wood ingeniously wrought, but not with iron; by which, and the winds having been west for many days, he guessed that piece of wood came from some island that way. Next one *Peter Correa*, who had married the admiral's wife's sister, told him, that in the island of *Porto Santo* he had seen another piece of wood brought by the same winds, well wrought, as that above mentioned; and that there had been canes found so thick, that every joint would hold above four quarts of wine; which he said he affirmed to the king of *Portugal* himself dis-

couraging with him about these affairs, and that they were shown him; and there being no place in our parts, where such canes grow, he look'd upon it as certain, that the wind had brought them from some neighbouring islands, or else from *India*. For *Ptolemy* in the first book of his cosmography, chap. 17, says, there are such canes in the eastern parts of *India*: And some of the islanders, particularly the *Azores* told him, that when the west wind blew long together, the sea drove some pines upon those islands, particularly upon *Gratijsa* and *Fayal*, there being no such in all those parts. And that the sea cast upon this island of *Flores*, another of the *Azores*, two dead bodies of men, very broad faced, and differing in aspect from the christians. At cape *Verga* and thereabouts, they say, they once saw some cover'd *Almadies* or boats, which it is believed were drove that way by stress of weather, as they were going over from one island to another. Nor were these only the motives he then had, which yet seem'd reasonable; but there were those that told him they had seen some islands, among whom was *Anthony Leme*, married in the island of *Madera*, who told him, that having made a considerable run in a caraval of his own westward, he had seen three islands. These he did not give credit to, because he found by their own words and discourse, that they had not fail'd 100 leagues to the westward, and that they had been deceived by some rocks, taking them for islands; or else perhaps they were some of those floating islands that are carried about by the water, call'd by the sailors *Aguadas*, whereof *Pliny* makes mention the first book, chap. 97, of his natural history; where he says, that in the northern parts the sea discover'd some spots of land, on which there are trees of deep roots, which parcels of land are carried

Floating-  
islands.

about like floats or islands upon the water. *Seneca* undertaking to give a natural reason why there are such sorts of islands, says in his third book, that it is the nature of certain spongy and light rocks, so that the islands made of them in *India*, swim upon the water. So that were it never so true, that the said *Anthony Leme* had seen some island, the admiral was of opinion, it could be no other than one of them, such as those called *St. Brandam* are supposed to be, where many wonders are reported to have been seen. There is also an account of others that lie much northward, and always burn. *Jucentius Fortunatus* relates, that there is an account of two islands towards the west, and more southward than those of *Cabo Verde*, which swim along upon the water. These and the like grounds might move several people of the islands of *Ferro* and *la Gomera*, as also of the *Azores*, to affirm that they saw islands towards the west every year, which they look'd upon as most certain, and many persons of reputation swore it was true. He says moreover, that in the year 1484, there came into *Portugal*, one from the island of *Madera* to beg a caraval of the king, to go to discover a countrey, which he swore he saw every year, and always after the self-same manner, agreeing with others, who said they had seen it from the islands *Azores*. On which grounds in the charts and maps formerly made, they placed some islands thereabouts; and particularly because *Aristotle* in his book of wonderful natural things, affirms, it was reported that some *Carthaginian* merchants had sail'd through the *Atlantick* sea, to a most fruitful island, as we shall declare more at large hereafter, which island some *Portuguese* inserted in their maps, calling it *Anvilla*; tho' they did not agree in the situation with *Aristotle*, yet none placed it above 200 leagues due west from the *Canaries* and *Azores*, which they conclude to be certainly the island of the seven cities, peopled by the *Portuguese* at the time that *Spain* was conquered by the *Moors* in the year 714. At which time they say, seven bishops with their people embark'd and sail'd to this island, where each of them built a city; and to the end none of their people might think of returning to *Spain*, they burnt the ships, tackle and all things necessary for sailing. Some *Portuguese* discouraging about this island, there were those that affirmed several *Portuguese* had gone to it, who could not find the way to it again. Particularly they say, that in the time of *Henry* infant of *Portugal*, a *Portuguese* ship was drove by stress of weather to this island *Anvilla*, where the

men went ashore, and were led by the islanders to their church, to see whether they were christians, and observed the *Roman* ceremonies, and perceiving they did, they desired them not to depart till their lord came, who was then absent, and would make very much of them, and give them many presents, and to whom they would presently send advice; but the master and seamen were afraid of being detained, suspecting those people had not a mind to be discovered, and might therefore buy their ship, and for that reason they sail'd back to *Portugal*, hoping to be rewarded for what they had done by the *Infante*. He reproved them severely, and bid them return quickly; but the master for fear run away from *Portugal* with the ship and men; and it is reported, that whilst the seamen were at church in the said island, the boys of the ship gathered sand for the cook-room, the third part whereof they found to be pure gold. Among others that set out to discover this island, was one *James de Fieue*, whose pilot *Peter Velasquez*, of the town of *Palos de Moguer*, told the admiral in the monastery of *St. Mary de la Rabida*, that they set out from *Feyal*, and sail'd above 150 leagues south-west, and in their return discovered the island *Flores*, being led to it by abundance of birds—they saw fly that way, because those being land and not sea-fowls, they judged they could not rest but upon land: After which they sail'd so far north-east, till they came to cape *Clare*, in the west of *Ireland*, where they met with stiff westerly winds, and yet a smooth sea, which they imagined was caused by some land that shelter'd it towards the west. But it being then the month of *August*, they would not turn towards the island for fear of winter. This was above forty years before our *Indies* were discovered. This account was confirm'd by the relation a mariner at port *St. Mary* made, telling him that once making a voyage into *Ireland*, he saw the said land, which he then thought to be part of *Tartary*, falling off towards the west, which it is like was the land we now call *Bacallaos*, and that they could not make up to it by reason of the bad weather. This he said agreed with what one *Peter de Valasco* of *Galicia* affirm'd to him, in the city of *Murcia* in *Spain*, which was, that sailing for *Ireland*, they went away so far to north-west, that they discovered land west of *Ireland*, which land he believes to be the same, that one *Fennaldolmos* attempted to discover after the manner as I shall here faithfully set down, as I found it in my father's writings; that it may appear how some men lay the foundation of great mat-

ters upon slight grounds. *Gonzalo de Oviedo*, in his history of the *Indies*, writes, That the admiral had a letter, wherein he found the *Indies* describ'd, by one that had before discovered them, which was not so, but thus: *Vincent Dear*, a *Portuguese* of *Tavira*, returning from *Guinea* to the *Tercera* islands, and having pass'd the island of *Madera*, which he left east of him, saw, or imagin'd he saw, an island which he certainly concluded to be land. Being come to the *Tercera* island, he told it to one *Luke de Cazzana*, a *Genoese* merchant, who was very rich, and his friend, persuading him to fit out some vessel to conquer that place; which he was very willing to do, and obtain'd licence for it of the king of *Portugal*. He writ therefore to his brother *Francis de Cazzana*, who resided at *Sevil*, to fit out a ship with all

speed for the said pilot. But the said *Francis* making a jest of such an undertaking, *Luke de Cazzana* set out a vessel in the *Tercera* island, and the pilot went out three or four times to seek the said island, sailing from 120 to 130 leagues, but all in vain, for he found no land. Yet for all this, neither he nor his partner gave over the enterprize till death, always hoping to find it. And the brother aforesaid, told me and affirm'd it, that he knew two sons of the captain that discovered the *Tercera* island, their names *Michael* and *Jasper Coterel*, who went several times to discover that land, and at last in the year 1502, perish'd in the attempt, one after another, without ever being heard of; and that this was well known to many.

# CHAP. X.

*Proving it to be false, that the Spaniards had formerly the dominion of the Indies, as Gonzalo de Oviedo endeavours to make out in his history.*

*Aristotle  
account of  
a Spanish  
author dis-  
puted.*

IF all we have said above, concerning so many imaginary islands and countries, appears to be a mere fable and folly, how much more reason have we to look upon that as a falshood, which *Gonzalo Fernandez de Oviedo* conceits in his natural history of the *Indies*, looking upon his own imagination as a certain truth, and saying he has fully made out, that there was another discoverer of this navigation of the ocean, and that the *Spaniards* had the dominion of those lands; alledging to make out his assertion, what *Aristotle* writes of the island *Atlantis*, and *Sebosus* of the *Hesperides*. This he affirms upon the judgment of some persons, whose writings we have duly weigh'd and examin'd, and I would have omitted to talk on this subject, to avoid condemning some, and tiring the reader, had I not consider'd, that some persons, to lessen the admiral's honour and reputation, make great account of such notions. Besides I thought I did not perform my duty fully, by setting down with all sincerity the motives and inducements that inclin'd the admiral to undertake his unparalleled enterprize, if I should suffer such a falshood, which I know to be so, to pass unobserv'd. Therefore, the better to discover his mistake, I will in the first place, set down what *Aristotle*, as related by one *F. Theophilus de Ferra-*

*riis*, says as to this point; which *F. Theophilus* among *Aristotle's* problems collected by him, brings in a book call'd, *De admirandis in natura auditis*, a chapter with these following words: Beyond *Hercules's* pillars, it is reported there was formerly found an island in the atlantic sea, by certain *Carthaginian* merchants, which had never before been inhabited by any but brute beasts. It was all wooded and covered with trees, had a great many navigable rivers, and abounded in all things nature usually produces, though removed not many days sail from the continent. It happened that some *Carthaginian* merchants coming to it, and finding it a good country, as well for the richness of the soil, as temperature of the air, they began to people it. But the senate of *Carthage* being offended at it, soon made a publick decree, That for the future, no person upon pain of death, should go to that island, and they that went first were put to death; to the end that other nations should not hear of it, and some more powerful people take possession of it; by which means it might become an enemy to their liberty. Now I have faithfully quoted this authority, I will give the reasons that induce me to say, That *Oviedo* has no just cause to affirm that this island was *Hispaniola* or *Cuba*, as he asserts. In the first place, because *Gonzalo de Oviedo* not understanding

Atlantis  
neither Hi-  
spaniola  
nor Cuba.

understanding *Latin*, he of necessity took such interpretation of this place, as some body made him; who, by what we see did not well know how to translate out of one language into another, since he alter'd and chang'd the *Latin* text in several particulars, which perhaps deceiv'd *Oviedo*, and inclin'd him to believe that this quotation spoke of some island in the *Indies*; because we do not read in the *Latin* text, that these people went out of the straits of *Gibraltar*, as *Oviedo* writes; nor much less, that the island was large, nor its trees great, but that it was an island much wooded. Nor is it found there, that the rivers were wonderful; nor does it speak of its fatness, or say it was more remote from *Africa* than *Europe*, but in plain terms, says, it was remote from the continent: Nor does it say any towns were built there, for traders who happened upon it could build but little: Nor is it said to be famous, but that they were afraid its fame would spread abroad into other nations. So that the expostor who interpreted this place to him, being so ignorant, it caus'd *Oviedo* to imagine it to be another thing than really it was: and if he should say, that it is otherwise in *Aristotle's* text, and that what the friar writes, is as it were a compendium of what *Aristotle* writ; I must ask him who gave him authority to bestow so many kingdoms on whom he pleases, and to rob one of his honour, who has gain'd it so fairly; and tell him he ought not to have been satisfied with reading that authority as it lies in the friar's pamphlet, but should have seen it in the original, that is, in *Aristotle's* works. Besides that he was misinform'd in this case, for tho' *Theophilus* in all his other books following *Aristotle*, delivered the substance and sum of what he says; yet he did not so in his book *De admirandis*, he himself owning in the beginning, that he does not in that his book abridge *Aristotle*, as he has done in the others; but that he there inserts all the text word for word; and therefore it cannot be said there was either more or less in *Aristotle*, than what he set down. Add to this, That *Anthony Beccaria of Verona*, who translated this book out of *Greek* into *Latin*; of which translation *Theophilus* made use, did not render it so faithfully, but that he inserted several matters differing from the *Greek* original, as will appear to any man that shall observe it.

In the second place I say, that tho' *Aristotle* had writ so, as *Theophilus* delivers it, yet *Aristotle* himself quotes no author, but speaking as of a thing, for which there is no good authority, says, *Fertur*, which implies that what he delivers concerning this island, he

writes as doubtful and ill grounded. Besides, He writes of a thing not then new but which had happened long before; saying, It is reported, that formerly an island was found, and therefore it may well be said according to the proverb, *That in great travells there are great lyes*: Which proverb is now verifi'd; for in that narration there are circumstances no way agreeable to reason, for as much as it says, That this island abounded in all things, but had never been inhabited, which is not consonant, nor likely, for as much as fruitfulness in land proceeds from its being cultivated by the inhabitants; and where there are no inhabitants, the land is so far from producing any thing of it self, that even those things which art produces, grow wild and useless. Nor is it more likely, that the *Carthaginians* should be displeased, because their people had found such an island, and should put to death the discoverers; for if it was so remote from *Carthage* as the *Indies* are, it was a folly to fear that those who should come to inhabit there would conquer *Carthage*, unless, that as *Oviedo* affirms, the *Spaniards* possess'd those islands before. He would farther assert, That the *Carthaginians* were prophets, and that now their jealousy and prophesie were fulfill'd, the emperor taking *Tunis* or *Carthage*, with the money brought from the *Indies*, which I am satisfied he would have said, to gain more favour by telling such news, than he did, but that his book was publish'd before. So that any judicious person may conceive it is a folly to say, that island was never more heard of, because the *Carthaginians* quitted the dominion of it, for fear any other nation should take it from them, and come afterwards to destroy their liberty; for they ought to have fear'd this much more from *Sicily* or *Sardinia*, that lay but two days sail from their city, than from *Hispaniola*, between which and them, there lay one third of the world. And if it should be objected that they apprehended the wealth of that country, might empower their enemies to do them harm; I answer, they had more cause to hope, that being themselves masters of those riches, they might oppose and subdue whom they pleased, and that if they left that island unpeopled, they left it in the power of another to discover it; whence the same mischief might follow, which they feared. And therefore they ought rather to fortify it and secure their trade to it, as we know they did another time upon the like occasion; for having found the islands which they then call'd *Cassiterides*, and now we call the *Azores*, they kept that voyage very private, because of the tin they brought from thence; as *Strabo* tells us at the

grounded. Be-

ound the islands  
erides, and now  
pt that voyage  
the tin they  
*Crabo* tells us at  
the

the latter end of the third book of his *co-*  
*mography*. Wherefore, granting it were  
true, what *Aristotle* had writ in this fable,  
it might be said he meant it of the voyage  
to the islands *Azores*, which either for want  
of better understanding, and the great an-  
tiquity of the testimony, or through affec-  
tion, which blinds men, *Oviedo* argues,  
should be understood of the *Indies* we now  
possess, and not of the said islands *Azores*,  
or any of them. If it should be replied,  
that this cannot be, because *Strabo* does not  
say they were the *Cartaginians* who were  
possessed of the islands *Azores*, but the *Phe-*  
*nicians*: I answer, that the *Cartaginians*  
being come from *Poenicia* with their queen  
*Dido*, therefore she and they were called  
*Poenicians* at that time, as the christians  
born in the islands are now called *Spaniards*.  
And should it be again urged, that the  
place of *Aristotle* which speaks of this island,  
says, it had many navigable rivers, which  
are not to be found in the islands *Azores*,  
but in *Cuba* and *Hispaniola*. I answer, that  
if we will take notice of this particular,  
they add, that there were abundance of  
beats in them, which there are not in *Cuba*  
or *Hispaniola*; and it may well be, that in  
a thing of such antiquity, there might be  
some mistake in relating that particular,  
as often happens in many of these uncer-  
tain and so far distant antiquities. Observe  
that neither *Cuba* nor *Hispaniola* have any  
deep navigable rivers, as the place quoted  
intimates; and that any ships may enter the  
mouths of the biggest rivers of those islands,  
but not conveniently sail up them. Besides  
that, as has been said, how great soever  
*Aristotle's* authority may be, the word might  
possibly be corrupted, and it might be writ  
*navigandum*, instead of *potandum*, which  
better agreed with what he treated of, com-  
mending it for plenty of drinking water,  
as well as fruitfulness in producing things  
to eat. This might well be verify'd of any  
one of the *Azores*, and with more reason,  
because neither *Cuba* nor *Hispaniola* lie so,  
as that the *Cartaginians* could be carried  
to them either by reason of their nearness,  
or by any mischance; for if those who went  
purposely with the admiral to discover,  
thought the way so long, that they would  
have turned back, how much longer must  
it seem to them who designed no such te-  
dious voyage, and who, as soon as the time  
would permit, had turned back towards  
their country! Nor does any storm last so  
long, as to carry a ship from *Cadiz* to *His-*  
*paniola*; nor is it likely, that because they  
were merchants, they should have any mind  
to run farther from *Spain* or *Cartage*, than  
the wind obliged them, especially at a time  
when navigation was not come to that per-

Vol. II.

fection as now it is. For which reason ve-  
ry inconsiderable voyages were then look'd  
upon as great, as appears by what we read  
of *Jason's* voyage to *Colchus*, and that of  
*Ulysses*, thro' the *Mediterranean*, in which  
so many years were spent; and therefore  
they were so famous, that the most excel-  
lent poets have given an account of them,  
because of the little knowledge they had  
then of sea-affairs, whereas it has been so  
approved of late in our age, that there have  
been those who had the boldness to sail  
round the world, which has contradicted the  
proverb that said, *He that goes to cape Nam*,  
*will either return or not*, which cape is in  
*Africk*, not very much distant from the *Ca-*  
*naries*. Besides, it is a notorious mistake,  
to think the island, whither those mer-  
chants were carried, could be either *Cuba*  
or *Hispaniola*; for it is well known, that  
with all the knowledge we have at this  
present, 'tis almost impossible to come at  
them, without meeting with any other  
islands that encompass them all round. But  
if we would say that land or island was  
none of the *Azores*, as has been said above,  
one lye ought to be grafted upon another,  
by alledging that it was the same island of  
which *Seneca* in his fourth book, makes  
mention, where he tells us, that *Thucydides*  
speaks of an island called *Atlantica*, which  
in the time of the *Peloponnesian* war was all,  
or mostly drowned. Whereof *Plato* also  
makes mention in his *Timæus*. But because  
we have discoursed too long concerning  
these fables, I will proceed to the next point,  
where it is said, that the *Spaniards* had en-  
tirely the dominion of the said islands;  
which opinion is grounded on what *Statius*  
and *Sebosus* say, that certain islands called  
*Hesperides*, lay forty days sail west of the  
islands *Gorgones*. And hence it is argued,  
that since those must of necessity be *Indies*,  
and are called *Hesperides*; that name came  
from *Hesperus*, who was king of *Spain*, who of  
consequence, and the *Spaniards* were lords  
of that country. So that rightly consider-  
ing his words, he endeavours from uncer-  
tain premises to deduce three infallible con-  
sequences, contrary to *Seneca's* rule, who  
in his sixth book of *Nature*, speaking of  
of such like things, says it is hard to affirm  
any thing as sure and certain upon grounds  
that are no other than conjectures, as here  
*Oviedo* does; forasmuch as only *Sebosus* is  
said to have made mention of those islands  
*Hesperides*, declaring towards what part they  
lie, but not mentioning that they were the  
*Indies*, or of whom they took the name,  
or by whom conquered. And if *Oviedo*  
out of *Berosus*, affirms that *Hesperus* was  
King of *Spain*; I grant it to be true, but  
not that he gave the name to *Spain*, or

*Hespe-*  
*rides* none  
of the  
*Indies*.

6 Q

*Italy*.

*Italy*. But he, like a true historian, owning that *Berosus* fails him in this particular, took up with *Hyginus*, yet cautiously without mentioning in what book or chapter; and thus he conceals his authority; for in short, no place is to be found where *Hyginus* speaks of any such matter; but on the contrary, in one only book of his that is extant, entitul'd, *De poetica astronomia*, he has not only no such words; but in three several places where he speaks of these *Hesperides*, he says thus; *Hercules* is painted as killing the dragon that guarded the *Hesperides*. And somewhat farther he says, that *Hercules* being sent by *Eurytheneus* for the golden apples to the *Hesperides*, and not knowing the way thither, he went to *Prometheus* on mount *Caucasus*, and entreated him to shew him the way, whence follow'd the death of the dragon. Now according to this we shall have other *Hesperides* in the east, to whom also *Oviedo* may say, *Hesperus* king of *Spain* gave his name. *Hyginus* says farther, in the chapter of planets, that it appears by several histories, that the planet *Venus* is called *Hesperus*, because it sets soon after the sun. From all which we may infer, that if we ought to make use of any testimonies or quotations from persons used to relate poetical fables, as *Hyginus* does, that very same which *Hyginus* says, rather makes against *Oviedo* than for him; and we may suppose and affirm, they were

called *Hesperides* from a certain star. And as the *Greeks* for the same reason call'd *Italy* *Hesperia*, as many write; so we may say, *Sebosus* called these islands *Hesperides*, and made use of the same conjectures, and some reasons to shew whereabouts they lay, which we said above, moved the admiral to believe for certain, that there were such islands westward.

Thus we may conclude, that *Oviedo* did not only presume to counterfeit authorities for what he said, but that either through inadvertency, or to please him who told him these things (for it is certain he did not understand them himself) he maintain'd two contradictions, the disagreement between which were sufficient to discover his error. For if the *Cartaginians*, who, as he says, arrived at *Cuba* or *Hispaniola*, found that country inhabited by none but brute beasts, how could it be true, that the *Spaniards* had been possessed of it long before, and that their king *Hesperus* gave it his name? Unless perhaps he will say, that some deluge unpeopled it; and that afterwards some other *Noah* restored it to that condition it was discovered in by the admiral. But because I am quite tired with this dispute, and methinks the reader is cloy'd with it, I will not dilate any more upon this point, but follow on our history.

## CHAP. XI.

*How the admiral was disgusted by the king of Portugal on account of the discovery he propos'd to him.*

*Proposals made to the king of Portugal.*

THE admiral now concluding that his opinion was excellently well grounded, he resolv'd to put it in practice, and to sail the western ocean in quest of those countries. But being sensible that such an undertaking was only fit for a prince, who could go through with and maintain it; he resolv'd to propose it to the king of *Portugal*, because he liv'd under him. And though king *John* then reigning, gave ear to the admiral's proposals, yet he seem'd backward in embracing them, because the great trouble and expence he was at upon account of the discovery and conquest of the western coast of *Africa*, call'd *Guinea*, without any considerable success as yet, or being as yet able to weather the cape of *Good Hope*, which name some say was given it instead of *Agelingué*, its proper denomination, because that was the farthest they hoped to extend their discoveries and con-

quests, or as others will have it, because this cape gave them hopes of better countries and navigation. Be it as it will, the aforesaid king had but little inclination to lay out more money upon discoveries; and if he gave any ear to the admiral, it was because of the excellent reasons he gave to prove his opinion, which so far prevail'd upon him, that there remain'd only to grant the admiral those terms he demand'd. For the admiral being a man of a noble and generous spirit, would capitulate to his great benefit and honour, that he might leave behind him such a reputation, and so considerable a family, as became his great actions and merits. For this reason the king by the advice of one doctor *Calzadilla*, of whom he made great account, resolv'd to send a caraval privately, to attempt that which the admiral had propos'd to him; because in case those countries were so discovered,

*King Henry VII. of England.*

*The admiral sails for Spain.*

covered, he thought himself not oblig'd to bestow any great reward, which might be demanded on account of the discovery. Having thus speedily equip'd a caraval, and going out, it was to carry supplies to the islands of *Cabo Verde*, he sent it that way the admiral had propos'd to go. But those he sent wanted the knowledge, constancy, and spirit of the admiral. After wandering many days upon the sea, they turned back to the islands of *Cabo Verde*, laughing at the undertaking, and saying, it was impossible there should be any land in those seas. This being come to the admiral's ear, and his wife dead, he took such an aversion to that city and nation, that he resolved to go to *Castile*, with a little son he had left him by his wife, call'd *D. James Columbus*, who inherited his father's estate. But fearing lest if the king of *Castile* should not consent to his undertaking, he might be forced to propose it to some other prince, which would take up much time, he sent a brother he had with him, called *Bartholomew Columbus*, into *England*, who tho' he was no *Latin* scholar, was a skilful and judicious man in sea affairs, and could make sea charts, globes, and other instruments fit for that profession, having been taught by the admiral his brother. *Bartholomew Columbus* being on his way for *England*, it was his fortune to fall into the hands of pyrates, who stripp'd him and the rest of his company. For this reason, and being sick and poor in that country, it was a long time before he could deliver his message, till having got some supply by making sea-charts, he began to make some proposals to *King Henry the VIIth.* then reigning, to whom he presented a map of the world, on which were these verses, which I found among his papers, and shall be here insert'd, rather for their antiquity than elegance.

*Terrarum quicunque cupis feliciter oras  
Noscere, cuncta decens docte pictura docabit,  
Que Strabo, affirmat, Ptolemæus, Plinius,  
atque  
Isidorus; non una tamen sententia cniq.  
Pingitur hic etiam nuper sulcata carinis  
Hispanis Zona illa, prius incognita genti,  
Torrida, quæ tandem nunc est notissima multis.*

*Pro auctore, sive pictore.*

And a little lower.

*Genoa cui patria est, nomen cui Bartholomæus  
Columbus de terra rubra, opus edidit istud,  
Londiniis Ann. Dom. 1480. atque in super anno.  
Octava Decimaque die cum tertia mensis  
Febr. Laudes Christo cantentur abunde.*

The sense of the first lines is to this effect. Whosoever thou art that desirest to know the coasts of countries, must be taught by this draught, what *Strabo*, *Ptolemy*, *Pliny*, and *Isidorus* assert, tho' not agreeing in all points. Here is also set down, the formerly unknown torrid zone, now known to many. For the author or painter. The second verses implied, That his name was *Bartholomew Columbus* of the red earth, a *Genoese*, published this work at *London*, Anno 1480, the 21st of February. Praise to God.

And because it may be observed, that he says, *Columbus of the red earth*; I must acquaint the reader, that I have seen some subscriptions of the admiral's, before he had that title, where he writ *Columbus de terra rubra*. But to return to the king of *England*; I say, that he having seen the map, and what the admiral offer'd him, readily accepted of it, and ordered him to be sent for. But God having reserved it for *Castile*, the admiral had at that time gone his voyage, and was returned with success, as shall be shewn in its place.

## CHAP. XII.

*The admiral's departure from Portugal, and the conferences that he had with their catholic majesties, king Ferdinand, and queen Isabel or Elizabeth.*

The admi-  
ral goes  
into Spain.

I Will now forbear relating how *Bartholomew Columbus* proceeded in *England*, and will return to the admiral, who about the end of the year 1484, stole away privately out of *Portugal*, with his son *James*, for fear of being stopped by the king; for he being sensible how faulty they were, whom he had sent with the caraval, had a mind to

restore the admiral to his favour, and desired he should renew the discourse of his enterprize; but not being so diligent to put this in execution, as the admiral was in getting away; he lost that good opportunity, and the admiral got into *Castile* to try his fortune, which was there to favour him. Therefore leaving his son in a monastery at

*Palos,*

*Palos*, called *la Rabida*, he presently went away to the catholick king's court, which was then at *Cordova*; where being affable, and of pleasant conversation, he contracted friendship with such persons as he found most inclinable to his undertaking, and fittest to persuade the king to embrace it; among whom was *Lewis de Santangel* an *Arragonian* gentleman, clerk of the allowances in the king's household, a man of great prudence and reputation. But because the matter required to be handled with learning, rather than empty words and favour, their highnesses committed it to the prior of *Prado*, afterwards archbishop of *Granada*, ordering him together with some cosmographers to take full information in this affair, and report their opinions therein. But there being few cosmographers at that time, those that were called together were not so skilful as they ought to be; nor would the admiral so far explain himself as that he might be served as he had been in *Portugal*, and be deprived of his reward. For this reason, the answer they gave their highnesses was as various as were their judgments and opinions. For some said, that since in so many thousand years as had pass'd since the creation, so many skilful failers had got no knowledge of such countries; it was not likely that the admiral should know more than all that were then, or had been before. Others, who inclin'd more to cosmographical reason, said the world was so prodigious great, that it was incredible three years sail would bring him to the end of the east, whither he design'd his voyage; and to corroborate their opinion, they brought the authority of *Seneca*, who in one of his works, by way of argument, said, that many wise men among them disagreed about this question, whether the ocean were infinite, and doubted whether it could be sail'd, and tho' it were navigable, whether habitable lands would be found on the other side, and whether they could be gone to. They added, that of this lower globe of earth and water, only a small compass was inhabited, which had remained in our hemisphere above water, and that all the rest was sea, and not navigable, but only near

*Reason: a-  
gainst his  
undertak-  
ing.*

the coasts and rivers. And that wise men granted it was possible to sail from the coast of *Spain* to the farthest part of the west. Others of them argued almost after the same manner as the *Portuguese* had done about sailing to *Guinea*, saying, That if any man should sail streight away westward, as the admiral proposed, he would not be able to return into *Spain*, because of the roundness of the globe, looking upon it as most certain, that whosoever should go out of the hemisphere known to *Ptolemy*, would go down, and then it would be impossible to return, affirming it would be like climbing a hill, which ships could not do with the stiffest gale. Tho' the admiral sufficiently solv'd all these objections; yet the more powerful his reasons were, the less they understood him thro' their ignorance; for when a man grows old upon ill principles in mathematics, he cannot conceive the true, because of the false notions at first imprinted in his mind. In short, all of them holding to the *Spanish* Proverb, which, tho' it be contrary to reason, commonly says, *dubitat Augustinus, St. Augustin* questions it, because the said saint in his 21st book, and 9th chapter *Of the city of God*, denies and looks upon it as impossible that there should be *Antipodes*, or any going out of one hemisphere into the other; and further urging against the admiral those fables that are current about the five zones, and other untruths, which they looked upon as most certainly true, they resolved to give judgment against the enterprize, as vain and impracticable; and that it became not the state and dignity of such great princes, to be moved upon such weak information. Therefore after much time spent upon this subject, their highnesses answered the admiral, that they were then taken up with many other wars and conquests, and particularly the conquest of *Granada*, which they had then in hand, and therefore could not conveniently attend that new undertaking, but that in time there would be more conveniency to examine and execute that which he proposed. And to conclude, their majesties would not give ear to the great proposals the admiral made.

CHAP. XIII.

*How the admiral not agreeing with the king of Castile, resolved to go elsewhere to offer his service.*

the admiral not agreeing with more discontent.  
**W**Hilst this was in agitation, their catholic Majesties had not been always settled in one place, because of the war they made in *Granada*, for which reason it was a long time before they came to a resolution and gave their answer. The admiral therefore went to *Sevil*, and finding their highnesses no way resolved more than at first; he concluded to give the Duke of *Medina Sidonia* an account of his project. But after many conferences, seeing there was no likelihood of coming to such conclusion as he wish'd for in *Spain*, and that the execution of his design was too much delay'd; he resolved to apply himself to the King of *France*, to whom he had already writ concerning this affair, designing, if he were not admitted there, to go into *England*, next to seek out his brother, of whom he had as yet no manner of news. Being so resolved to set out for the Monastery of *Rabida*, to send his son *James*, whom he had left there, to *Cordova*, and then proceed on his journey. But to the end what God had decreed, should not be disappointed, he put it into the heart of *F. John Perez*, guardian of that house, to con-

tract such friendship with the admiral, and be so taken with his project, that he was concern'd at his resolution, and for the loss *Spain* would sustain by his departure. Therefore he intreated him by no means to put his design in execution, for that he would go to the queen, of whom he hoped, that he being her father confessor, she would give credit to what he should say to her. Tho' the admiral was quite out of hopes and disgusted to see so little resolution and judgment in their highnesses counsellors, yet, being on the other side very desirous that *Spain* should reap the benefit of his undertakings, he complied with the father's desires and request, because he now look'd upon himself as a natural born *Spaniard*, because he had so long resided there: whilst he was following his project, and because he had got children there which was the cause he rejected the offers made him by other princes, as he declares in a letter he writ to their highnesses in these words, *that I might serve your highnesses, I have refused to take up with France, England and Portugal, the letters from which princes your highnesses may see in the hands of doctor Villan.*

CHAP. XIV.

*How the admiral returned to the camp before Granada, and took his leave of their catholic majesties, having concluded nothing with them.*

the admiral not agreeing with more discontent.  
**T**HE admiral departing from the monastery of *Rabida* near *Palos*, together with *F. John Perez*, to the camp of *S. Faith*, where their catholic majesties then were to carry on the siege of *Granada*, the said father further inform'd the queen, and press'd the business so home, that her majesty was pleas'd the conferences about the discovery should be renewed. But the opinions of the prior of *Prado* and others of his followers varying, and on the other side, *Columbus* demanding to be made admiral and vice-roy, besides other matters of great consequence; it was thought too much to grant him, because if what he propos'd succeeded, they judg'd his demand too considerable, and in case it did not, they thought it a folly to give such titles, which made the business come to nothing. I

cannot forbear declaring that I make great account of the admiral's wisdom, resolution and foresight, for he being so unfortunate in this affair, having so earnest a desire, as I have said before, to remain in this kingdom, and being reduced to such a condition, that he ought to take up with any thing; it was a greatness of spirit in him not to accept of any but great titles and honours, demanding such things as if he had foreseen and been most certainly assured of the success of his project, he could not have articul'd better, or more honourably than he did, so that at last they were forced to grant, that he should be admiral on the ocean, and enjoy all the allowances, privileges and prerogatives, that the admirals of *Castile* and *Leon* had in their several seas, and that all civil employ-

## The first Discovery of

ments, as well of government as administration of justice, in all the islands and continent should be wholly at his disposal, and that all government should be given to one or three persons he should name; and that he should appoint judges in all parts of *Spain* trading to the *Indies*, who should decide all matters relating to those parts. As for profit and revenue, he demanded, over and above the salary and perquisites of the aforesaid employments of admiral, vice-roy and governor, the tenth of all that was bought, bartered, found, or got within the bounds of his admiralship, abating only the charge of the conquest; so that had there been

1000 ducats in an island, one hundred were to be his. And because his adversaries said he ventured nothing in that undertaking, but had the command of a fleet as long as it lasted, he demanded the eighth part of what he should bring home in his fleet, and he would be at the eighth part of the expence. These being matters of such great consequence and their highnesses refusing to grant them, the admiral took leave of his friends and went away towards *Cordeva*, to take order for his journey into *France*, for he was resolved not to return to *Portugal*, tho' the king had writ to him, as shall be said.

### C H A P. XV.

*How their catholick majesties sent after the admiral, and granted him all he demanded.*

*Reasons that prevailed with the queen.*

**I**T was now the month of *January*, in the year 1492, when the admiral departed from the camp of *St. Faith*, and that same day *Lewis de Santangel* before mentioned, who did not approve of his going away, but was very desirous to prevent it; went to the queen, and using such words as his inclination suggested to persuade and reprove her at once, said, he wondered to see that her highness, who had always a great soul for all matters of moment and consequence, should now want the heart to venture upon an undertaking, where so little was ventured, and which might redound so much to the glory of god and propagation of the faith, not without great benefit and honour to her kingdoms and dominions; and such in short, that if any other prince should undertake it, as the admiral offered, the damage that would accrew to her crown was very visible, and that then she would with just cause be much blam'd by her friends and servants, and reproached by her enemies, and all people would say, she had well deserv'd that misfortune; and tho' she herself should never have cause to repent it, yet her successors would certainly feel the smart of it. Therefore, since the matter seemed to be grounded upon reason, and the admiral who proposed it was a man of sense and wisdom, and demanded no other reward but what he should find, being willing to bear part of the charge, besides venturing his own person; her highness ought not to look upon it as such an impossibility as those scholars made it, and that what they said that it would be a reflexion on her if the enterprise did not succeed, as the admiral proposed, was a

folly, and he was of a quite contrary opinion, rather believing they would be look'd upon as generous and magnanimous princes, for attempting to discover the secrets and wonders of the world, as other monarchs had done, and it had redounded to their honour. But tho' the event were never so uncertain, yet a considerable sum of money would be well employ'd in clearing such a doubt. Besides that, the admiral only demanded 2500 crowns to fit the fleet, and therefore she ought not to despise that undertaking, that it might not be said it was the fear of spending so small a sum that kept her back. The queen knowing the sincerity of *Santangel's* words, answered, thanking him for his good advice, and saying, she was willing to admit of the proposals, upon condition the execution were respited, till she had a little breathing after the war. And yet if he were of another opinion, she was content that as much money as was requisite for fitting out the fleet should be borrowed upon her jewels. But *Santangel* seeing the queen had upon his advice condescended to what she had refused to all other persons, replied, there was no need of pawning her jewels, for he would do her highness that small service as to lend his money. Upon this resolution the queen immediately sent an officer post, to bring the admiral back, who found him upon the bridge of *Pinos*, two leagues from *Granada*; and tho' the admiral was much concerned at the difficulties and delays he had met with in his enterprise, yet understanding the queen's will and resolution, he returned to the camp of *St. Faith*, where he was well entertained by their catho-

lick majesties, and his dispatch and articles committed to the secretary *John Coloma*, who by their highnesses command and under their hand and seal, granted him all the

articles and clauses we said above, he had demanded, without altering or diminishing any thing in them.

CHAP. XVI.

*How the admiral fitted out three caravals to go upon his discovery.*

The admiral sets sail.

THE aforesaid articles being granted by their catholic majesties, he set out from *Granada* on the 12th of *May*, this year 1492, for *Palos*, the port where he was to fit out his ships, that town being oblig'd to serve their highnesses three months with two caravals, which they ordered should be given to the admiral. These and another ship be fitted out with all care and diligence. The ship he went in was call'd the *St. Mary*, another was *La Pinta*, whereof *Martin Alonso Pinzon* was captain, and *Vincent Yanez Pinzon*, brother to *Alonso*, both of the town of *Palos*, of the 3d which was call'd *La Nina*, and had square sails. They being furnished with all necessities, and 90 men, set sail directly towards the *Canaries* on the 3d of *August*, and from that time forwards, the admiral was very careful to keep an exact

journal of all that happened to him during the voyage, specifying what wind blew, how far he sail'd with every wind; what currents he found, and what he saw by the way, whether birds, or fishes, or other things; which he always did in four voyages he made from *Spain* to the *Indies*. I will not write all those particulars; for tho' to give an account of his voyage, and to shew what impressions and effects answered the course and aspects of the stars, and to relate what difference there is between that and our sea and our countries, would be now very beneficial; yet I do not think all those particulars would now be pleasing to the reader, whom such long and superfluous relations must tire. Therefore I shall only discourse of those things I shall think necessary and convenient.

CHAP. XVII.

*The admiral arriv'd at the Canary islands, and there furnish'd himself completely with all he wanted.*

The rudder of a caraval gets broke.

THE next day after the admiral's departure for the *Canary* islands, being *Saturday* the 4th of *August*, the rudder of one of the caravals, call'd *La Pinta*, broke loose, and being therefore forced to lie by, the admiral soon came by her side, but the weather blowing hard, could give no assistance; yet commanders at sea are oblig'd so to do, to encourage those that are in distress. This he did the more readily, as misfouling this had happened by the contrivance of the master, to avoid going the voyage, as he attempted to do before they set out. *Pinzon* the captain being an able seaman, soon repaired that fault with the help of some ropes, so that they were able to continue their voyage, till on *Tuesday* following, the weather being rough, the ropes broke, and they were forced again to lie by to mend what had given way. From which misfortune of breaking of the rudder twice, any body that had been superstitious, might have foreboded its future disobedience to the admiral, when thro' the malice of *Pinzon*, it twice

got away from him, as shall be mentioned hereafter.

To return to what we have in hand, they apply the best remedy they could for the present, that they might at least reach the *Canary* islands, which all three ships discovered on *Thursday* the 9th of *August* about break of day, but the wind being contrary, they could not come to an anchor at *Gran Canaria*, tho' very near it, that day nor the two following. Here the admiral left *Pinzon*, that going ashore he might endeavour to get another ship; and he to the same purpose went away to the island *Gomera*, with the caraval call'd *La Mina*, that if they fail'd of a vessel in one island, they might find it in the other. Thus he came to *Gomera* on the *Sunday* following, being the 12th of *August*, and sent his boat ashore, which return'd in the morning, with the news that there was never a vessel in the island at that time, but that they hourly expected the lady *Beatriz de Bobadilla*, proprietress of that same island, who was then at *Gran Canaria*,

The admiral at Gomera.

## The first Discovery of

and had hired a vessel of 40 tun, belonging to one *Gradenna* of *Seville*, which being fit for the voyage he design'd, he might have taken. Therefore the admiral resolv'd to expect him in that port, believing that if *Pinzon* had not been able to repair his own vessel, he might himself have got another at *Gomera*. Having stay'd there the two following days, and the vessel above mentioned not appearing, he sent a man aboard a bark that was bound from *Gomera* to *Gran Canaria*, to acquaint *Pinzon* where he lay, and assist him in fixing his rudder, writing to him that he did not go himself to assist him, because that vessel could not fail. But it being long after the departure of that bark, before the admiral received any answer, he resolv'd on the 23d of *August* to return with his two vessels to *Gran Canaria*, and failing the next day, met in the way the aforementioned bark, which was not yet arriv'd at *Gran Canaria*, by reason of the contrary winds. Having taken out the man he had sent aboard the bark, that night he sail'd close by *Tenerife*, where they saw flames gush out of the high rock commonly call'd the *Peake*, or rather *El Pico*, which his men admiring at, he told them the occasion of

At *Gran Canaria*.

that fire, proving what he said by the example of mount *Etna* in *Sicily*, and of many others like it. Leaving that island they arriv'd at *Gran Canaria* upon *Saturday* the 25th, whither *Pinzon* with much difficulty was got in but the day before. By him he was inform'd that the lady *Beatrix* was sail'd the *Monday* before, with that vessel he took such pains to get, and the others being much troubled at it, he made the best of whatever happen'd; affirming, that since it did not please God he should meet with that vessel, it was perhaps because in finding it, he would at the same time have met with some obstacle or opposition in pressing of it, and have lost time in shipping and unshipping the goods, which would be a hindrance to his voyage: for this reason, fearing if he returned to seek it at *Gomera*, he might miss of it by the way; he resolv'd to repair his caraval the best he could at *Gran Canaria*, making a new rudder, she having lost hers, and to change the sails of the other caraval call'd *La Nina*, which were square, to round, that she might follow the other ships with less danger and agitation.

## C H A P. XVIII.

*How the admiral set sail from the island of Grand Canaria upon his discovery and what happened to him on the ocean.*

WHEN the ships were refitted and in order to sail on *Friday*, (this by what follows ought to be *Saturday*) the first of *September*; in the afternoon the admiral weigh'd anchor, and departed from *Gran Canaria*, arriving the next day at *Gormra*, where four days more were spent in laying in provisions, wood and water; so that next *Thursday* in the morning which was on the 6th of *September* 1482, which may be accounted the first setting out upon the voyage on the ocean, the admiral departed from *Gomera*, and stood away to the westward, but made but little way by reason of the calm. On *Sunday* about day, he found himself nine leagues west of the island *Ferro*, where they lost sight of land, and many fearing it would be long before they should see it again, sigh'd and wept, but the admiral after comforting them all with great promises of lands, and wealth to raise their hopes, and lessen the fear they had conceived of the length of the way, tho' they sail'd 18 leagues that day, he pretended by his computation it was but 15, resolv'd all the voyage to keep short in his reckoning,

The admiral sails westward.

that his men might not think themselves so far from *Spain* as they were, if he should truly set down the way he made, which yet he privately mark'd down. Continuing thus his voyage, on *Wednesday* the 12th of *September*, about sun-setting, being about 150 leagues west of the island *Ferro*, he discovered a large body of the mast of a tree of 120 tun, which seem'd to have been a long time upon the water. There and somewhat further the current set strong towards the north east, but when he had run 50 leagues farther westward, on the 13th of *September*, he found that at night fall, the needle vary'd half a point towards the north-east, and at break of day, half a point more, by which he understood that the needle did not point at the north star, but at some other fix'd and visible point. This variation no man had observ'd before, and therefore he had occasion to be surpriz'd at it, but he was more amaz'd the 3d day after, when he was almost 100 leagues further; for at night the needles vary'd about a point to the north east, and in the morning they pointed upon the star. On *Saturday*

day the 15th of September, being almost 300 leagues west of *Ferro*, at night they saw a wonderful flash of light fall from the sky, into the sea, about four or five leagues distance from the ships towards the south-west, tho' the weather was then fair, like April, the wind favourable at north east, the sea still, and the current setting north-east. The men aboard the caraval call'd *la Ninna*, told the admiral, they had the Friday before seen a heron and another sort of bird, which the Spaniards call *Rabo de Junco*, which they were amaz'd at, those being the first birds they had seen: but they were more surpris'd the next day, which was Sunday, at the great abundance of weeds between green and yellow, that appeared upon the water, which seem'd to be newly wash'd away from some island or rock. They saw enough of these weeds the next day, which made many affirm they were already near land, especially because they saw a small lobster alive among those weeds, which they said somewhat resembled the herb *Star-wort*, but that the stalk and branches were long, and it was all full of small feeds. Afterwards they observed that the sea-water was but half as salt as before: besides, that great abundance of *Tunny* fishes follow'd them, running along, and sticking

so close to them, that those aboard the caraval *Ninna*, kill'd one with a bearded iron. Being now 360 leagues west of *Ferro*, they saw another of those birds the Spaniards call *Rabo de Junco*, because of a long feather their tail consists of, and in Spanish, *Rabo* signifies a tail, as *Junco* is a rush, so that *Rabo de Junco* imports rush tail. On Tuesday following, being the 18th of September, *Martin Alonso Pinzon*, who was gone a-head with the caraval call'd *Pinta*, which was an excellent sailer, lay by for the admiral, and told him he had seen a great number of birds fly away westward, for which reason he hop'd to find land that night, and he thought he saw the land to the northward, 15 leagues distant; that day about sun-setting, looking very dark and cloudy. But the admiral knowing for certain it was no land, he would not lose time to discover it, as all his men would have had him; forasmuch as he was not yet come to the place where he expected by his computation to find land, therefore they took in their top-sails at night, because the wind freshen'd, having for eleven days never abated one handful of sail, going still before the wind westward.

CHAP. XIX.

*How all the men carefully observed what signs they discovered, being eager to discover land.*

ALL the men aboard the ships being unacquainted with that voyage, and fearfull of the danger, because far from any relief, there were some that began to mutter, and seeing nothing but sky and water, carefully observed every thing that appear'd, at greater distance from land, than any had been before. For which reason I will relate all they made any account of, and this only in the first voyage, for I shall not mention lesser tokens generally seen upon such occasions. On the 19th of September, in the morning, a fowl call'd *Alcatraz*, which is a sort of sea gull, flew over the admiral's ship, and others in the afternoon, which made him conceive hope of land, he imagining they would not fly very far from it. Upon these hopes, as soon as the wind abated, they sound'd with 200 fathom of line; and tho' they found no bottom, they perceived the current now set south-west. On Thursday the 22d, two hours before noon, two *Alcatrazes* came to the ship, and another some time after; besides, they took a bird like a heron, but that it was black, and had a white tuft on the head, the feet

like a duck, as commonly water-fowls have; they also caught a little fish, and saw abundance of weeds; and about evening there came aboard three land-fowls singing, but at break of day they flew away, which was some comfort to them, considering that the other fowls being large, and used to the water, might better go far from land, but that these little ones could not come from any far distant country. Three hours after they saw another *Alcatraz*, that came from the W. N. W. and the next day after noon, they saw another *Rabo de Junco* and an *Alcatraz*, and there appear'd more weeds than before, towards the north, as far as they could see; which things sometimes were a comfort to them, believing they might come from some near land, and sometimes they caus'd dread, because they were so thick, that in some measure they staid the ships, and fear making things worse than they are, they apprehended that might befall them, which is fabulously reported of *St. Amaro* in the frozen sea, who is said not to suffer ships to stir backwards or forwards, and therefore they steer

Vol. II.

6 S ed

ed away from those shoals of weeds, as much as they could. But to return to the tokens. The next day they saw a whale, and on *Saturday* following, being the 23d of *September*, some small birds; and the wind those days blew at south-west, sometimes more and sometimes less west, which tho' contrary to their voyage, the admiral said he look'd upon as very good, and a help to them, because the men continually muttering, among other things that increased their fear, said this was one, That since the wind was always right a stern, they should never in those seas have a gale to carry them back; and tho' sometimes they found the contrary, they alledg'd that it was no settled wind, and that not being strong enough to swell the sea, it would never carry them back so far as they had to sail. Whatsoever the admiral could say, telling them that the reason was, the lands being now near,

*Muttering  
among the  
jermen.*

which did not suffer the waves to rise, and using the best argument he could, yet he affirms he stood in need of God's particular assistance, as *Moses* did when he led the *Israelites* out of *Egypt*, who forbore laying violent hands upon him, because of the prodigies God wrought by his means. So said the admiral, it happened to him in that voyage; for upon *Sunday* following, the wind started up at W. N. W. with a rowling sea, as the men wish'd, and three hours before noon, they saw a turtle fly over the ship, and about evening an *Alcatraz*, a river fowl, and other white birds, and some crabs among the weeds; and the next day they spy'd another *Alcatraz*, and several small birds that came from the west, and small fishes, whereof the men of the other vessels stuck some with harping irons, because they would not bite at the hook.

## CHAP. XX.

*How the men mutiny'd to turn back, and seeing other signs and tokens of land, went on well enough satisfied.*

*The men  
mutiny.*

THE more the afore said tokens were found vain, the more they took occasion to apprehend and mutter; caballing together, and saying, the admiral out of a foolish fancy of his own, had designed to make himself a great lord at the expence of their lives and danger; and since they had done their duty in trying their fortune, and had gone farther from land and any succour than any others had done, they ought not to destroy themselves, nor proceed in that voyage, since if they did, they should have cause to repent; for provisions would fall short, and the ships fail, which they knew were already so faulty, that it would be hard to get back so far as they were gone, and that none would condemn them for so doing, but they would rather be look'd upon as very brave men, for going upon such a design, and venturing so far; and that the admiral being a foreigner, and having no favour at court, and so many wise and learned men having condemn'd his opinion, there would be no body now to favour and defend him, and they should sooner find credit if they accused him of ignorance and mismanagement, than he whatsoever he could say for himself. Nor did there want some who said, that to end all dispute, in case he would not acquiesce to them, they might make short, and throw him overboard, and give out, that as he was making his observations he dropped into the sea, and no man would go about to enquire into the truth of it, which was the readiest way for them to return home and secure themselves.

Thus they went on from day to day, muttering, complaining and consulting together: nor was the admiral without apprehensions of their inconstancy, and ill intentions towards him. Therefore sometimes with good words, and sometimes with a full resolution to expose his life, putting them in mind of the punishment due to them if they obstructed the voyage, he in some measure quell'd their apprehensions, and suppress'd their ill designs. To confirm the hope he gave them, he put them in mind of the afore said signs and tokens, assuring them they would soon find land; which signs they were so attentive to, that they thought every hour a year till they saw land. On *Tuesday* the 25th of *September*, about sun-setting, as the admiral was discoursing with *Pinzon*, whose ship was very near, the said *Pinzon* on a sudden cry'd out, land, land, fir! Let not my good news miscarry: And shew'd him towards the south-west, a bulk which look'd very like an island, about 25 leagues from the ships. This was so pleasing to the men, that they returned thanks to God; and the admiral who had given no credit to these words, to please the men and that they should not obstruct his voyage, stood that way a great part of the night. Next morning they perceived that what they had seen were only clouds, which often look like land, for which reason, to the great dissatisfaction of most of the sailors, they turn'd the sterns of their ships westward, as they had always done, except when the wind hindred. Continuing still

waves to rise, and he could, yet he of God's particular when he led the who forbore laying h, because of the by his means. So opened to him in Sunday following, W. N. W. with a wish'd, and three saw a turtle fly evening an *Alca-* other white birds, the weeds; and another *Alcatraz*, at came from the whereof the men some with harp- would not bite at

Continuing still

still attentive to the signs; they saw an *Alcatraz*, a *Rabo de Junco*, and other birds like those above mentioned. On *Thursday* the 27th of *September* in the morning, they saw another *Alcatraz* coming from the west, and sailing eastward, and abundance of fishes with gilt backs appeared, whereof they struck one with a harping-iron. A *Rabo de Junco* flew by them, and they found that the currents, for those last days, were not so regularly fixt, as they used to be before, but turned with the tide, and there were not so many weeds as before. On *Friday* following, all the ships took some fishes with gilt backs, and on *Saturday* they saw a *Rabo de Junco*, which tho' it be a sea-fowl does not rest on it, but flies always in the air, pursuing the *Alcatrazes*, till it makes them drop their excrement for fear, which it catches in the air for its nourishment, and thus it maintains its self on the sea, and it is reported there are many of them about the Islands of *Cabo Verde*. Soon after they saw two other *Alcatrazes*, and abundance of flying fishes, which are about a span long, and have two little wings like a bat; they fly about a pike high from the water, and a musket-shot in length, more or less, and sometimes they drop upon the ships. Afternoon they saw abundance of weeds lying in length north and south, as they had

done before, besides three *Alcatrazes* and a *Rabo de Junco* that pursued them.

On *Sunday* morning four *Rabo de Juncos* came to the ship, by reason of whose coming so together, it was thought the land was nearer, especially because soon after there flew by four *Alcatrazes*, and abundance of weeds were seen in a line lying W. N. W. and E. S. E. and also a great number of those fishes they call *Emperadores*, which have a very hard skin, and are not fit to eat. How much soever the admiral regarded these tokens, yet he never forgot those in the heaven, and the course of the stars. He therefore observed in this place, to his great admiration, that the *Charles Wain* at night appeared in the west point, and in the morning they were directly N. E. by which he gathered, that their whole nights course was but three lines or nine hours, that is, so many parts of twenty four, and this he made out every night. He also perceived, that at night fall the compass varied a whole point to the north-west, and at break of day it came right with the star. These things confounded the pilots, till he told them the cause of it was the compass the star took about the pole, which was some satisfaction to them; for this variation made them apprehend some danger in such an unknown distance from home, and such strange regions.

## CHAP. XXI.

*How they saw not only the aforementioned signs and tokens, but others better than they, which were some comfort to the men.*

*They dis- agree in their com- putations.*

ON *Monday* the 11th of *October*, after sun-rising, an *Alcatraz*, came to the ship, and two more about ten in the morning, and long streams of weeds lay from east to west. That day in the morning the pilot of the admiral's ship said, they were 578 leagues west of the island *Ferro*, the admiral said by his account, they were 584 leagues, but in private he concluded it was 707, which is 129 leagues more than the pilot reckon'd. The other two ships differed very much in their computation, for the pilot of the caraval *Ninna* on *Wednesday* following afternoon said, they had sail'd 540 leagues, and the other of the caraval *Pinta* said 634. Adding all they had sail'd during those three days, they were still much short of truth, for they went always before the wind, and had run much more. But the admiral, as has been said, wink'd at this gross mistake, that the men might not be quite dejected, being so far from home. The next day, being the 2d of

*October*, they saw abundance of fish, catch'd a small tunny, and saw a white bird, and many other small ones, and the weeds they saw were withered and almost fallen to powder. The next day after, seeing no birds, but some fish, they mistrusted they had left some islands on both hands, and were slip'd between without discovering them; guessing that those many birds they had seen were passing from one island to another. They were very earnest to steer either one way or the other, to seek out those lands they imagined; but the admiral would not consent, being unwilling to lose the fair wind that carry'd him away to westward, which he accounted his surest course; and besides, because he thought it was a lessening the reputation of his undertaking, to run from one place to another, seeking that which he always affirmed he well knew where to find. For this reason the men were ready to mutiny, continuing to mutter and conspire against him; but it pleased God, as

was

was said above, to assist him by the means of fresh tokens; for on *Thursday* the 4th of *October*, afternoon, above forty sparrows together and two *Alcatrazes* flew so near the ships, that a seaman killed one of them with a stone; and before this they had seen another bird like a *Rabo de Junco*, and another like a swallow, and a great many flying fishes fell into the ships. Next day there came a *Rabo de Junco*, and an *Alcatraz*, from the westward, and abundance of sparrows were seen. On *Sunday* the 7th of *October*, about sun-rising, some signs of land appeared westward, but being imperfect, no man would speak of it, not so much for the shame that would follow of asserting what was not, as for fear of losing 30 crowns a year, their catholic majesties had promised for life, to him that should first discover land; and to prevent their crying land, land at every turn, as they might do without cause at every turn, out of covetousness of that allowance, it was ordered, that whosoever said he saw land, if it were not made out in three days after, should lose the reward, though afterwards he should prove the first discoverer. All aboard the admiral being thus forewarned, none of them durst cry out land; but those in the caraval *Ninna*, which was a better sailer, and kept a head, believing it to be certainly land, fired a gun, and put out their colours in token of land. But the farther they sailed, the more their joys vanished, till that appearance quite vanished, tho' it pleased God soon after to give them some manner of comfort, for they saw great flights of great fowl, and others of small land birds, flying from the west towards the south-west. Therefore the admiral being now so far from *Spain*, and sure that such small birds would not go far from land; he alter'd his course, which till then was west, and stood to the south-west, saying, that if he changed his road, it was, because he deviated but little from his first design, and

The admiral alters his course.

because he would follow the example of the *Portuguese*, who had discovered most of their islands by means of such birds, and the more because those they saw followed almost the same way; he had always proposed to himself to find land, according to the place they were then in; since as they well knew he had often told them, he never expected to find land till he was 750 leagues to the westward of the *Canaries*; within which distance he had farther said, he should discover *Hispaniola*, which he then call'd *Cipango*, and there is no doubt but he had found it, had not he known it was reported to lie in length from north to south: For which reason he had not inclined more to the south to run upon it, and therefore that and others of the *Caribbea* islands lay now on his larboard-side, south of him, whether those birds were directing their course. Being so near to land was the reason they continually saw such abundance of birds; and on *Monday* the 8th of *October*, there came to the ship twelve singing-birds of several colours, and after flying a turn about the ship, they held on their way. They also saw from the ships, many other birds flying towards the south-west; and that same night abundance of large fowls were seen, and flights of small birds coming from the northward, and flying after the rest. Besides, they saw a good number of tunny fish. In the morning they spy'd a jay, an *Alcatraz*, ducks and small birds, flying the same way the others had done; and they perceived the air to be fresh and odoriferous, as it is at *Sevil* in *April*. But they were now so eager to see land, that they had faith in no signs whatsoever; so that tho' on *Wednesday* the 10th of *October*, they saw abundance of birds pass by both day and night, yet the men did not cease to complain, nor the admiral to blame their want of courage; declaring to them, that right or wrong they must go on in discovering the *Indies*, their catholic majesties had sent them to.

## C H A P. XXII.

*How the admiral discovered the first land, which was an island called De Los Lucayos.*

THE admiral being no longer able to withstand so many as opposed him, it pleased God that on *Thursday* the 11th of *October*, afternoon, the men took heart and rejoiced, having manifest tokens that they were near land, which were that those aboard the admiral, saw a green rush swim by the ship, and then a great green fish of that sort, that goes not far from the rocks.

Other Tokens.

Those aboard the caraval *Pinta* saw a cane and a staff, and took up another staff curiously wrought, and a small board, and abundance of weeds fresh wash'd away from the banks. Those in the caraval *Ninna* saw other such like tokens, and a branch of a thorn full of red berries, which seem'd to be newly broke off. By these tokens, and reason it self, the admiral being assured

ured he was near land; at night, after prayers, he made a speech to all the men in general, putting them in mind how great a mercy it was that God had brought them so long a voyage, with such fair weather, and comforting them with tokens, which every day were plainer and plainer; therefore he pray'd them to be very watchful that night, since they well knew that in the first article of the instructions he gave each ship at the *Canary* islands, he ordain'd that when they had sail'd 700 leagues to the westward, without discovering land, they should lie by from midnight till day. Therefore, since they had not yet obtained their desires in discovering land, they should at least express their zeal in being watchful. And forasmuch, as he had most assured hopes of finding land that night, every one should watch in his place; for besides the gratuity their highnesses had promised of 30 crowns a year for life, to him that first saw land, he would give him a velvet doublet. After this, about ten at night, as the admiral was in the great cabin, he saw a light ashore, but said it was so blind, he could not affirm it to be land, tho' he called one *Peter Gutierrez*, and bid him observe whether he saw the said light, who

said he did; but presently they called one *Roderick Sanchez de Segovia*, to look that way, but he could not see it, because he came not up time enough where it might be seen; nor did they see it afterwards above once or twice, which made them judge it might be a candle or torch belonging to some fisherman or traveller, who lifted it up, and let it fall down; or perhaps that they were people going from one house to another, because it vanish'd and suddenly appeared again, so that few would guess but that they were near land. Being now very much upon their guard, they still held on their course, till about two in the morning the *Land light* <sup>covered</sup> *caraval Pinta*, which being an excellent failer, was far a-head, gave the signal of land, which was first discovered by a failer, whose name was *Roderick de Triana*, being two leagues from shore. But the thirty crowns a year was not granted by their catholic majesties to him, but to the admiral, who had seen the light in the midst of darkness, signifying the spiritual light he was then spreading in those dark regions. Being now near land, all the ships lay by, thinking it a long time till morning, that they might see what they had so long desired.

CHAP. XXIII.

*How the admiral went ashore, and took possession for their catholic Majesties.*

St. Salvador the island named. DAY appearing, they perceived it was an island fifteen leagues in length, plain, without hills and full of green trees, and delicious waters, with a great lake in the middle, inhabited by abundance of people, who ran down to the shore, astonished and admiring at the sight of the ships, believing them to be some living creatures, and were impatient to know certainly what they were. Nor were the christians less hasty to know them, whose curiosity was soon satisfied, for they soon came to an anchor; the admiral went ashore with his boat well armed, and the royal standard display'd, as did the captains of the other two ships in their boats, with their particular colours of this enterprise, which were a green cross with an F on the one side, and on the other the names of *Ferdinand* and *Isabel* or *Elizabeth* crown'd. Having given thanks to God, kneeling on the shore, and kiss'd the ground with tears of joy, for the great mercy re-

ceived, the admiral stood up, and called that island *St. Salvador*. After that he took possession for their catholic majesties, in the usual words, and with the solemnity proper in those cases; abundance of the natives that were come out, being present, and consequently the christians admitted him as admiral and viceroy, and swore to obey him as representing their highnesses persons, and with such expressions of joy, as became their mighty success, all of them begging his pardon for all the affronts they had done him thro' their fear and irresolution. Abundance of the *Indians* being come down to this rejoicing, and the admiral perceiving they were peaceable, quiet and very simple people, he gave them some red caps, and strings of glass beads, which they hung about their necks, and other things of small value, which they valued as if they had been stone of high price.

## CHAP. XXIV.

*The manners and customs of those people, and what the admiral saw in that island.*

*Descripti-  
on of the  
Islanders.*

THE admiral being gone off to his boats, the Indians follow'd him to them and to the ships swimming, and others in their canoes, carrying parrots, bottoms of spun cotton, javelins, and other such trifles to barter for glass-beads, bells, and other things of small value. Like people in their original simplicity, they went naked as they were born, and a woman that was among them had no other cloathing. Most of them were young, not above thirty years of age; of a good stature, their hair lank, thick, very black and short, being cut above their ears, except some few who had let it grow down to their shoulders, and had ty'd it with a strong thread about their head like women's tresses. Their countenances were pleasant, and their features good, but their too high foreheads made them look somewhat wild. They were of a middle stature, well shaped, plump, but of an olive colour, like the people of the *Canaries* or peasants that are sun-burn'd. Some were painted with black, some with white and others with red; some only the faces, others the whole body, and others nothing but the eyes and nose. They had no weapons like our men, nor knowledge of them; for when the christians shew'd them a naked sword, they took it simply by the edge. Nor had they any knowledge of iron, and therefore they made their javelins we mentioned, of wands, with the points hardened at the fire, arming them with a fish bone instead of iron. Some of them having scars of wounds about them, and being ask'd by signs how they came by them, they answered by signs, that people came from other islands to take them away, and they received those wounds in their own defence. They seem'd ingenious and of a voluble tongue, for they easily repeated the words they once heard. There were no sort of creatures there but parrots, which they carried to barter among the other things we have spoke of, and in this trade they continued till night. Next day being the 13th of *October* in the morning, many of them came down to the shore, and went aboard in their boats called canoes, which were made of one piece, being the body of a tree hol-

low'd like a tray. The biggest of them were so large, they contained 40 or 45 men, and so less and less, till some would hold but one. They row'd with a paddle like a baker's peal, or those they use in dressing hemp; true it is, that the oars are not fixed on the side with pins to turn as ours are, but they dip them in the water, and pull back as if they were digging. These canoes are so light and so artificially built, that if they overfet they soon turn them right again swimming, and empty the water by throwing the vessel from side to side like a weaver's shuttle; and when it is above half out, they lade out what remains with dry'd calabashes cut in two, which they carry for that purpose. That day they brought such things to barter for as they had the day before, giving all they had for any small things they could get. Jewels or any sort of metal were not seen among them, except some small plates of gold which hung at their nostrils, and being asked whence they had that gold, they answered by signs, towards the south, where there was a king who had abundance of pieces and vessels of gold, expressing that towards the south and south-west, there were many other islands and large countries. Being very covetous of any thing of ours, and being themselves but poor, and having nothing to give in exchange, as soon as they came aboard, if they could lay their hands on any thing, tho' it were but a piece of a broken earthen glazed dish or porringer, they leaped into the sea and swam ashore; and if they brought any thing aboard, they would give it for any trifling thing of ours, or bit of broken glass, so that some of them gave 16 bottoms of cotton for three small pieces of *Portuguese* brass coin not worth a farthing; these bottoms weighed 25 pounds, and the cotton was very well spun. Thus they spent the day, and at night they all went ashore. It is to be observed, that their liberality in dealing did not proceed from the great value they put upon those things themselves, which they had of our men, but because they valued them as being ours, looking upon it as most certain that our men were come down from heaven, and therefore they earnestly desired to have something left them as a memorial.

Concept-  
on Island.

Island Fer-  
nandina.

NEXT Sunday, being the 15th of October, the admiral run along the coast of the island, towards the north-west, in his boats, to discover something about it; and that way he went, he found a large bay or harbour, capable of containing all the ships in christendom. The people seeing him scour along, ran after, along the shoar, crying out, and promising to give him provisions, calling others to come to see the people drop'd from heaven upon earth, and lifted up their hands to heaven, as it were giving thanks for their coming. Many of them swimming, or in their canoes, as best they could, came to the boats, asking by signs, whether they were come down from heaven, and praying them to land and rest themselves. The admiral gave them all glass beads, pins, and other trifles, rejoicing at their great simplicity, till he came to a *Peninsula*, which made a good port, and where a good fort might be made. There he saw six houses of the *Indians* with gardens about them, as pleasant as they are in *Castile* in May. But his men being weary of rowing, and he plainly perceiving that was none of the land he looked for, nor so beneficial, as that he should make any longer stay there, he took seven of those *Indians* to serve him as interpreters; and returning to his ships, sailed for other islands that could be discovered from the *Peninsula*, and appeared to be plain, green and very populous, as the *Indians* themselves affirm'd. The next day being Monday, the 16th of October, he came to one that was seven leagues from the other, and called it *St. Mary of the Conception*. That side of this island next *St. Salvador* extended north-west five leagues in length, but the admiral went to that side which lies east and west, and is above 10 leagues in length; and being come to an anchor towards the west, landed to do as he had done in the other. Here the people of the island ran together to see the christians, admiring as the others had done. The admiral perceiving this was the same thing as the last: The next day being Tuesday, sail'd westward to another island considerably bigger, and anchored upon the coast of it, which runs north-west and south-east, above 28 leagues. This was like the others, plain, had a fine strand, and was called *Fernandina*. Before they came to this island, and that of the *Conception*, they found a man in a small canoe, who had a piece of their bread, and

a calabash of water, and a little earth like vermillion, wherewith those people paint their bodies, as was said above; and some dry leaves which they value, as being of a sweet scent and wholesome; and in a little basket he had a string of beads of green glass, and two small pieces of *Portuguese* money, by which it was guessed that he was coming from *St. Salvador*, that he had pass'd by the *Conception*, and was going to *Fernandina* to carry news of the christians: But because the way was far, and he weary, he came to the ships, was taken up with his canoe, and courteously treated by the admiral, designing as soon as he came to land to send him ashore, which he did, that he might spread the news. The good account he gave, caused the people of *Fernandina* to come aboard in their canoes, to exchange the same sort of things the others had done before, for these people were like the rest; and when the boat went ashore for water, the *Indians* very readily show'd where it was, and carry'd a small cask full on their shoulders to fill the hogheads in the boat. They seem'd to be a wiser and discreeter people than the first, and as such bargain'd harder for what they exchanged, had cotton cloath in their houses, and bed-cloaths; and the women covered their privities with short hanging cotton-cloaths, and others with a sort of swathe. Among other notable things they saw in that island, were some trees which seem'd to be grafted, because they had leaves and branches of four or five several sorts, and yet were natural. They also saw fishes of several shapes and fine colours, but no sort of land creatures but lizards and snakes. The better to discover the island, they sail'd away north-west, and came to an anchor at the mouth of a beautiful harbour; at the entrance whereof was a small island, and therefore they could not get in, there being but little water; nor did they much care, because they would not be far from a town that appeared at a distance: For in the biggest island they had yet seen they had not found above 12 or 15 houses together, built like tents, in which they saw no other ornaments or moveables, but what they carry'd to the ships to exchange. Their beds were like a net, drawn together in the nature of a sling tied to two posts in their houses, in which they lie. Here they saw some dogs like mastiffs, and others like beagles, but none of them bark'd.

## C H A P. XXVI.

*How the admiral sailed by other islands that were in sight where he was.*

*Island of Isabella.*

Finding nothing of value in this island, *Fernandina*, on Friday the 19th of October, they sailed away to another, called *Saomotto*, to which he gave the name of *Isabella*, to proceed regularly in his names; for the first which the *Indians* call'd *Guanabani*, he call'd *St. Salvador*, or *St. Saviour* in honour of god, who had show'd it and delivered him from many dangers. The second for his particular devotion, to the conception of the virgin *Mary*; and because she is the great patroness of christians, he called *St. Mary of the Conception*; the third he called *Fernandina*, in honour of the catholick king, and the fourth *Isabella*, in remembrance of the catholick queen; and the next after it which was *Cuba*, he stiled *Joanna*, in respect to prince *John*, heir of *Castile*, having in these names regard both to spirituals and temporals. True it is, that as to goodness, extent, and beauty, he said this *Fernandina* far exceeded the others; for besides that it abounded in delicious waters, pleasant meadows and trees, among which were many of *Aloes*; there were in it some hills, which the others wanted, being very plain. The admiral enamoured with its beauty, and to perform the ceremony of taking possession, landed upon some meadows as pleasant and delightful as they are in *Spain* in April; and there was heard the singing of nightingales and other birds, so sweet, that

he could scarce depart. Nor were they only about the trees, but flew thro' the air in such swarms, that they darkened the sun, and most of them differed much from our birds. There being abundance of waters and lakes; near to one of them they saw a sort of alligator seven foot long, and above a foot wide in the belly, which being disturbed by our men, threw its self into the lake. But it not being deep, they killed it with their spears, not without dread and admiration, because of its fierce and frightful look. Time afterwards made them look upon this as a dainty, it being the best food the *Indians* had; forasmuch as when that horrid skin, and the scales that cover it are taken off, the flesh is very white and very delicious, the *Indians* call them *Yvanas*. Being very desirous to know more of that country, and it being then late, they left that creature for the next day, when they killed another, as they had done the first; and travelling up the land found a town, the people whereof fled, carrying away as much of their goods as they could. The admiral would not suffer any thing of what they had left to be taken away, lest they should look upon the christians as thieves. Therefore their fear being soon over, they came of their own accord to the ships to barter, as the others had done.

*Yvanas.*

## C H A P. XXVII.

*How the admiral discovered the island of Cuba and what he found there.*

*Island of Cuba.*

THE admiral having learned the secrets of the island *Isabella*, its product, and the manners of the people, would lose no more time among those islands, because they were many and like one another, as the *Indians* said. He therefore set sail with a fair wind for a very large country, much applauded by them all, called *Cuba*, which lay towards the south, and on Sunday the 28th of October, he came up with the coast of it, on the north side. This island at first sight appeared to be better and richer than those before named, as well by reason of the beauty of its hills and mountains, as for the variety of trees, the large plains, and the greatness and extent of its coasts and rivers. Therefore to get some knowledge of its people, he came to an anchor in a large river, where the trees were very thick and

tall, adorned with fruit and blossoms, differing from ours, and where there were abundance of birds, the place most delicious, for the grass was high, and nothing like ours; and tho' there were several sorts of herbs known to us, yet the great variety made our men not know them. Going to two houses that were not far off, they found the people were fled for fear, and had left their nets, and all other fishing tackle, and a dog that did not bark. As the admiral had ordered, nothing was touched, for it was enough for him at present to see what their food and necessaries were. Returning to their ships they held on their course westward, and came to another river, which the admiral called *de Mares*, or of seas. This much exceeded the other, because a ship could turn it

it up, and the banks were much inhabited; but the people seeing the ships, fled towards the mountains, which appear'd, and were high, round, and covered with trees and pleasant plants, whither the *Indians* convey'd all they could carry away. The admiral being disappointed, by the peoples fear, of learning any thing of the nature of the island, and considering if he landed with many men, it would increase their terrour, he resolv'd to send two christians, with one of the *Indians* he brought from

*St. Salvador*, and with one of that country, who ventured to come aboard in his canoe. These he ordered to travel up into the country, making much of the natives they met by the way, and that no time might be lost, whilst they were going, he order'd the ship to be lay'd ashore to careen her, where they observed that all the fire they made was mastick, whereof there was plenty all the country over. This tree is in all respects like our mastick tree, but much bigger.

C H A P. XXVIII.

*How the two christians return'd, and the report they made of what they had seen.*

*A town in Cuba.*

THE ship being repaired and ready to sail, the christians returned with two *Indians* on the 5th of *November*, saying, they had travell'd twelve leagues up the land, and came to a town of 50 pretty huge houses, all of timber covered with straw, and made after the manner of pavillions, like the others; that they contain'd about 1000 people, because all that were of one family liv'd in a house, that the principal men of the place came out to meet them, and led them by the arms to their town, giving them one of those great houses to lodge in, where they made them sit down upon seats made of one piece, in strange shapes, and almost like some creature that had short legs, and the tail lifted up to lean against, which is as broad as the seat for the conveniency of leaning, with a head before, and the eyes and ears of gold. These seats they call *Duchi*, where the christians being seated, all the *Indians* fate about them on the ground, and then came one by one to kiss their hands and feet, believing they came from heaven; and they gave them some boil'd roots to eat, not unlike chestnuts in taste; earnestly entreating them to stay there among them, or at least to rest themselves 5 or 6 days, because the two *Indians* they took with them, gave those people an excellent character of the christians. Soon after, many women coming in to see them; the men went out, and these with no less respect, kiss'd their feet and hands, offering them what they brought. When their time came to return to the ships, many *Indians* would go along with them, but they would admit only of the king, his son and one servant, whom the admiral did much honour to; and these christians told him, that in their way out, and return, they had found several towns, where they were en-

tain'd with the same courtesy, but that there were not in them above five houses together: Besides, that by the way they met many people, who always carried a lighted firebrand, to light fire and perfume themselves with certain herbs they carried along with them, and to roast some of those roots they gave them; so far as that was their principal food. They also saw very many sorts of trees and plants, which were not to be seen about the sea-coast; and great variety of birds, far differing from ours, but that among them that were partridges and nightingals. As for four-footed creatures, they had seen none but dumb dogs. That there was a great deal of till'd land, some sow'd with those roots, a sort of beans, and a sort of grain they call *Maiz*, which was well tasted, bak'd, or dry'd and made into flour. They saw vast quantities of cotton well spun, in bottoms, in so much that in one house only, they saw above 12500 pounds of it. The plants it comes from are not set, but grow naturally about the fields, like roses, and open of themselves, when they are ripe, but not all at the same time; for upon one and the same plant, they had seen a little young bud, another open, and a third coming ripe. Of these plants the *Indians* afterwards carried great quantities aboard the ships, and gave a basket full for a thong of leather; yet none of them make use of it to cloath themselves, but only to make nets for their beds, which they call *Hamacas*, and in weaving aprons for women to cover their nakedness. Being ask'd whether they had gold or pearls, or spice, they made signs that there was great plenty towards the east, in a country they call'd *Bubia*, which is the island of *Hispaniola*, but it is not yet certainly known what place they meant.

## The first Discovery of

## C H A P. XXIX.

*How the admiral desisted from following the western coast of Cuba, and turn'd eastward towards Hispaniola.*

*Conjugal  
affection in  
an Indian.*

THE admiral having this account, and resolving to stay no longer in that river, order'd some natives of that island to be taken, designing to carry some from all parts into *Spain*, to give an account of his country; and accordingly 12 were seiz'd, men, women, and children, and this so peaceably and without any disturbance, that when they were ready to sail with them, the husband of one of the women, and father of two children that had been carry'd aboard, came to the ships in a canoe desiring he might be taken along with them, and not parted from his wife and children, which extremely pleas'd the admiral, who order'd he should be receiv'd, and they all well us'd and made much of. That same day, being the 13th of *November*, he came about to the eastward, designing for the island they call'd *Bobio*. The wind blowing hard at north, he was forced to come to an anchor again in the same island of *Cuba*, among some high islands, lying near a large port, which he call'd *del Principe*, or the princes port, and the sea, *Our Lady's*. These islands lay so thick and close, there was not above a quarter of a league distance between them at furthest, and but a musquet shot for the most part. The channels were so deep, and so well adorn'd with trees and greens, that it was very delightful going among them; and among the multitude of other trees, there were abundance of mastic, aloes and palm, the trunk green and smooth, and other plants of sundry sorts. And tho' these islands were not

inhabited, yet there appeared the tokens of many fires made by fishermen; for as it afterwards appear'd, the people of *Cuba* went together in great number, in their canoes over to these islands, and abundance more that lie hereabouts uninhabited, and live upon the fish they catch, upon birds, crabs, and other things they find on the earth; forasmuch as generally the *Indians* eat abundance of filthy things, such as great spiders, worms that breed in rotten wood and other corrupt places, and abundance of fish almost raw; for as soon as taken, before they roast it, they digg out the eyes to eat, and many other such things they feed on, which, besides that they are nauseous, would kill any of us, should we eat them. They follow this fishing and birding according to the season, sometimes in one island, sometimes in another, as one that changes his diet, being weary of the last. But to return to the islands of *Our Lady's Sea*, in one of them the christians with their swords, kill'd a beast like a badger, and in the sea found much mother of pearl; and casting their nets, among many other sorts of fish they caught, one was like a swine, all cover'd with a very hard skin, no part whereof was soft but the tail. They also observ'd that in this sea, and the islands, the tide swell'd and fell much lower than in other places, where they had been till then, and their tides were quite contrary to ours; for it was low water when the moon was S. W. and by S.

*How the admiral set sail again eastward for Hispaniola, and one of the ships forsook him.*

*Martin Alonso  
leaves the  
admiral.*

ON Monday the 19th of *November*, the admiral departed from the princes port in *Cuba*, and the sea of *Our Lady*, steering eastward for the island of *Bobio* and *Hispaniola*, but the wind being contrary, he was forced to ply two or three days between the island *Isabella*, which the *Indians* call *Somoto*, and the said princes port, which lie almost north and south, about 25 leagues distant, in which sea he still found long traces of these weeds he had seen in the ocean, and he perceived they swam along the current, and never lay athwart it. During this time *Martin Alonso Pinzon* being inform'd by certain *Indians* he

had conceal'd aboard his caraval, that in the island *Bobio*, which we said was *Hispaniola*, there was great plenty of gold; covetously blinding him, on *wednesday* the 21st of *November*, he went away from the admiral without any stress of weather, or any other occasion, for he could have come up to him before the wind, but would not, and so making as much way as possibly he could, his vessel being an excellent sailer, he made forwards all *Tburjay*, whereas they had sail'd in sight of one another all the day before, and night coming on, he quite vanish'd. Thus the admiral was left only with two ships, and the weather not being

fit

fit for his vessels to sail over towards *Hispaniola*, he was forced to return to *Cuba*, to another port not far from the princes, which he call'd *St. Catharine's*, there to take in wood and water. In this port he accidentally saw signs of gold on some stones in the river where they were watering, and up the country there were mountains full of such tall pine trees, as would make masts for the biggest ships. Nor was there any want of wood for planks, to build as many ships as they would, and among them oaks, and others like those in *Castile*. But perceiving that all the *Indians* directed him to *Hispaniola*, he run along the coast 10 or 12 leagues farther towards the south-east, meeting all the way excellent harbours, and many large rivers. The admiral says so much of the delightfulness and beauty of that country, that I have thought fit here to set down his own words, speaking of the mouth of the river, which makes a harbour by him called *Puerto Santo*, or holy harbour. Thus he says, when I went with the boats before me to the mouth of the harbour towards the south, I found a river, up whose mouth a gally could easily row, and the way up it was such, that it was not to be discover'd but close by: the beauty of it invited me to go up a boats length, where I found from 5 to 8 fathom water; and proceeding, I went a considerable way up the river in the boats; because, as well the beauty and delightfulness of the river, and the clearness of the water, thro' which I could see the sand at the bottom; as the abundance of palm trees of several sorts, the finest and highest I had yet met with; the other, infinite number of large green trees, the birds, and the verdure of the plain, temp-

ted me to fix there for ever. This country, most serene princes, is so wonderfully fine, as far exceeds all other beauty and delightfulness, as the day in brightness exceeds the night. Therefore I often told my companions, that tho' I should never so much endeavour to give your highnesses a perfect account of it, my tongue and pen would always fall short of the truth. And to say the truth, I was astonish'd to see so much beauty, and know not how to express it; for I have writ of the other countries, of their trees and fruits, of the plants and ports, and of all that belong'd to them, as largely as I was able, yet not as I ought, since all men affirm'd it was impossible any other country could be more delicious. Now I am silent, wishing this may be seen by others, who will write of it, that they may prove how little credit is to be got more than I have done in writing or speaking of that place considering what it deserves. The admiral going on with his boats, saw a canoe among the trees in the port, drawn upon land under a bower, which canoe was made of the body of one tree, and as big as a twelve oar barge, and in some houses hard by, they found a ball of wax, and a man's skull in two baskets hanging at a post. The same they afterwards found in another house, which made our men judge, they were the skulls of the founders of those houses. No people appeared to receive any information of, for as soon as ever they saw the christians, they fled from their houses to other parts. Afterwards they found another canoe about 70 foot long, that would carry 50 persons, made like the other we spoke of before.

*A delicious country.*

*Two vast canoes.*

CHAP. XXXI.

*How the admiral sail'd over to Hispaniola, and what he saw there.*

*Hispanio-*  
THE admiral having sail'd 106 leagues eastward along the coast of *Cuba*, came to the east point of it, which he call'd *Alpba*. and on Wednesday the 5th of December, struck off to sail over to *Hispaniola*, distant 16 leagues from *Cuba* eastward, and by reason of some currents, could not reach it till the next day, when he put into port *St. Nicholas*, so call'd by him in memory of that saint, whose festival was that day. The port is large, deep, safe, and encompass'd with many tall trees, but the country is more rocky, and the trees are less, that is, like those of *Castile*, among which there were small oaks, myrtle and other shrubs, and a pleasant river ran along a

plain towards the port, all about which there were large canoes like 15 oar barges. The admiral not being able to meet with any of those people, ran along the coast northward, till he came to a port he call'd the *Conception*, which lies almost due south of a small island about the bigness of *Gran Canaria*, which was afterwards call'd *Tortuga*. Perceiving that this island *Bobio* was very large, and that the land and trees were like those of *Spain*; and that at one draught of a net they had taken several fishes, like those of *Spain*, as soles, salmon, pilchards, crabs, and some others, therefore on Sunday the 9th of December, they gave it the name of *Espannola*, as call'd in

*Tortuga.*

in *English*, *Hispaniola*. All of them being very desirous to enquire into the nature of this island; whilst the men were fishing on the shoar, three christians travelled along the mountain, and lighted on a company of *Indians*, as naked as those they had seen before, who seeing the christians draw near them, in a great fright, ran into the thickest of the wood, as having no cloaths to hinder them. The christians to get some information, ran after them, but could only overtake a young woman, who had a plate of gold hanging at her nose. She was carried to the ships, where the admiral gave her several baubles, as bells and glafs, and then sent her ashore without the least disgust offer'd her, ordering three *Indians* of those he brought from the other islands to go with her, and three christians, to the town where she dwelt. The next day he sent 11 men ashore well arm'd, who having travelled four leagues, found a fort of town or village of above 1000 houses, scattered about a valley, the inhabitants whereof seeing the christians, all fled to the woods. But the *Indian* guide, whom our men brought from *St. Salvador*, went after them, and said such things to them of the christians, affirming they were people come from heaven, that he persuaded them to turn back quietly and without any fear. Afterwards full of astonishment, they would lay their hands on our mens heads by way of honour, brought them to eat, and gave them all they desired, without asking any return, praying them to stay that night in their village. The christians would not accept of the invitation, but return'd to their ships carrying the news that the country was very pleasant, abounding in their provisions: that the people were whiter and handsomer, than any they had yet seen in other islands, and that they were tractable and courteous, and told them the country where the gold was found, lay farther eastward. The admiral hearing this account, set sail immediately, tho' the

wind was contrary, and on Sunday following, being the 15th of December, as he was plying between *Hispaniola* and *Tortuga*, he found one *Indian* alone in a little canoe, which they all wonder'd was not swallowed by the sea, the wind and the waves were so high. He took him into the ship, carried him to *Hispaniola*, and set him ashore with several gifts. He told the *Indians* how kindly he had been used, and spoke so well of the christians, that abundance of them came presently aboard, but they brought nothing of value, except some small grains of gold hanging at their ears and nostrils, and being ask'd whence they had that gold, they made signs there was a great deal higher up. The next day there came a great canoe from the island *Tortuga*, which was near the place where the admiral lay at anchor, with 40 men in it, at such time as the *Cacique* or lord of that port of *Hispaniola* was upon the shoar, bartering a plate of gold he had brought. When he and his saw the canoe, they all fate themselves down upon the ground, as a sign they would not fight. Immediately almost all those in the canoe landed, again whom the *Cacique* of *Hispaniola* got up alone, and with threatening words made them return to their canoe. Then he threw water over them, and taking up stones off the strand, cast them into the sea towards the canoe. But when they were all in submissive manner return'd to their canoe, he took up a stone and delivered it to one of the admiral's officers, to throw at those in the canoe, to express that he took the admiral's part against the *Indians*, but the officer did not throw, seeing they presently went off in their canoe. After this, discoursing about the affairs of that island, which the admiral had call'd *Tortuga*, he affirm'd there was more gold in it than in *Hispaniola*, and that in *Bahia* there was more than in any other, which was about 15 days journey from the place where they were.

#### C H A P. XXXII.

*How the principal king of the island came aboard, and of the state he came in.*

ON Tuesday the 18th of December, the king that came the day before, where the canoe of *Tortuga* was, and who lived 5 leagues from the place where the ships lay, came in the morning to the town near the sea, sent of the *Spaniards* at the same time being there by the admiral's order to see whether they brought any more gold. These seeing the king come, went to acquaint the admiral, saying he brought above 200 men a-

long with him, and that he came not a foot but was carry'd on a sort of palanquine by four men with great respect, tho' he was very young. This king being at a small distance from the ships having rested a little, drew near with all his men, concerning which, the admiral himself writes thus: There is no doubt but your highnesses had been very much pleas'd to have seen his gravity, and the respect his people pay'd him

him, tho' all naked. When he came a-board, and understood I was under deck, being then at dinner, he surpris'd me, sitting down by me, without giving me time to go out to receive him, or rise from table. When he came down he made signs to all his followers to stay above, which they did with great respect, sitting down upon the deck, except two ancient men that seem'd to be his counsellors, that sat down at his feet. They said this man was a *Cacique*. I order'd such meat as I was eating, to be brought him; they just tast'd of every thing, and sent the rest to their men, who all eat of it. The same they did as to drinking, for they only kiss'd the cup and gave it about. They were all wonderful grave, and spoke but few words, and those they utter'd, by what I could gather, were very deliberate and staid. The two old men observ'd the king's mouth, and spoke for and to him. After eating, one of his gentlemen with great respect brought him a girdle, not unlike those us'd in *Castile*, tho' differently wrought, which he took in his hand, and gave me with two pieces of wrought gold very thin. Of which gold I believe there is little here, and I guess'd that place was near to where they took it, which produced very much. I believing he would like a carpet or counterpan that lay on my bed, gave it him, together with some fine amber beads I had about my neck, with a pair of red shoes and a bottle of orange-flower water, with which he was wonderfully pleas'd, and both he and his counsellors express'd much concern because they did not understand me,

nor I them, tho' I made out, that if I wanted any thing, all the island was at my command. I presently brought out a letter-case, in which I carry'd a gold medal weighing 4 ducats, on which your highnesses effigies are cut, and shew'd it him, saying over again, that your highnesses were mighty princes, and possess'd the best part of the world, and shew'd him the royal standard, and the other of the cross, which he made great account of. Therefore turning to his counsellors, he said, your highnesses were certainly mighty princes, since you had sent me so far as from heaven thither, without any fear. Much more pass'd between us, which I did not understand, but perceiv'd they admir'd at every thing they saw; but it being then late, and he desiring to be gone, I sent him ashore very honourably in my boat, and caus'd several guns to be fired, and he being ashore got into his palanquine, attended by above 200 men, and a son of his was carried on a man of note's shoulders. He order'd all the *Spaniards* that were ashore, to have meat given them, and to be very courteously us'd. Afterwards a failer that met him on the way, told me, that every one of the things I had given him, were carry'd before him by a man of great worth, and that his son went not along with him on the road, but at some distance behind him with as many more attendance as he had, and a brother of his on foot, with near as many more, two great men leading him under the arms, to whom I had given some small matters when he came aboard after his brother.

C H A P. XXXIII.

*How the admiral lost his ship upon the flats thro' the carelessness of the sailers, and the assistance he receiv'd from the king of that island.*

THE admiral continuing the relation as above, says, That on *Monday* the 24th of *December*, the weather was very calm, without any wind hardly, but so much as carried him from *St. Thomas's* sea, to *Punta Santa*, or the holy cape, off which he lay by about a league, and about 11 of the clock at night he went to take his rest, for he had not slept in two days and a night; and the weather being calm, the seaman that was at the helm, left it to a grummet, which (says the admiral) I had forbid during the whole voyage, bidding them, whether the wind blew or not, never to leave the helm to a grummet. And to say the truth, I thought my self safe from flats and rocks; for that *Sunday* I sent my boats to the king, they went at least

three leagues and a half beyond the said *Punta Santa*; and the seamen had view'd all the coast, and the shoals that lie three leagues E. S. E. of that cape, and observ'd which way to sail, which I had not done during the voyage; and it pleas'd our lord, that at midnight, seeing me gone to bed, we being in a dead calm and the sea as still as the water in a dish, all the men went to rest, leaving the helm to a grummet. Thus it came to pass, that the current easily carried away the ship upon one of those shoals, which tho' it was night, made such a roaring noise, that they might be heard and discover'd a league off. Then the fellow who felt the rudder strike and heard the noise, began to cry out, and I hearing it, got up immediately; for none

6 X had

he came in.

ame not a foot palanquine by tho' he was ng at a small g rested a lit- men, concern- lf writes thus: highnesses had have seen his people pay'd him

Account of the Cacique or Indian king.

had yet perceived that we were a ground. Presently the master, whose watch it was, came out, and I order'd him and other failers to take the boat, and carry out an anchor a stern; whereupon he and others leap'd into the boat, and I believing they would have done as I ordered, they row'd away, flying with the boat to the other caraval, which was half a league off. I then perceiving they ran away with the boat, that the water ebb'd, and the ship was in danger, caus'd the masts to be cut down, and lightned her as much as I could to see to get her off; but the water still ebbing, the caraval could not budge, but turning athwart the streams, the seams open'd, and all below deck was full of water. Mean while the boat returned from the caraval to relieve me; for the men aboard perceiving the boat fled, would not receive it, which oblig'd it to return to the ship. No hopes of saving the ship appearing, I went away to the caraval to save the men, and because the wind blew from the land, and great part of the night was spent, and yet we knew not which way to get from among those flats; I lay by with the caraval till day appeared, and then I drew towards land within the shoals, having first sent *James de Arana* the provost, and *Peter Gutierrez* your highnesses secretary, to acquaint the king with what had happened, telling him, That as I was going to visit him in his own port, as he had desired the last Saturday, I had lost my ship opposite to his town, and a league and a half from it upon a flat. The king understanding it, with tears in his eyes, expressed much grief for our loss, and immediately sent a-

Great kindness of the Indians to the Spaniards.

board all the people in the place, with many large canoes. So they and we began to unload, and in a short time carried off all that was upon deck. The assistance this king gave was great; and afterwards he himself, with his brothers and kindred, took all possible care both aboard and ashore, that all things might be done orderly; and from time to time he sent some of his kindred weeping, to beg of me not to be dejected, for he would give me all he had. I do assure your highnesses, better order could not have been taken in any part of *Castile*, to secure our things; for we lost not the value of a pin, for he caus'd all our cloaths to be laid together near his palace, where he kept them till the houses were voided, which he had appointed for us. He placed armed men to keep them, who stood there all day and all night, and all the people lamented, as if our loss had concern'd them much; so loving, tractable and free from covetousness they are, that I swear to your highnesses, there are no better people, nor a better countrey in the world. They love their neighbour as themselves, and their conversation is the sweetest in the universe, being pleasant and always smiling. True it is, both men and women go as naked as they were born; yet, your highnesses may believe me, they have very commendable customs, and the king is serv'd with great state; and he is so staid, that it is a great satisfaction to see him, as it is to think what good memories these people have, and how desirous they are to know every thing, which moves 'em to ask many questions, and to enquire into the cause and effects of every thing.

## C H A P. XXXIV.

*How the admiral resolv'd to plant a colony where the king resided, and call'd it the nativity.*

ON Wednesday the 26th of December, the chief king of that countrey came aboard the admiral's caraval, and expressing much grief and sorrow, comforted him, offer'd all he would have, and saying he had already given the christians three houses to lay up all they got out of the ship, and that he had given them many more, had they stood in need of them. In the mean while a canoe came with some *Indians* from another island, bringing some plates of gold to exchange for bells, which they valued above any thing. Besides the seamen came from shore, saying abundance of *Indians* resorted from other places to the town, who brought several things in gold and gave them for points, and other things

of small value, offering to bring much more if the christians would. Which the great *Cacique* perceiving was pleasing to the admiral; he told him he would cause a great quantity to be brought from *Cibao*, a place that yielded much gold. Being ashore, he invited the admiral to eat *Axis* and *Cazabi*, which is their principal diet, and gave him some vizor masks, with the eyes, nose and ears of gold, and other pretty things which they hung about their necks. Then complaining of the *Carribbes*, who carried away his men to make slaves and eat them, he was much comforted, when the admiral comforting him, show'd him our weapons, saying, he would defend him with them. He was much a-

stonish'd

stonish'd at our canon, which so terrified them, that they fell down as if they were dead, when they heard the report. The admiral therefore finding so much kindness among those people, and such signs of gold, almost forgot the grief conceiv'd for the loss of his ship; thinking God had permitted it that he might fix a colony there, and leave christians to trade, and get farther knowledge of the people and country, learning the language, and conversing with the natives, that when he returned from Spain with succours, he might have some body to direct him in his affairs, for peopling and subduing that country. To this he was the more inclined, because many voluntarily offered themselves to stay and inhabit there. For this reason he resolv'd to build a tower with the timber of the ship that was wrecked, whereof he lost no part, but made use of it all. To forward his design, the next day being *Thursday*, the 27th of *December*, news was brought, that the caraval *Pinta*, was in a river towards the east point of the island. To be assured of it, the *Cacique*, whose name was *Guacanagari*, sent a canoe with some *Indians*, who carried a christian thither: he having gone 20 leagues along the coast, returned without any news of it, which was the reason that no credit was given to another *Indian*, who said he had seen her some days before. Nevertheless the admiral did not alter his resolution of leaving some christians in that place, who were all still more sensible of the goodness and wealth of the country, the *Indians* bringing masks and other things of gold to give them, and telling them of several provinces in the island where it was

found. The admiral now being ready to depart, and discoursing with the king concerning the *Caribbes*, or *Canibals*, of whom they complained and were in great dread, therefore to please him with leaving some christians there, and at the same time make him afraid of our arms, he caus'd a gun to be fired against the side of the ship, which shot quite thro' it, and the bullet fell into the water, which not a little terrified the *Cacique*. Besides, he showed him all our other weapons, and how they offend'd with them, and defended themselves, telling him, that since such weapons were left to defend him, he need'd not to fear the *Caribbes*, for the christians would destroy them all, and he would leave them for his guard, and return himself to *Castile* for jewels and other things to give him. Then he particularly recommended to him *James de Arana*, son to *Roderick de Arana of Cordova*, of whom mention has been made above. To him, and *Peter Gutierrez* and *Roderick de Eskovedo*, he left the government of the fort, and command of 36 men, with abundance of commodities, provision, arms and cannon, and the boat that belonged to the ship, with carpenters, caulkers, and all other necessaries for settling there, also a surgeon, gunner, and such like persons. This done he prepar'd with all possible speed to return directly to *Castile*, without making any more discoveries, fearing, since he had but one ship left, left some other misfortune might befall him, which might hinder their catholic majesties from coming to the knowledge of those kingdoms he had newly acquired for them.

C H A P. XXXV.

*How the admiral set out to return to Spain, and found the other caraval commanded by Pinzon.*

ON *Friday* the 4th of *January*, at sun-rising, the admiral set sail, with the boats a-head, standing north-west, to get out of shoal water, that was about the port where he left the christians, by him called the port of the *Nativity*, because on *Christmas* day he had land'd, escaping the danger of the sea, and begun to build that colony. Those flats reach from cape *Santo* to cape *Serpe*, which is six leagues, and run out above three leagues to sea, and all the coast north-west and south-east is an open strand, and plain for four leagues up the country, where there are then high mountains, and abundance of large villages, in comparison of what is in the other islands. Then he sail'd towards a high

mountain, which he call'd *Monte Christo*, and lies 18 leagues E. of cape *Santo*. So that whosoever would come to the city of the *Nativity*, when he discovers *Monte Christo*, which is round like a pavillion, and looks almost like a rock, must keep out at sea two leagues from it, and sail west till he comes to cape *Santo*, when the city of the *Nativity* will be five leagues from him; and he must pass thro' certain channels among the flats, which lie before it. The admiral thought fit to mention these marks, that it might be known where the first habitation of christians was in those western parts. Having sail'd east of *Monte Christo* with contrary winds, on *Sunday* the 6th of *January*, in the morning, a sailer from the round

Where the first christian colony was.

The admiral builds a fort and leaves men in the island.

The other  
caravel found

round top discovered the caravel *Pinta* that was sailing westward, right before the wind. As soon as it came up with the admiral, *Martin Alonzo Pinzon*, the captain, coming aboard the admiral's caravel, began to show some reasons, and give excuses for his leaving of him, saying it had happened against his will. The admiral, tho' he very well knew the contrary, and was satisfied of the man's evil inclination, remembering his bold manner of proceeding before in the voyage, yet connived at him, and bore with all, for fear of ruining his undertaking, which might easily have been done, because most of his crew were *Martin Alonzo's* countrymen, and several of them his relations. And the truth is, that when he forsook the admiral, which was at *Cuba*, he went away with a design to fail to the island *Bobio*, because the *Indians* aboard his caravel hold him, there was abundance of gold there. When he was there and found nothing of what had been told him, he

was returning towards *Hispaniola*, where other *Indians* had told him there was much gold, and thus he had spent 20 days in sailing not above 15 leagues east of the *Nativity*, to a river which the admiral called of *Grace*, and there *Martin Alonzo* had lain 16 days, and had got gold enough, as the admiral had done at the *Nativity*, giving things of small value for it. Of this gold he distributed one half among his crew, to gain and please them, that he as captain might keep the rest, and afterwards he would persuade the admiral that he knew nothing of all this. He now following on his way to come to an anchor at *Monte Christo*, the weather not permitting him to proceed farther, he went in his boat up a river, southwest of the mount, where in the sand he discovered signs of gold dust, and therefore called it the *River of Gold*. This river lies 17 leagues east of the *Nativity*, and is not much less than the river *Guadalquivar* that runs by *Cordova*.

## C H A P. XXXVI.

*Of the first skirmish between the Christians and Indians, which happened about the gulf of Samana in Hispaniola.*

Fierce In-  
dians.

ON Sunday the 13th of January, being near the cape called *Enamorado*, or the *lovers Cape*, the admiral sent the boat ashore, where our men found some *Indians* with fierce countenances on the shoar, with bows and arrows, who seemed to be ready to engage, but at the same time were in a consternation. However, having some conference with them, they bought two of their bows and some arrows, and with much difficulty prevailed to have one of them go aboard the admiral. Their speech was suitable to their fierceness, which appeared greater than any people they had yet met with had shown; for their faces were all daubed over with charcoal, it being the custom of all those people to paint themselves, some black, some red and some white, some one way, and some another; their hair was very long, and hung in a bag made of parrots feathers. One of them standing before the admiral, as naked as he was born, as all the others there till then discovered were, he said in a lofty tone, they all went so in those parts. The admiral thinking this was one of the *Caribbes*, and that the bay parted them from *Hispaniola*, he ask'd of him where the *Caribbes* dwelt who pointed with his finger, in another island eastward, and that there were pieces of *Guanin*, as big as half the stern of the caravel; and that the island *Matimino* was all inhabited by women, with whom the *Ca-*

*ribbes* went and lay at a certain time of the year, and if afterwards they brought forth sons, they gave them to the fathers to carry away. Having answered to all the questions put to them, partly by signs, and partly by that little the *Indians* of *St. Salvador* could understand of their language, the admiral gave them to eat, and some bangles, as glass beads, and green and red cloath, which done, he sent them ashore, that they should cause gold to be brought if the others had any. The boat being ashore, they found on the shore among the trees 55 of them, all naked, with long hair, as the women in *Spain* wear it, and behind on the crown of the head, they had plumes of parrots or other birds feathers, and all of them armed with bows and arrows. When our men landed, the *Indian* that had been aboard made the others lay down their bows and arrows, and a great cudgel they carry instead of a sword, for, as has been said, they have no iron at all: when they came to the boat, the christians stepped ashore, and having begun to trade for bows and arrows by order of the admiral, the *Indians* who had already sold two, not only refused to sell any more, but with scorn, made as if they would seize the christians, and run to their bows and arrows where they had left them, taking up with them ropes to bind our men; they being upon their guard seeing them

A fray  
with the  
Indians.

*Lispaniola*, where there was much spent 20 days in the east of the *Nativity* admiral called *Alonso* had lain enough, as the *Nativity*, giving it. Of this gold long his crew, to that he as captain and afterwards he said that he knew now following on anchor at *Monte* permitting him in his boat up the mount, where signs of gold dust, the *River of Gold*, east of the *Nativity* less than the rises by *Cordova*.

them come in that fury, tho' they were but seven, fell courageously upon them, and cut one with a sword on the buttock, and shot another with an arrow in the breast. The *Indians* astonished at the resolution of our men, and the wounds our weapons made, fled most of them leaving their bows and arrows; and many of them had been killed, had not the pilot of the caraval, who commanded the boat, protected them. The admiral was not at all displeased at this skirmish, imagining these were the *Caribes* all the other *Indians* so much dreaded, or that at least they bordered on them, they being a bold and resolute people, as appeared by their aspect, arms and actions, and he hoped that the islanders hearing how seven christians had behaved themselves against 55 fierce *Indians* of that country, they would the more respect and honour our men that were left behind at the *Nativity*, and would not dare to offend them. Afterwards, about evening, they made a smook at land to show their courage; wherefore the boat went again to see what

they would have, but they could never be brought to venture themselves, and so the boat returned. The bows were of yew, almost as big as those in *France* and *England*, the arrows of small twigs growing out of the ends of the canes, which are massive and very strait, about the length of a man's arm and a half; the head is made of a small stick hardened at the fire, about a quarter of a yard and half long, at the end whereof they fix a fish's tooth, or bone, and poison it. For this reason the admiral gave that gulph the name of *Gulph de Flechas*, that is, *Gulph of arrows*, whereas the *Indians* called it *Samana*. There appeared a great deal of fine cotton and *Axi*, which is the pepper they use, and is very hot, some of it long and some round. Near land, where there was little water, grew abundance of those weeds our men saw in long strings upon the ocean, whence they concluded it all grew near land, and when ripe, broke loose, and was carried out to sea by the current.

C H A P. XXXVII.  
*How the admiral set out for Spain, and the caraval Pinta was parted from him in a great storm.*

ON Wednesday, the 16th of January, 1493. the admiral set forward with a fair wind from the aforesaid *Gulf of arrows*, now called *Samana*, towards *Spain*, because now both the caravals were very leaky, and they took much pains to keep them up: Cape *Santelmo* being the last land they saw; 20 leagues north-east of it, there appeared abundance of weeds, and 20 leagues still farther, they found all the sea covered with small tunny-fishes, whereof they saw great numbers the two following days, which were the 19th and the 20 of January, and after them abundance of sea-fowls, and all the way the weeds ran with the current in long ropes, lying east and west; for they had really found, that the current takes these weeds a great way off, and that they keep not on long in the same way; for sometimes they go one way, and sometimes another; and this they saw almost every day, till they were almost half seas over. Holding on their course with a fair wind, they made so much way, that in the opinion of the pilots, on the 9th of February, they were south of the islands *Azores*; but the admiral said they were 150 leagues short, and this was the truth, for they still found abundance of weeds, which as they went towards the *Indies*, they did not see till they were 263 leagues west of

Vol. II.

the island of *Ferro*. As they sailed on thus with fair weather, the wind began to rise more and more every day, and the sea to run so high, that they could scarce lie upon it. For which reason, on Thursday the 14th of February, they drove which way soever the wind would carry them; and the caraval *Pinta*, commanded by *Pinzon*, not being able to lie athwart the sea, run away due north, before the south wind, the admiral steering north-east to draw nearer to *Spain*, which the caraval *Pinta*, could not do, by reason of the darkness, tho' the admiral had always his light out. Thus when day appeared, they had quite lost sight of one another, each looking upon it as most certain, that the other was lost; therefore betaking themselves to prayers and religious acts; those aboard the admiral cast lots, which of them should go in pilgrimage for the whole crew to our lady of *Guadalupe*, which fell to the admiral. Afterwards they drew for another to go to *Loretto*, and the lot fell upon one *Peter de Villa*, a seaman of *Port St. Mary*. Then they cast lots for a third, who was to watch a night at *St. Olive of Moguer*, and the storm still increasing, they all made a vow to go barefoot and in their shirts at the first land they came to, to some church of our lady. Besides these general vows

*A terrible  
storm.*

6 Y

several

several others were made by private men, because the tempest was now vehement, and the admiral's vessel could scarce withstand it for want of ballast, which was fallen short, the provisions being spent. To supply which want, they thought convenient to fill all the vessels in the ship with seawater, which was some help, and made the ship bear more upright, and be in less danger of oversetting. Of this violent storm, the admiral has these words. I had been less concerned for the tempest, had I alone been in danger; for I know I owe my life to the supreme creator, and because I have been other times so near death, that only the least part was wanting to compleat it. But what infinitely grieved and troubled me was the consideration, that as it had pleased our lord to give me faith and assurance to go upon this undertaking, wherein I had now been successful; so now that those who opposed it were to be convinced, and your highnesses served by me with honour and increase of your mighty state, his divine majesty should please to obstruct all this by my death, which had yet been more tolerable, had it not been attended with the loss of all those men I had carried with me, upon promise of happy success. They seeing themselves in that affliction did not only curse their setting out, but the fear and awe my persuasions infused into them, to dissuade their return when outward bound, as they had several times resolved to do. But above all my sorrow was double, when I remembered two sons I had left at school at *Cordova*, destitute of friends, in a strange country, before I had done, or at least could be known to have done any service, which might be believed to incline your highnesses to remember them. And tho' on the one side I comforted myself with the faith, that our lord would not

permit a thing which was so much for the exaltation of his church, to be left imperfect, when I had with so much opposition and trouble, almost brought it to perfection: yet on the other side I considered, It was his will, that because of my demerits he would not permit me to obtain such honour in this world, but snatched it from me. Being in this inward confusion, I remembered your highnesses good fortune, which tho' I were dead, and the ship lost, might find some means that a conquest so near achieved should not be lost, and that it was possible the success of my voyage should by some means or other, come to your knowledge. For this reason as briefly as the time would permit, I writ upon parchment, that I had discovered those lands, I had promised, as also in how many days, and what way I had done it, the goodness of those lands, the nature of the inhabitants, and how your highnesses subjects were left in possession of all I had discovered; which writing folded and sealed, I supercribed to your highnesses, promising in writing upon it a 1000 ducats to him, that should deliver it sealed to you; to the end, that if any foreigners found it, the promised reward might prevail with them, not to give that intelligence to another. Then I caused a great cask to be brought to me, and having wrapped the writing in an oyled cloath and then put it into the cask of wax, I dropped it into the cask, and having stopped the bung close, cast it into the sea, all the men fancying it was some act of devotion. And apprehending that might perhaps never be taken up, and the ship still failed nearer to *Spain*, I made another packet like the first, and placed it at the top of the poop, to the end that when the ship sunk, the cask might take its chance, remaining still above water.

## C H A P. XXXVIII.

*How the admiral arrived at the islands Azores and the people of the island of St. Mary took away his boat and the men in it.*

*They spy land.*

Sailing on in such mighty danger, and so great a storm, on *Friday* the 15 of *February*, at break of day, one *Ruy Garcia*, from the round top, saw land bear E.N.E. from them. The pilot and seamen judged it was the rock of *Lisbon*, but the admiral concluded it was one of the islands *Azores*, and tho' they were at no great distance from it, yet they could not come to an anchor that day because of the weather. Thus plying about because the wind was east, they lost sight of the island and discovered another, about which they ran struggling against wind and wea-

ther, with continual labour and no respite, not being able to get to land. Wherefore the admiral in his journal says, on *Saturday* the 16th of *February*, I arrived at one of those islands at night, and by reason of the bad weather, could not tell which of them it was. That night I took a little rest, because from *Wednesday* till then, I had never slept, and was lame of both my legs, having been continually in the open air and wet, nor was it little that I suffered by provisions. Upon *Monday* morning, being at an anchor, I understood from some of the inhabitants, that it was the island of *St. Mary*, one

one of the *Azores*, and all of them admired I had escap'd, considering the terrible storm, which had held for 15 days without intermission in those parts. These people understanding what the admiral had discovered, seem'd to rejoice, giving praise to God, and three of them came aboard with some fresh provisions and many complements from the commander of the island, who was far from thence at the town; for about this place, there was nothing to be seen but a hermitage, which as they said, was dedicated to the blessed virgin. Thereupon the admiral and all his crew remembering they had made a vow the *Thursday* before, to go barefoot and in their shirts, the first land they came at, to some church of our lady; they were all of opinion they ought here to perform it, especially it being a place where the people and governour

express'd so much affection and tendernefs for our men, and belonging to a king, who was so great a friend to him of *Casile*. Therefore the admiral desired those three men to repair to the town, and cause the chaplain to come that had the keys of that hermitage, that he might say mass there. These men consenting, they went into the caraval's boat, with half the ship's crew, that they might begin to perform their vow, and being come back, the rest might go to do their part. Being landed barefooted and in their shirts, as they had vow'd to do, the governour, with abundance of people from the town, who lay in ambush, on a sudden rush'd out upon them and made them prisoners, taking their boat, without which he thought the admiral could never get away from him.

CHAP. XXXIX.

*How the admiral weathered another storm, and at last recovered his boat and men.*

THE admiral thinking they stay'd too long, who were gone ashoar in the boat; it being then noon, whereas they went off by break of day, he suspected some misfortune had befallen them, either at land or at sea. Therefore not being able from the place where he lay, to discover the hermitage they were gone to, he resolv'd with his ship to sail about a point, whence the church could be seen. Being come near, he saw abundance of people a horseback, who dismounting, went into the boat to attack the caraval. The admiral therefore mistrusting what might happen, ordered his men to be in a readiness and arm'd, but make no shew of resistance, that the *Portuguese* might come the nearer. When they were near the admiral, the captain of them stood up, demanding to parley, which the admiral granted, thinking he would come aboard, and might be secur'd without breach of faith, since he had seiz'd his men without provocation. But the *Portuguese* durst not come nearer than to be heard, when the admiral told him, he admir'd at his irregular manner of proceeding, and that none of his men came in the boat since they were gone ashoar upon a safe conduct, and offers of relief, especially since the governour himself had sent to welcome him. He therefore desired him to consider, that besides his doing an action which enemies would not be guilty of, and against the laws of honour, the king of *Portugal* would be highly offended at it, whose subjects were, when they landed, in the dominions of their catholic majesties, or resided there,

made much of, and treated with all manner of civility, and were safe without any safe conduct, as if they were in *Lisbon*; besides that their highnesses had given him letters of recommendations to all princes, potentates, and other persons in the world, which he would shew him if he drew near. Therefore since such letters were received with respect in all parts, and he and the king's subjects well treated on their account, much more they ought to be so in *Portugal*, their princes being so near neighbours and allies; especially he being their great admiral of the ocean and vice roy of the *Indies* he had discovered, all which he was ready to shew him under their highnesses hands and seals. Accordingly at that distance he shew'd his commissions, and told him he might draw near without any apprehension, for as much as in regard to the peace and amity betwixt their catholic majesties and the king of *Portugal*, they had commanded him to pay the utmost civility to such *Portuguese* ships as he met; adding, that though he should obstinately persist in keeping his men, yet that would not prevent his returning to *Spain*, he having still men enough to sail to *Sevil*, and to do him harm, if need were, whereof he himself would be the occasion, and such punishment would be adjudged well deserved of him, besides that his king would punish him, as giving cause for a war between him and their catholic majesties. The captain and his men answered, that they neither knew their catholic majesties, nor their letters, nor did they fear them, and would make him know what

the island of St.

and no respite, and. Wherefore says, on *Saturday* arrived at one of by reason of the which of them a little rest, been, I had never my legs, have open air and suffered by pro-ning, being at some of the and of St. *Mary*, one

what *Portugal* was. By this answer the admiral suspected, there had some breach happened between the two crowns since his departure and therefore gave him such an answer as his folly deserv'd. At last when they were parting, the captain stood up, and at a great distance said, he might go to the harbour with his caraval, for that all he did was by order of the king his master. The admiral hearing it, call'd all that were aboard to bear witness, and calling to the captain and *Portuguese*, swore he would never go off the caraval, till he had taken an *100 Portuguese* to carry them into *Castile*, and to destroy all that island. This said, he again came to an anchor in the port, where he was at first, the weather obliging him to it. But the next day the wind still increasing, and the place where he lay being unsafe, he lost his anchors, and was forced to stand out to sea, towards the island of *St. Michael*, where in case he could not come to an anchor, he had resolv'd to run it out at sea, not without much danger, as well because the sea ran high, as by reason he had but three able seamen left, and some grumets, all the rest being land men, and *Indians* who understood nothing of sea affairs. But supplying the want of the absent in his own person, he pass'd that night with much labour and danger, till day appearing, perceiving he had lost sight of

the island of *St. Michael*, and that the weather was calmer, he resolv'd to return to the island of *St. Mary*, to endeavour to recover his men, anchors, and boat. He came up with it on *Thursday* the 21st of *January*, after noon, and soon after the boat came off with five men and a notary, who all upon security given them, went aboard and lay there that night, it being late. The next day they said they came from the captain to know for certain whence the ship came, and whether it had the king of *Spain's* commission, which being made out, they were ready to show them all manner of friendship, which they did because they could not seize the ship nor the admiral, and that they might suffer for what they had done. The admiral suppressing his resentment, said, he thank'd them for their civil offers, and since they proceeded according to the maritime laws and customs, he was ready to satisfy them; and accordingly show'd them the king of *Spain's* general letter of recommendation, directed to all his subjects and those of other princes, as also his commission for that voyage; which the *Portuguese* having seen, they went ashore satisfied, and soon dismissed the seamen, with their boat, of whom they understood it was *reported* in the island, that the king had sent orders to all his subjects to secure the person of the admiral by any means whatsoever.

## CHAP. XL.

*How the admiral sail'd from the islands of Azores, and was forced into Lisbon by a storm.*

Another  
terrible  
storm.

ON *Sunday* the 24th of *February*, the admiral sail'd from the island of *St. Mary* for *Spain*, being in great want of wood and ballast, which he could not take in, because of the bad weather, tho' the wind was fair for his voyage. Being an *100 leagues* from the nearest land, a swallow came into the ship, which, as was believ'd, the storm had drove out to sea, which appeared more plainly, because the next day being the 28th of *February*, a great many more swallows and land fowl came aboard, and they saw a whale. On the 3d of *March* the tempest was so great, that after midnight it split their sails; wherefore being in great danger of their lives, they made a vow to send one in pilgrimage to our lady *de Cinta* at *Guelva*, whither he was to go barefoot, and in his shirt. The lot fell again upon the admiral, God showing thereby, that his offerings were more acceptable than those of others; besides which, other private vows were made. Thus running on without a rag of cloath, but bare masts, a mighty sea,

high winds and frightful thunder, each of which seem'd enough to destroy the caraval, it pleas'd God to give them sight of land, about midnight, which offered no less danger than the rest; for to avoid being beaten to pieces, and running into some place where they knew not how to get off, they were forced to make some sail, to bear up against the storm till day, which appearing, they found they were upon the rock of *Lisbon*. The admiral was forced to put in there, to the great astonishment of the people of that country, and their seamen, who ran from all parts to behold, as it were some wonder, a ship that had escap'd so terrible a storm; having receiv'd news of many ships that had perish'd about *Flanders*, and in other countries of late days. He came to an anchor in the river c<sup>t</sup> *Lisbon* upon *Monday* the 4th of *March*, and presently sent away an express to their catholic majesties with the news of his arrival, and another to the king of *Portugal*, asking leave to go up to anchor before the city, the place

The admiral at Lisbon.

CHAP. XLI.

*How the people of Lisbon came to see the admiral, as a prodigy; and he went to  
visit the king of Portugal.*

*The admi-  
ral's return  
to Lisbon  
was a great  
event.*

ON Tuesday the 5th of March, the mas-  
ter of a great guard ship that lay  
in the harbour, came with his boat full of  
arm'd men to the admiral's caraval, requir-  
ing him to come along to give an account  
of himself to the king's officers, as was  
practis'd by all ships that came into the  
harbour. He answered, That the king of  
Spain's admirals, as he was, were not obli-  
g'd to obey any such fummons, nor to  
quit their ships, to give any account of  
themselves, and he was resolv'd to do his  
duty. The master bid him at least to send  
his boatwain. The admiral reply'd, It  
was still the same thing, whether he sent a  
grummet, or went himself, and therefore it  
was in vain to desire him to send any body.  
The master being sensible he was in the  
right, desired him at least to show him the  
king of Spain's letter, that he might satisfy  
his captain: This being but reasonable, the  
admiral shew'd him their catholick ma-  
jesties letter, with which he was satisfied,  
and went back to his ship to give an ac-  
count of what had happened, to Alvaro de  
Acunna his captain, who came immediat-  
ly with trumpets, fifes, drums, and great  
state, aboard the admiral, expressing much  
kindness, and offering his service. The  
next day it being known at Lisbon, that the  
ship came from the Indies, such throngs of  
people went aboard to see the Indians, and  
hear news, that the caraval could not con-  
tain them, and the water was covered with  
boats, some of them praising God for so  
great a happiness, and others storming that  
they had lost that discovery, thro' their  
king's incredulity; so that day was spent  
with great concourse of people. The next  
day, the king ordered his officers to pre-  
sent the admiral with all sorts of refresh-  
ment, and all things he stood in need of ei-  
ther for himself, or his men, without asking  
any pay. At the same time he writ to the  
admiral, congratulating his happy arri-  
val, and desiring, since he was in his do-  
minions, he would come to see him. The  
admiral was doubtful what to do in this  
case, but he considered the king was in a

mity with their catholick majesties, and had  
treated him courteously; and besides, to  
take off all suspicion that he came from his  
conquests, he consented to go to Valparaiso,  
nine leagues from Lisbon, where the king  
was, whither he came on Saturday night,  
being the 9th of March. The king order-  
ed all the nobility of his court to go out  
to meet him, and being come into his pre-  
sence, did him great honour, commanding  
him to put on his cap, and sit down, and  
having with a cheerful countenance heard  
the particulars of his prosperous voyage,  
offer'd him all he stood in need of, for the  
service of their catholick majesties, though  
he thought, that so far as he had  
been a captain in Portugal, that conquest  
belong'd to him. To which the admiral  
answer'd, That he knew of no such a-  
greement, and that he had strictly observ'd  
his orders, which were not to go to the  
mines of Portugal, nor to Guinea. The king  
said, all was well, and he doubted not but  
justice would be done. Having spent a long  
time in this sort of discourse, the king com-  
manded the prior of Crato, the greatest man  
then about him, to entertain the admiral,  
and shew him all civility and respect, which  
was done accordingly. Having stay'd there  
all Sunday and all Monday, till after mass,  
the admiral took leave of the king, who  
express'd great kindness, and made him  
great proffers, ordering D. Martin de No-  
ronha to go along with him, and many o-  
ther gentlemen went for company to ho-  
nour him, and hear an account of his voy-  
age. As he was thus on his way to Lisbon,  
he pass'd by a monastery, where the queen  
then was, who sent earnestly to intreat him  
he would not pass by without seeing her.  
She was much pleas'd to see him, and did  
him all the favour and honour that was  
due to the greatest lord. That night a  
gentleman came from the king, to the ad-  
miral, to let him know, that if he pleas'd  
to go by land into Spain, he would attend  
him, provide lodgings all the way, and fur-  
nish him all necessaries, as far as the borders  
of Portugal.

*Nobly re-  
ceiv'd by  
the king.*

## C H A P. XLII.

*How the admiral left Lisbon to return to Castile by sea.*

*The admiral returns to Palos.*

ON Wednesday the 13th of March, two hours after day, the admiral set sail for Sevil, and on Friday following at noon, arrived at Saltes, and came to an anchor in the port of Palos, whence he had set out on the 3d of August the foregoing year 1492, 7 months and 11 days before his return. He was there received by all the people in procession, giving thanks to God for his prosperous success, which, it was hop'd, would redound so much to the propagation of christianity, and increase of their catholic majesties dominions; all the inhabitants of that place looking upon it as a great matter that the admiral set out from thence, and that most of the men he had with him, belong'd to it, tho' many of them, thro' Pinzon's fault, had been mutinous and disobedient. It happened that when the admiral came to Palos, Pinzon was arriv'd in Galicia, and design'd to go by himself to Barcelona to carry the news to their catholic majesties, who sent him orders not to go thither without the admiral, with whom he had been sent to discover, at which he was so concern'd and offended, that he return'd indispos'd, to his native country, where within a few days he died for grief: But before he got to Palos, the admiral set out for Sevil, designing thence for Barcelona, where their catholic majesties were; and he was

forced to stay a little by the way, tho' but never so little, to the so great admiration of the people wheresoever he went, that they ran from all the neighbouring towns, down to the roads to see him, the Indians, and other things he brought. Thus holding on his way he got to Barcelona about the middle of April, having before sent their highnesses an account of the happy success of his voyage, which was extraordinary pleasing to them, and they ordered him a most solemn reception, as to a man that had done them such singular service. All the court and city went out to meet him; and their catholic majesties sat in publick with great state, on rich chairs under a canopy of cloth of gold; and when he went to kiss their hands, they stood up to him as to a great lord, made a difficulty to give him their hands, and caused him to sit down. Having given a brief account of his voyage, they gave him leave to retire to his apartment, whither he was attended by all the court; and he was so highly honoured and favoured by their highnesses, that when the king rode about Barcelona, the admiral was on one side of him, and the Infante Fortuna on the other; whereas before, none went by his majesty but the said Infante, who was his near kinsman.

*His reception at Barcelona.*

## C H A P. XLII.

*How it was resolved that the admiral should return with a powerful fleet to people the island Hispaniola, and his holinesses approbation of the conquest was obtain'd.*

*The pope's grant.*

ORDERS were given at Barcelona, with great care and expedition for the admiral's return to Hispaniola, as well to relieve those that were left there, as to enlarge the colony and subdue the island, with the rest that were and should be discovered. To make their title to them the stronger, their catholic majesties, by the advice of the admiral, procured the pope's approbation and consent for the conquest of the said Indies, which pope Alexander the 6th, who then governed the church, readily granted; not only for what was already, but for all that should be discovered westward, till it should come to the east, where any christian prince was then actually in possession, forbidding all persons in general, to intrude within those bounds. The same his holiness con-

firmed the next year, in very significant terms. And their catholic majesties being sensible that the admiral had been the cause of all this favour granted by the pope, and that his discovery had entitled them to the possession of all those parts, they were pleas'd he should be immediately gratify'd at Barcelona, on the 28th of May, and therefore granted him a new privilege, or rather an exposition, and explanation of what he had before, confirming to him all they had granted before, and in plain terms declared how far the bounds of his admiralship, and vice-royship extended, being over all that which his holiness had granted them, thus ratifying what they had given him before, which privileges and prerogatives are as follows.

C H A P. XLIV.

*Privileges and prerogatives granted by their catholic majesties to the admiral.*

*The admiral's letter patent.* Ferdinand and Elizabeth, by the grace of God king and queen of Castile, of Leon, of Aragon, of Sicily, of Granada, of Toledo, of Valencia, of Galicia, of Majorca, of Minorca, of Sevil, of Sardinia, of Jaen, of Algarve, of Algezira, of Gibraltar, of the Canary Islands, count and countess of Barcelona, lord and lady of Biscay and Molina, duke and duchess of Athens and Neopatria, count and countess of Rouffillion and Cerdagne, marquess and marchioness of Oristan, and Gociano, &c. Forasmuch as you Christopher Columbus, are going by our command with some of our vessels and men to discover and subdue some islands and continent in the ocean, and it is hoped that by God's assistance, some of the said islands and continent in the ocean will be discovered and conquer'd by your means and conduct, therefore it is but just and reasonable, that since you expose your self to such danger to serve us, you should be rewarded for it. And we being willing to honour and favour you for the reasons aforesaid: Our will is, That you, Christopher Columbus, after discovering and conquering the said islands and continent in the said ocean, or any of them, shall be our admiral of the said islands and continent you shall so discover and conquer; and that you be our admiral, vice-roy and governor in them, and that for the future you may call and style your self, D. Christopher Columbus, and that your sons and successors in the said employment may call themselves dons, admirals, vice-roys and governors of them; and that you may exercise the office of admiral, with the charge of vice-roy and governor of the said islands and continent, which you and your lieutenants shall conquer, and freely decide all causes civil and criminal, appertaining to the said employment of admiral, vice-roy and governor, as you shall think fit in justice, and as the admirals of our kingdoms use to do; and that you have power to punish offenders; and you and your lieutenants exercise the employments of admiral, vice-roy and governor in all things belonging to the said offices, or any of them; and that you enjoy the perquisites and salaries belonging to the said employments, and to each of them, in the same manner as the high-admiral of our kingdoms does. And by this our letter, or a copy of it sign'd by a public notary: We command prince John, our most dearly beloved son, infantes, dukes, prelates, marquesses, great masters and military orders, priors, commendaries, our counsellors, judges, and other officers of justice whatsoever, belonging to our household, courts and chancery,

and constables of castles, strong-houses and others; and all corporations, bailiffs, governors, judges, commanders, sea-officers; and the aldermen, common-council, officers and good people of all cities, lands and places in our kingdoms and dominions, and in those you shall conquer and subdue, and the captains, masters, mates and other officers and sailors, our natural subjects now being, or that shall be for the time to come, and any of them, that when you shall have discovered the said islands and continent in the ocean; and you, or any that shall have your commission, shall have taken the usual oath in such cases, that they, for the future, look upon you as long as you live, and after you, your son and heir, and so from one heir to another for ever, as our admiral on our said ocean, and as vice-roy and governor of the said islands and continent, by you Christopher Columbus discovered and conquered; and that they treat you and your lieutenants, by you appointed, for executing the employments of admiral, vice-roy and governor, as such in all respects, and give you all the perquisites and other things belonging to such appertaining to the said offices; and allow, and cause to be allow'd you, all the honours, graces, concessions, prebeminences, prerogatives, immunities and other things, or any of them which are due to you, by virtue of your commands, of admiral, vice-roy and governor, and to be observed completely, so that nothing be diminished, and that they make no objection to this, or any part of it, nor suffer it to be made; forasmuch as we from this time forward, by this our letter, bestow on you the employments of admiral, vice-roy and perpetual governor for ever; and we put you into possession of the said offices, and of every of them, and full power to use and exercise them, and to receive the perquisites and salaries belonging to them, or any of them, as was said above. Concerning all which things, if it be requisite, and you shall desire it, we command our chancellor, notaries and other officers to pass, seal and deliver to you our letter of privilege, in such firm and legal manner, as you shall require or stand in need of. And that none of them presume to do any thing to the contrary, upon pain of our displeasure, and forfeiture of thirty ducats for each offence. And we command him, who shall show them this our letter, that he summon them to appear before us at our court, where we shall then be, within 15 days after such summons, under the said penalty. Under which same we also command any public notary whatsoever, that he give to him that shows it,

him, a certificate under his seal, that we may know how our command is obey'd.

Given at *Granada*, on the 30th of *April*, in the year of our Lord 1492. I the king, I the queen.

By their majesties command, *John Coloma* secretary to the king and queen. Entered according to order, *Roderick Doñor. Registred, Sebastian Dolana, Francis de Madrid*, chancellors.

**A**ND now sofarasmuch as it has pleased our lord, that you have discovered several of the said islands, as we still hope you will by his grace discover and find others and the continent in the said ocean, and those parts of the Indies, and have desired and requested of us, that we would confirm to you our said grant here set down, and all the contents of it, to the end that you and your children, heirs and successors, one after another, and after your days, may have and enjoy the said employments of admiral, vice-roy and governor of the said ocean, islands and continent, as well of those you have already found and discover'd, as of those you shall for the future find and discover, with all the power, prebeminence and prerogative, as the admirals, vice-roys and governors in our kingdoms of Castile and Leon do enjoy; and that all the perquisites and salaries appertaining and belonging to the said offices, and granted and allowed to our admirals, vice-roys and governors may be made good to you; or that we make such provision in this case, as in our goodness we shall think fit. And we having regard to the hazard and danger you have expos'd your self to in our service, in going to discover and find out the said islands, and that which you now run in attempting to find out the other islands and continent, wherein we have been, and hope to be by you well served: To requite and reward you do by these presents, confirm to you and your children, heirs and successors, one after another, now and for ever the said employments of admiral of the said ocean, and vice-roy and governor of the said islands and continent by you discovered and found out; and of the other islands and continent, that shall be by you or your industry found or discovered for the future in those parts of the Indies. And it is our will, that you, and after you your children, heirs and successors, one after another, enjoy the said employment of our admiral of the said ocean, which is ours, and commences at a line, we have caused to be drawn from the islands Azores, to those of Cabo Verde, and so from pole to pole north and south; so that all beyond the said line westward is ours, and belongs to us. And accordingly we constitute you admiral, and your sons and successors, one after another, of all that part for ever. And we also appoint you our vice-roy and governor,

The confirmation.

and after you, your sons heirs and successors, one after another, of the said islands and continent discovered, and to be discovered in the said ocean in those parts of the Indies, as has been said; and we grant you the possession of all the said employments of admiral, vice-roy and governor for ever, with full commission and authority to use and exercise in the said sea, the office of admiral in all those things, and in the same manner and form, and with the rights and privileges, perquisites and salaries, as our admirals of Castile and Leon, have and do use, have enjoy'd or enjoy, as well in the said islands and continent already discover'd, as in those that shall hereafter be discovered in the said ocean and said parts of the Indies, that the planters of them all may be the better governed. And we grant you such power and authority, that you may, as our vice-roy and governor, and your lieutenants, judges, commanders and officers by you created, exercise the civil and criminal jurisdiction, the supreme and mean authority, and the absolute and mixt command. And in those places you may remove, turn out, and put in others in those places, as often as you please, and shall think convenient for our service. And that they have power to hear, judge and determine all suits or causes civil or criminal, that shall occur or arise in the said islands or continent; and that they have and receive the fees and salaries usually annex'd, and appertaining to those employments in our kingdoms of Castile and Leon. And you our said vice-roy and governor may hear and determine all the said causes and any of them, whensoever you shall please, upon the first motion by way of appeal or complaint, and examine, determine and decide them, as our vice-roy and governor; and you and your children may do all that is reasonable in such cases, and all other things appertaining to the office of vice-roy and governor, and that you and your lieutenants and officers appointed to this purpose, may take such cognizance, and use such methods as you shall think proper for our service, and the execution of our justice. All which you and they may do and perform lawfully and effectually, as they might and ought to do, had the said officers been appointed by us. But our will and pleasure is, that such letters patents as you shall grant, be drawn and granted in our name, with these words, *Ferdinand and Elizabeth* by the grace of God king and queen of Castile and Leon, &c. and be sealed with our seal, which we will cause to be given you for the said islands and continent. And we command all the people, inhabitants and other persons in the said island and continent, to obey you, as our vice-roy and governor of the same; and those that sail on the said seas to obey you as our admiral of the said ocean; and that all of them execute your letters and orders, and take part with

The admiral's second voyage.

you and your officers, for the execution of our justice; and give, and cause to be given you, all the aid and assistance you shall require and stand in need of, upon such penalties as you shall impose on them, which we by these presents do impose on them, and do look upon them as impos'd, and do grant you authority to execute them on their persons and goods. And it is also our will, that if you shall find it for our service, and the execution of justice, That any persons who shall be in the said islands or continent, depart from them, and do not return nor stay in them, and that they come and appear before us, you may in our name command, and make them depart the said islands. All whom by these presents we command, that they presently perform, execute and put in practice all that has been said, without looking farther, or asking advice upon it, nor expecting any other letter or command from us, notwithstanding any appeal or petition they shall make or present against your said order. For all which things, and any other due or belonging to the said offices of our admiral, viceroy, and governour, we give you sufficient authority, with all incidents, dependencies, and emergencies to them annexed or inherent. Concerning all which things, if it shall be your will, we do command our chancellor, notaries, and other officers belonging to our seals, that they

give, pass, dispatch, and seal you our letter of privilege, made as effective, firm and strong, as you shall require of them and stand in need of; and that none of them presume to do any thing to the contrary, upon pain of our displeasure, and of thirty ducats to be paid to our treasury by every one that shall be guilty of the contrary. And besides, we command him that shall shew them this our letter to summon them to appear before us at our court, wherefore we are, within fifteen days upon the said penalty. Under which we command any publick notary, that shall be called for such purpose, that he give to him that shall shew it him, a certificate sign'd under his hand, that we may know how our commands are obey'd.

Given in the city of Barcelona the 28th of May, in the year of our Lord 1493.

I the King, I the Queen.

By their majesties order, *Ferdinand Alvarez de Toledo*, secretary to the king and queen, our lord and lady.

*Peter Gutierrez*, chancellor, without fees for seal or entry.

Deliver'd, *Roderick Doctor*.

Enter'd, *Alonso Perez*.

# C H A P. XLV.

*How the admiral went from Barcelona to Seville, and set out thence for Hispaniola.*

The admiral's second voyage.

ALL things necessary for the peopling of those countries being provided, the admiral departed from Barcelona for Seville in June, and being come thither, so diligently solicited the fitting out of the fleet their catholic majesties had ordered him to provide, that in a short time seventeen ships, between great and small, were made ready, well stored with provisions, and with all things thought necessary for peopling of those countries; as handicrafts of all sorts, labourers, countrymen to till the land; besides, the fame of gold and other rarities in those countries, had drawn together so many gentlemen, and other persons of worth; that it was necessary to lessen the number, and not to allow so many to go aboard, at least till it appeared in some measure how things would succeed in those parts, and till things were a little settled. Yet was it impossible so much to confine the number of people that went aboard, but that it amounted to 1500 of all sorts; among whom

some carried horses, asses, and other beasts, which were afterwards of great use and advantage to the planters in those countries. Being thus furnished, the admiral weigh'd anchor in the road of Cadiz, where the fleet had been fitted, upon Wednesday the 25th of September 1493, an hour before sun-rising, my brother and I being there, and stood south-west for the Canary islands, designing there to take in some necessary refreshment. On the 28th of September, being 100 leagues from Spain, there came aboard the admiral's ship, abundance of land-fowl, turtle-doves, and other sorts of small birds, which seem'd to be passing over to winter in *Africk*, and to come from the islands *Azores*. He holding on his course, on Wednesday the 2d of October arrived at *Gran Canaria*, and came to an anchor; at midnight sail'd again for *Gomera*, where he arriv'd on the fifth of October, and orders were given for taking up with all speed whatsoever the fleet stood in need of.

He arrives at the Canaries.

## C H A P. XLVI.

*How the admiral departing from Gomera, crossed the ocean and discovered the Caribbee islands.*

ON Monday the 7th of October the admiral continued his voyage towards the Indies, having first deliver'd a commission shut up and seal'd, to every ship, commanding them not to open it, unless they were separated from him by stress of weather; for he in those letters giving an account of the course they were to steer, to come to the town of the Nativity in Hispaniola, would not have that course known to any wit. At great need. Thus sailing with a fair gale till Thursday the 24th of October, when being 400 leagues west of Gomera, he yet met with none of the weeds he had seen the first voyage, when he was out but 250 leagues, to the great astonishment of them all. That day and the next a swallow flew about the fleet. On Saturday at night the body of St. Elmo was seen, with seven lighted candles on the round-top, and there follow'd mighty rains, and frightful thunder. I mean, the lights were seen, which the seamen affirm to be the body of St. Elmo, and they sing litanies and prayers to him; looking upon it as most certain, that in those storms where he appears, there can be no danger. Whatsoever this is, I leave to them; for if we will believe Pliny, when such lights appeared in those times to the Roman sailors in a storm, they said they were Castor and Pollux, whereof Seneca makes mention also, at the beginning of his first book of nature. But to return to our history; on Saturday

the second of November, at night, the admiral perceiving a great alteration in the sky and winds, and taking notice of the mighty rains, he concluded for certain that he was near some land, and for this reason caused most of the sails to be furl'd, and ordered all to be upon the watch; nor without cause; for that same night, as day began to break, they spy'd land seven leagues to the westward, which was a high mountainous island; and he called it *Dominica*, because discovered upon Sunday morning. A while after he saw another island north-east of *Dominica*, and then another, and another after that, more northward. For which mercy God had been pleased to bestow on them, all the men assembling in the poop, sung the *Salve regina*, and other prayers and hymns very devoutly, giving thanks to God, for that in twenty days after departing from Gomera, they had made that land, judging the distance between them to be between 750 and 800 leagues. And finding no convenient place to come to an anchor on the east side of the island *Dominica*, they stood over to another island which the admiral called *Marigante*, that being his ship's name. Here landing, he with all necessary solemnity again confirmed the possession he had in his first voyage taken of all the islands and continent of the *West Indies* for their catholic majesties.

## C H A P. XLVII.

*How the admiral discovered the island of Guadalupe, and what he saw there.*

ON Monday the fourth of November, the admiral sailed from the island *Marigante* northwards, by another great island, which he called *St. Mary of Guadalupe*, for his own devotion, and at the request of the friars of the house of that name, to whom he had made a promise to call some island by the name of their monastery. Before he came to it, at two leagues distance, they discovered a very high rock, ending in a point, whence gush'd out a stream of water, as thick as a large barrel, which falling made such a noise, that it was heard aboard the ships, tho' many affirmed it was only a white vein in the rock, the water was so white and frothy by reason of its steep fall. Going ashore in the boat to view a fort of town they saw from the shore, they found

no body there, the people being fled to the woods, except some children, to whose arms they ty'd some baubles to allure their fathers when they returned. In the houses they found geese like ours, and abundance of parrots with red, green, blue, and white feathers, as big as common cocks. They also found pumpions, and a sort of fruit, which look'd like our green pine-apples, but much bigger, and within full of a solid meat, like a melon, and much sweeter both in taste and smell, which grow on long stalks like lillies or aloes, wild about the fields, and are better than those that are brought up by art, as afterwards appeared. They also saw other sorts of fruits and herbs differing from ours. Beds of cotton nets, that is, hammacks, bows, and arrows, and other

ther

ther such things, of which our men took none, that the *Indians* might be the less afraid of the christians. But what they most admired was, that they found an iron-pan, tho' I believe that the rocks and fire-stones in that country being of the colour of bright iron, a person of but indifferent judgment that found it, without looking farther, took it for iron, tho' in truth it was not so; forasmuch as from that day to this, there was never any thing of iron found among those people, nor did I hear the admiral speak of this. And therefore I am opinion, that he using daily to write down whatsoever happened, and was told him, that he might among other things set down what was told him concerning this particular, by those that were ashore. And tho' it were of iron, it was not to be admired, because the *Indians* of the island of *Guadalupe*, being *Caribbees*, and making their excursions to rob as far as *Hispaniola*, perhaps they had that pan of the christians, or of the other *Indians* of *Hispaniola*; and it is possible they might carry the body of the ship the admiral lost, to make use of the iron; and tho' it were not the hulk of that ship, it must be the remainder of some other wreck, carried thither by the wind and current from our parts. But be it what it will, they that day took neither the pan nor any thing else, but returned to their ships. The next day, which was *Tuesday* the fifth of *November*, the admiral again sent two boats ashore, to endeavour to take some body that might give him an account of the country, and inform him how far off, and which way *Hispaniola* lay. Each of the boats brought back a youth, who agreed in saying they were not of that island, but of another call'd *Borriquen* (now *St. John*) and that the inhabitants of that island of *Guadalupe* were *Caribbees* or *Canibals*, and had taken them prisoners from their own island. Soon after the boats returning to shore, to take up some christians they had left there, found six women with them, who had fled to them from the *Caribbees*, and came of their own accord aboard the ships. The admiral to allure the islanders, would not keep them aboard, but gave them some glass beads and bells, and made them be set ashore against their wills. This was not done unadvisedly, for as soon as they landed, the *Caribbees* in the sight of the christians, took away all the admiral had given them. Therefore either thro' the hatred they bore the *Caribbees*, or for the fear they had conceived of those people; awhile after, when the boats returned for wood and water, the said women got into them, begging of the seamen to carry them aboard the ships, and giving them to understand by signs, that those peo-

ple did eat men, and make slaves of them, and therefore they would not stay with them. So that the men yielding to their intreaties, carried them back to the ships, with two children and a young man that had made his escape from the *Caribbees*, thinking it safer to put themselves into the hands of people they never saw, and such strangers to their nation, than to remain among those they knew to be wicked and cruel, and who had eaten their husbands and children, and they say they do not kill and eat the women, but keep them as slaves. One of the women told them, that towards the south there were many islands, some inhabited, others not, which both she and the other women, severally call'd *Giamachi*, *Cairvaco*, *Huino*, *Buriari*, *Arubeira*, *Sixibei*. But the continent, which they said was very great, both they and the people of *Hispaniola*, called *Zuanta*, because in former times canoes had come from that land to barter with abundance of lads, of whom they said there were two thirds in an island not far distant; and they also said, that a king of that country whither they fled, was gone with ten great canoes, and 300 men, to make incursions into the neighbouring islands, and take people to eat. The same women gave information where the island *Hispaniola* lay; for tho' the admiral had inserted it in his sea-chart; yet for his farther information, he would hear what the people of that country said of it. He would immediately have failed that way, had he not been told, that one captain *Mark* was gone ashore with eight men, without his leave, before day, and was not yet returned. He was therefore forced to send out to look for him, tho' in vain; for by reason of the great thickness of the trees, there could be no discovering of them. Therefore the admiral, that they might not be lost, or be obliged to leave a ship behind to take them in, which might afterwards miss her way to *Hispaniola*, resolved to stay there till the next day; and because the country, as has been said, was full of great woods, he ordered them to be sought after again, and that they should carry trumpets and muskets to bring them to the noise. These people having strayed all that day, returned to their ships without finding or hearing any news of them. The admiral therefore seeing it was now *Thursday* morning, and no news had been heard of them since *Tuesday*, and that they went without leave, resolved to continue his voyage, or at least make shew of so doing, that it might be a punishment to others, but at the intreaty of some of their kindred and friends, he stay'd, and ordered the ships should in the mean while take in wood and water, and the men wash

*Products of*  
*the island*  
*Guadalupe.*

with their linen; and sent captain *Hojeda*, with forty men, to look for those that were stray'd, and pry into the nature of the country, where he found mastick, aloes, sandal, ginger, frankincense, and some tices in taste and smell like cinamon, abundance of cotton, and many falcons, and saw two of them pursuing the other birds; they also saw kites, herons, daws, turtles, partridges, geese, and nightingals, and affirm'd that in travelling six leagues, they cross'd 26 rivers, several whereof were vast deep, which makes me believe, that the country being uncouth, they often cross'd the same river. Whilst these were admiring at what they saw, and other companies went about the island, seeking the stragglers, they returned to the ships without being met by any that

look'd for them, on *Friday* the 8th of *November*, saying the thickness of the woods was the cause they had lost themselves. The admiral to punish their presumption, commanded the captain to be cast into irons, and the rest to suffer by retrenching their allowance of provisions. Then he landed, and went to some houses, where he saw all the things above-mentioned, especially a great deal of cotton spun and unspun, looms to weave, abundance of mens skulls hung up, and baskets full of mens bones. These houses they saw were the best, and more plentifully stored with provisions, and other things necessary for the use of the *Indians*, than any others the admiral saw in the islands at his first voyage.

## C H A P. XLVIII.

*How the admiral departed from the island Guadalupe, and of some islands he found in his way.*

Monfe-  
ratic  
island.

ON *Sunday* the tenth of *November* the admiral weighed anchor, and sailed with the whole fleet along the coast of the island *Guadalupe*, towards the north-west for *Hispaniola*, and came to the island *Monferatte*, calling it by that name, because of its height, and understood by the *Indians* he had with him, that the *Caribbees* had unpeopled it, devouring the inhabitants.

Redonda.

Thence he proceeded to *St. Mary Redonda*, so called, because it is so round and upright, that there seems to be no getting into it without ladders, which the *Indians* call'd *Ocamaniro*. Next he came to *St. Maria la Antigua*, which is above 28 leagues in extent. Still holding on his course north-west, there appeared several other islands towards the north, and lying north-west and south-east, all very high and full of woods, in one of which they cast anchor, and call'd it *St.*

or Martin.

*Martin*, where they took up pieces of coral, sticking to the anchor flooks, which made them hope they should find other useful things in those countries. Tho' the admiral was very desirous to know every thing, yet he resolv'd to hold on his course towards *Hispaniola*, to relieve those he had left there, but the weather being bad, he came to an anchor on *Thursday* the thirteenth of *November*, in an island, where he ordered some *Indians* to be taken, to know whereabouts he was. As the boat was returning to the fleet with four women, and three children the men had taken, it met a canoe, in which there were four men and one woman,

who perceiving they could not make their escape, stood upon their guard, and hit two of the christians with their arrows, which they let fly with such force and dexterity, that the woman shot a target quite thro'; but the boat furiously boarding, the canoe overset, so that they took them all swimming in the water, and one of them swimming shot several arrows, as if he had been upon dry land. These had their members cut off, for they are taken by the *Caribbees* in other islands, and gelt, as we do to fat capons, that they may be more pleasing to the taste. The admiral departing hence, continued his voyage W. N. W. where he found above fifty islands, which he left to the northward; the biggest of them he called *St. Ursula*, and the others the *Eleven thousand virgins*. Next he came to the island which he call'd *St. John Baptist*, but the *Indians* *Borriquen*, and the fleet anchored in a bay on the west side of it, where they took several sorts of fish, as skate, olaves, pilchards, and shads, and saw falcons, and bushes like wild vines. More to the eastward, some christians went to certain houses well built after their fashion, with a square before them, and a broad road down to the sea, with towers made of cane on both sides, and the top of them, curiously interwoven with greens, as is seen in the gardens of *Valencia*. At the end of it next the sea, was a rais'd gallery or balcony that could hold ten or twelve people, lofty and well built.

*How the admiral arrived at Hispaniola, where he understood the Spaniards were dead.*

*An Indian* **O**N Friday the twelfth of November, the admiral came up with the north side of Hispaniola, and presently sent ashore at Samana, one of the Indians born in that part, whom he brought out of Spain, being then converted to our holy faith, who offer'd to reduce all the Indians to submit to the christians. The admiral continuing his voyage towards the town of Natal, or the Nativity, when he came to cape Angel, some Indians went aboard, to barter their commodities with the christians. Coming to an anchor in the port of Monte Cbristo, a boat that went ashore, found near a river two dead men, one of them seemed to be young, the other old, who had a rope made of a certain sort of broom, or such like furze that grows in Spain, called *Esparto*, about his neck, his arms extended, and his hands tied to a piece of wood, in the form of a cross; but they could not discern whether they were christians or Indians, but look upon it as an ill omen. The next day being the 26th of November, the admiral sent ashore in several places, the Indians came very friendly and boldly to talk with the christians, and touching our men's shirts and doublets, said shirt, doublet in *Spanish*, to shew they knew how those things were called, which delivered the admiral from the jealousy he had con-

ceived, on account of the dead men, judging that if those people had wronged the christians left there, they had not come so boldly aboard the ships. But the next day, when he came to an anchor near the town of Navidad, or the nativity, after midnight, a canoe came to the fleet, and asked for the admiral, and being bid to come aboard, for he was there, they would not do it, saying, they were resolved not to go aboard till they saw and knew him. The admiral therefore was forced to come to the ship's side to hear them, and then presently two went up with two masks, which they gave to the admiral, from the *Cacique Guacanagari*, saying, he sent many commendations. They being asked by the admiral concerning the christians left there, answered, that some of them died of distempers, some parted from their company, and some were gone into other countries; but that all of them had four or five wives, tho' it appeared by their way of speaking, that all or most of them were dead; yet the admiral not thinking fit to take any notice at that time, sent back the Indians, with a present of some things made of latten, and other baubles, for *Guacanagari*, and themselves, and so they went away that same night, with the gifts for the *Cacique*.

C H A P. L.

*How the admiral went to the town of Navidad, or the Nativity, found it forsaken and burnt, and had an interview with King Guacanagari.*

*St. John, or Borriquen.* **O**N Thursday the 28th of November, about evening, the admiral with all his fleet came into the port, before the town of Navidad or the Nativity, found it all burnt, and that day no body was seen all about there: Next day in the morning, the admiral landed very much concern'd to see the houses and fort burnt, and nothing left belonging to the christians, but only ragged cloaths and such like things, as is usual in a place plunder'd and destroy'd; and seeing no body to enquire of, the admiral went with some boats up a river that was hard by. Whilst he was going up it, he ordered the well he had made in the fort, to be cleansed, thinking to find gold in it; because at his going away, fearing what might happen, he commanded those he left behind, to throw all the gold they could get into that well,

but nothing was found in it; and the admiral that way he went up with his boats, could lay hold of no Indian, because they all fled from their houses, to the woods. Having therefore found nothing but some of the christians cloaths, he returned to Navidad, where he saw eight of the christians, and three others, in the fields near the town, whom they knew to be christians by their cloaths, and they seem'd to have been dead about a month. The christians going about to seek some other tokens, or writings of the dead, a brother of the *Cacique Guacanagari*, came with some Indians to talk with the admiral. These could speak some words of *Spanish*, and knew the names all of the christians, that had been left there, and said that those Spaniards soon began to fall at variance among themselves, and to take every one

*How the  
Spaniards  
left in Illi-  
caniola  
before de-  
parted.*

what gold and as many women as they could; whereupon *Peter Gutierrez* and *Ejcovado* kill'd one *James*, and then they and nine others went away with their women to a *Cacique*, whose name was *Caunabo*, who was lord of the mines, and kill'd them all; then many days after came with a great many men to *Navidad*, where there was only *James de Arana*, with ten men, who had remained with him to guard the fort, all the rest being disperied about the island. The *Cacique Caunabo* coming up by night, fired the houses where the christians liv'd with their women, for fear wherof they fled to the sea, where eight of them were drowned, and three died ashore, whom they shew'd. That *Guacanagari* himself, fighting with *Caunabo* in defence of the christians, was wounded and fled. This account agreed with that given by other christians, sent by the admiral to learn more of the country, who went to a town where *Guacanagari* lay ill of a wound, which he said had hindred him from waiting on the admiral, and giving him an account of what was become of the christians; among whom he said, soon after the admiral returned for *Spain*, there began to be diffension, and every one would barter gold for himself, and take what woman he thought fit; and not satisfied with what *Guacanagari* gave and allowed to be given them, they divided into several parcels, and disperied some one way and some another, and that some *Biscainers* joyning together, went where they were all kill'd; and this was the

truth of what had happened, which they might tell the admiral, desiring him by those same christians, that he would go see him, because he was in such a condition that he could not leave his house. The admiral did so, going the next day to visit him, and he with great signs of sorrow, told him all that had happened, as has been related above, and that he and his men had been all wounded in defence of the christians, as appeared by their wounds, which were not given by christian arms, but with *Arayas*, or wooden swords, and arrows pointed with fish bones. This discourse being over, he presented the admiral with 8 strings of small beads, made of white, green, and red stones, a string of gold beads, a regal crown of gold, and three little calabashes full of gold sand, all which might be about 4 mark weight in gold, each mark being half a pound. The admiral in return, gave him abundance of our baubles, which might be worth three royals, (or eighteen pence) and were valued by him above a thousand. Tho' he was very ill, he would needs go with the admiral to see the fleet, where he was courteously entertain'd and much pleased to see the horses, of which the christians had before given him an account. And because some of those that were dead, had misinform'd him concerning our holy faith, the admiral was forced to instruct him in it, and afterwards would have him wear an image of the virgin *Mary* about his neck, which at first he had refused to receive.

## CH A P. LI.

*How the admiral left the colony of Navidad, and went to found the city which he call'd Isabella.*

THE admiral reflecting on the disaster of those christians, and his own misfortune at sea, having lost the men and fort ashore, and his ship upon the water, and that not far off there were better and more commodious places to plant a colony; on Saturday the 7th of December, he sail'd with the whole fleet eastward, and about evening cast anchor not far from the islands of *Monte Christo*, and the next day at *Monte Christo*, among those seven low little islands, whereof mention has been made already, which, tho' they are without trees, are nevertheless pleasant; for in that winter season, they there found flowers, and nests with eggs, others with young birds, and all other things that are seen in summer. Thence he went to anchor before a town of *Indians*, where resolved to plant a colony, he landed with all the men, provisions and

utensils he brought aboard the fleet, in a plain near a rock, on which a fort might conveniently be built, where he built a town and call'd it *Isabella*, in honour of queen *Isabel* or *Elizabeth*. This place was judged very convenient, forasmuch as the port was very large, tho' expos'd to the north-west, and had a most delicate river a bow shot from it, from which canals of water might be drawn to run thro' the middle of the town, and beyond was a mighty open plain, from which the *Indians* laid the mines of *Cibao* were not very remote. For these reasons the admiral was so eager upon settling the said colony, that what with the fatigue endured at sea, and what he here went thro', he not only wanted time to write day by day what happened, according to his custom, but it happen'd he fell sick, which interrupted his writing from the

writing from  
the

the 11th of December, till the 12th of March, in the year 1494. During which time, having ordered the affairs of the town the best he could, for affairs abroad, he sent one *Alonso de Hojeda*, with 15 men to seek out the mines of *Cibao*. Afterwards on the 2d of February, 12 ships of the fleet returned to *Castile*, under the command of one captain *Antony de Torres*, brother to prince *John's* nurse, a man of great judgment and honour, and in whom their catholic majesties and the admiral much confided. He had all in writing at large that had happened, as also the nature of the country, and what it required. Not long after *Hojeda* returned, and giving an account of his journey, said, That the 2d day, after he set out for *Isabella*, he lay at the foot of a mountain, which was very difficult of access, that afterwards, at every league's distance he found *Caciques*, who had been very kind to him; and continuing his journey the 6th day after he set out, he came to the mines of *Cibao*, where the *Indians* immediately before him, took up gold in a small river, as they had done in many others of the same province, were he affirm'd there was great plenty of gold. This news much rejoiced the admiral, who was then recovered of his sickness, and he resolved to go ashore, to observe the disposition of the country, that he might the better know what was to be done. Accordingly on Wednesday the 12th of March, 1494, he set out from *Isabella* from *Cibao*, to see the mines, with all the people that were in health, both a foot and a horseback, leaving a good guard in the two ships and three caravals that remained of the fleet, and causing all the ammunition and tackle belonging to the other ships, to be put aboard his own, that none might rebel with them as they had attempted to do whilst he was sick. Because many having gone that voyage, upon the belief, that as soon as they landed they might load themselves with gold, and so return rich home, (which gold, wheresoever it is found, requires time, trouble, and labour to gather it) the thing not falling out as they expected; being therefore dissatisfied and offended, as also because of the building of the new town, and weary of the diseases, the climate and change of diet caused among them, they had privately conspired to revolt from the admiral, and taking the ships that remain'd, by force to return in them to *Spain*. One *Bernard de Piza*, who had been an officer of justice at court, and went that voyage in the quality of their catholic majesties controller, was the ring-leader and head of these mutineers; therefore the admiral, when informed of it, would not punish him any otherwise, than by se-

curing him aboard a ship, with a design to send him afterwards into *Spain*, with his process drawn up, as well for mutinying, as for having writ a false information against the admiral, which he had hid in the ship. Having therefore ordered all these affairs, and having left some persons both at sea and ashore, together with his Brother *D. James Columbus* to look to, and secure the fleet, he set forwards towards *Cibao*, carrying along with him all the tools and necessities to build a fort, to keep that province under, and secure the christians left there to gather gold, against any attempts or designs of the *Indians*. And the more to terrify them, and take away all hopes that they might do in the admiral's presence, as they had done in his absence with *Arana*, and the 38 christians left among them; he then carried along with him all the men he could, that they might in their own towns see and be sensible of the power of the christians, and be sensible that whensoever any wrong was done to one single man of ours travelling through the country, there was a force of men to chastize it. And to appear the more formidable, when he set out for *Isabella* and other towns, he made his men march with their arms in rank and file, as is usual in time of war, and with trumpets sounding, and colours flying. In his way he march'd along that river, which lay about a musquet shot from *Isabella*; and a league beyond, he cross'd another less river, and went to lie that night three leagues off in a plain, divided into pleasant fields, reaching to the foot of a craggy hill, and about two bow shots high. This he call'd *Puerto de los Hidalgos*, or the gentleman's port, (the *Spaniards* call passes on mountains, dry ports) because some gentlemen went before to order the road to be made, and this was the first road made in the *Indies*; for the *Indians* make their ways broad enough but for one man to pass at a time. Beyond this pass, he came into a large plain, over which he travelled five leagues the next day, and went to lie near a great river, which the men pass'd upon floats and in canoes. This river which he call'd of *Canes*, fell into the sea at *Monte Cbristo*. In his journey, he pass'd by many *Indian* towns, the houses whereof were round, thatch'd, and with such a little door, that he who goes in must stoop very low. Here, as soon as some of the *Indians* brought from *Isabella*, went into the houses, they took what they liked best, and yet the owners were not at all displeas'd, as if all things were in common. In the like manner, the people of the country, coming near to any christian, would take from him what they thought fit, thinking our things had been as common as theirs.

But

Conspir-  
cy against  
the admi-  
ral.

His fear  
ney to the  
main.

But they were soon undeceiv'd, being told the contrary. In their way they pass'd over mountains most pleasantly wooded, where there were wild vines, aloes, and cinnamon trees, and another sort that produces a fruit

like a fig, and were vastly thick at the foot, but the leaves were like those of the apple tree. Of this sort of tree, the scammony is said to come.

## CHAP. LII.

*How the admiral came to the province of Cibao, where he found the gold mines, and built the castle of St. Thomas.*

*A description of the country.*

ON Friday the 14th of March, the admiral set for ward from the river of Canes, and a league and a half from it, found a great river, which he call'd the river of Gold, because in passing it, they gathered some grains of gold. Having pass'd it with some difficulty, he proceeded to a large town, where many of the people fled to the mountains; but most of them fortified their houses, barring their doors with some canes, as if that were a great defence, to hinder any body from coming in: for according to their custom, no man dares break in at the door he finds so barr'd; forasmuch as they have no wooden doors, or other means to shut themselves in, and it seems these bars are sufficient. Hence the admiral went to another fine river, which he call'd the Green River, the banks whereof were covered with bright round stones, and there he rested that night. Holding on his journey the next day, he pass'd by some great towns, where the people had put flicks cross their doors, like the others above-mentioned, and the admiral and his men being tired, they stay'd that night at the foot of a rugged mountain, which he call'd Port Cibao; forasmuch as the province of Cibao begins beyond the mountain. From this the first mountain they pass'd was 11 leagues distant, all which distance is a plain, and the way directly south. Setting out the next day, he travelled along a path, where they were forced with much difficulty, to lead the horses; and thence he sent back some mules to Isabella, to bring bread and wine, for they began to want provisions, and the journey was long; and they suffered the more, because they were not yet used to the Indian diet, as they are now who live and travel in those parts, who find the food of that country more easy of digestion, and more agreeable to that country, than what is carried from Europe, tho' it is not of so great nourishment. Those that went for provisions being returned, the admiral passing over the mountain on Sunday the 16th of March, entered the country of Cibao, which is rough and stony,

full of gravel, plentiful of grafs, and watered by several rivers, in which gold is found. The further they went into this country, the more uncouth they found it, and encumbered with mountains, on the tops whereof, there appeared grains of gold sand; for as the admiral said, the great rains carry it down from the tops of the mountains, to the rivers in small sand. This province is as big as Portugal, and there are in it abundance of mines, and gold in the brooks; but for the most part there are very few trees, and those along the banks of rivers, and are most of them pines and palms of several sorts. Now Hojeda having as was said, travell'd that country the Indians had some knowledge of the christians, so it happened, that what way soever the admiral went, the said Indians came out to the road to meet him, with presents of provisions, and some small quantity of gold dust they had gathered, after they understood they came for it. The admiral perceiving he was now 18 leagues from Isabella, and the country he had left behind very craggy, he order'd a fort to be built in a very pleasant and strong place, which he call'd the castle of St. Thomas, to command the country about the mines, and be a place of safety for the christians that went thither. The command of this new fort he gave to D. Peter Margarite, a person of account, with 56 men, among whom were workmen of all sorts to build the castle, which was built with clay and timber, that being a sufficient strength to keep out any number of Indians that could come against it. Here breaking ground to lay the foundation, and cutting a rock to make the ditches, when they were got two fathom below the stone, they found nests made of hay and straw, and instead of eggs, three or four round stones, as big as oranges, as artificially made, as if they had been cannon balls; and in the river that runs at the foot of that hill, the castle now stands upon, they found stones of several colours, some of them large, of pure marble, and other of jasper.

*The fort of St. Thomas.*

C H A P. LIII.

*How the admiral returned to Isabella, and found that soil was very fruitful.*

THE admiral having given orders for the finishing and fortifying of the castle, set out for *Isabella*, on *Friday* the 21<sup>st</sup> of *March*, and near the green river met the mules going with provisions, and not being able himself to stay there, because of the great rains, he stay'd there, sending the provisions to the fort. Afterwards endeavouring to find the ford of that river, and of the river *del Oro*, which is bigger than *Ebro*, he stayed some days in those *Indian* towns, eating their bread and garlick, which they gave for a small matter. On *Sunday* the 29<sup>th</sup> of *March*, he came to *Isabella*, where melons were already grown, fit to eat, tho' it was not above two months since the seed was put into the ground. So cucumbers came up in 20 days, and a wild vine of that country being prun'd, had produced grapes, which were good and large. The next day, being the 30<sup>th</sup> of *March*, a countryman gathered ears of wheat he had sown at the latter end of *January*. There were also vetches, but much bigger than those they sow'd; and all they sow'd sprang up above ground in three days, and the 25<sup>th</sup> day they eat of it. The stones of fruit set in the ground, sprouted out in seven days, and the vine branches shot out in the same time, and in 25 days after, they gathered green grapes. The sugar canes budded in seven days, which proceeded from the temperature of the climate, not unlike to that of our country, for it was rather cold than hot; besides, that the waters there are very cold, thin, and wholesome. The admiral was well enough pleas'd with the air, the soil and the people of the country. On *Tuesday* the 1<sup>st</sup> of *April*, there came a messenger from fort *St. Thomas*, who brought news, that the *Indians* of that country fled, and that a *Cacique*, whose name was *Caunabo*, was preparing to come and attack the fort. The admiral knowing how inconsiderable the people of that country were, made little account of that report, especially confiding in the horses, by whom the *Indians* were afraid to be devoured, and therefore were so much afraid, that they durst not go into any house where a horse stood. However the admiral thought fit to send more men and provisions, considering that since he design'd to go to discover the continent with three caravals he had left him, it was fit all things should remain quiet behind. Therefore on *Wednesday* the 2<sup>d</sup> of *April*, he

sent 70 men with provisions and ammunition to the fort, 25 of which were to keep guard, and the others help to make another road, the first being very troublesome, as were the fords of the rivers. These being gone, whilst the ships were fitted to go upon the new discovery, he attended to order all things necessary for the town he was building, dividing it into streets, with a convenient market place, and endeavouring to bring the river to it along a large cut canal; for which reason he also made a dam that might serve the mills, because the town being almost a cannon shot from the river, the people would have been troubled to fetch water so far, especially then, when most of them were very weak and indisposed, by reason of the sharpness of the air, which did not agree with them; so that some were sick, and had no other *Spanish* provisions but biscuit and wine, by reason of the ill management of the captains of the ships, as also because in that country nothing keeps so well as in *Spain*. And tho' they had plenty of the country provisions, yet not being used to that food, it did not agree with them. Therefore the admiral had resolv'd to leave but 300 men in the island, and to send the rest into *Spain*, which number, considering the nature of the island, and of the *Indies*, he knew was sufficient to keep that country in subjection to their catholic majesties. In the mean while, because the biscuit grew towards an end, and they had no flour, but wheat; he resolv'd to make some mills, tho' there was no fall of water fit for that purpose within a league of the town, at which work, and all others, he was forced to stand over the workmen, they all endeavouring to save themselves from any labour. After that, he resolv'd to send out all the people that were in health, except handicraft men, and artificers, to the royal plain, that travelling about the country, they might pacify it, strike a terror into the *Indians*, and by degrees be us'd to their food, since they daily felt more want of that of *Spain*. *Hojeda* was sent to command these men, till they came to *St. Thomas*, there to deliver them to *D. Peter Margarite*, who was to lead them about the island, and *Hojeda* himself to command in the fort, he having taken the pains, the winter before, to discover that province of *Cibao*, which in the *Indian* language signifies stony. *Hojeda* set out from *Isabella* on *Wednesday* the 29<sup>th</sup>

Great  
Fruitful-

sent about  
the island.

of April, towards St. Thomas, with all the aforeſaid men, being above 400, and having paſſ'd the river *del Oro*, apprehended the *Cacique* that liv'd there, and a brother a nephew of his, ſending them in irons to the admiral, and cut off the ears of one of his ſubjects, in the great place of his town, becauſe three chriſtians coming from St. Thomas to *Iſabella*, this *Cacique* gave them five *Indians* to carry their cloaths over the river at the ford, and they being come to the middle of the river, returned to their town with them, and the *Cacique* inſtead of puniſhing them, took the cloaths for himſelf, reſuſing to reſtore them. Another *Cacique* who dwelt beyond the river relying on the ſervice he had done the chriſtians, reſolved to go with the priſoners to *Iſabella*, and intercede with the admiral for them, who entertain'd him courteouſly, and ordered that the other *Indians*, with their

hands bound, would be publickly ſentenced to die in the market-place, which the honeſt *Cacique* ſeeing, he with many tears obtained their lives, promiſing they ſhould never be guilty of any other offence. The admiral having diſcharged them all, a man a horſeback came from St. Thomas's, and gave an account, that he had found in that ſame *Cacique*, who had been priſoner in his town, five chriſtians taken by his ſubjects as they were coming for *Iſabella*, and that he frightning the *Indians* with his horſe had releaſed them, above 400 men running away from him, of whom he wounded two in the purſuit; and that when he had paſſ'd the river, he ſaw they turn'd upon the ſaid chriſtians, whereupon he made as if he would go back againſt them, but they for fear of his horſe, all ran away, leaſt the horſe ſhould fly over the river.

#### C H A P. LIV.

*How the admiral ſettled the affairs of the iſland, and went to diſcover Cuba, ſuppoſing it to be the continent.*

A council  
to govern  
Hiſpaniola.

THE admiral being reſolved to go out to diſcover the continent, appointed a council to govern the iſland in his abſence, the perſons it conſiſted of, were, *D. James Columbus*, his brother, with the title of preſident, *F. Boyl*, and *Peter Fernandez Coronell*, Regents, *Alonſo Sanchez de Carvajal* Reſtor of *Bacca*, and *John de Luxan* of *Madrid*, gentlemen to their catholic majeſties. And that there might not want meal for ſupport of the people, he haſtned the building of the mills, notwithstanding the rain and flood very much obſtructed it. From theſe rains, the admiral ſays, proceeds the great moiſture, and conſequently the fruitfulneſs of the iſland, which is ſo wonderful, that they eat fruit of the trees in *November*, when they were bloſſoming aſreſh, which ſhews that they bear twice a year. But herbs and ſeeds grow at all times, and ſo they find on the trees, neſts with eggs, and young birds. As the fruitfulneſs of the ſoil appeared extraordinary, ſo they daily received freſh advices of the wealth of the country; for ſome of thoſe the admiral had ſent out, were always returning with news of new mines diſcovered, beſides the relation of the *Indians* concerning the great plenty of gold found in ſeveral parts of the iſland. The admiral not ſo ſatiſhed, reſolved to go out to diſcover along the coaſt of *Cuba*, not knowing whether it was an iſland or continent. Therefore taking 3 ſhips along with him, he ſet ſail upon *Thurſ-*

day the 24th of April, after noon, and came to an anchor that day at *Monte Chriſto*, weſt of *Iſabella*. On Friday he went to *Guacanagari's* port, thinking to find him there, but he ſeeing the ſhips, fled for fear, tho' his ſubjects falſly affirm'd he would ſoon return. But the admiral not caring to ſtay without great cauſe, departed on Saturday the 26th of April, and went to the iſland *Tortuga*, which lies 6 leagues to the weſtward: He lay by it that night, in a calm with his ſails abroad, the tide running back againſt the currents. Next day the north-weſt winds and currents ſetting from the weſt, oblig'd him to go back to an anchor in the river of *Guadalquivir*, which is in the ſame iſland, there to wait for a wind that would ſtem the current, which both then and the year before, he found to run ſtrong there toward the eaſt. On Tuesday the 29th of the ſame month, the wind being fair, he came to cape *St. Nicholas*, and thence croſs'd over to the iſland of *Cuba*, running along the fourth coaſt of it, and having ſail'd a league beyond *Cabo Puerte*, The admiral put into a large bay which he call'd *Puerto of San Grande*, or great port, the mouth whereof was 150 paces over, and had much water. Here he caſt anchor, and took ſome reſreſhment of broil'd fiſh and oysters, whereof the *Indians* had great ſtore. On the 1ſt of May he continued his voyage along the coaſt, where he found commodious harbours, fine rivers and high mountains. Up-

on the sea, after he left *Tortuga*, he met abundance of the weeds he saw on the ocean, in his voyage to and from *Spain*. He sailing close along the shore, abundance of people came aboard in their canoes from the island, thinking our men were come down from

heaven, bring of their bread, water and fish, and giving it all freely, without asking any thing for it; but the admiral to send them home well pleased, ordered they should be paid, giving them beads, bells, and such-like baubles.

CHAP. LV.

*The admiral discovers the island of Jamaica.*

*Coast of Jamaica.*

ON *Saturday* the 3d of *May*, the admiral resolved to sail over from *Cuba* to *Jamaica*, that he might not leave it behind, without knowing whether the report of such plenty of gold they had there, was in it, prov'd true, and the wind being fair, and he almost half way over, discovered it on *Sunday*. Upon *Monday* he came to an anchor, and thought it the beautifullest of any he had yet seen in the *Indies*, and such multitudes of people in great and small canoes came aboard, that it was astonishing. The next day he ran along the coast to find out harbours, and the boats going to sound the mouths of them, there came out so many canoes and arm'd men, to defend the country, that they were forced to return to the ships, not so much for fear, as to avoid falling to enmity with those people. But afterwards considering, that if they show'd signs of fear the *Indians* would grow proud upon it, they returned together to the port, which the admiral call'd *Puerto Bueno*, that is, good harbour. And because the *Indians* came to drive them off, those in boats gave them such a flight of arrows from their cross-bows, that fix or seven of them being wounded, they retired. The fight ending in this manner; there came a-

bundance of canoes from the neighbouring places in peaceable manner, to see and barter provisions, and several things they brought, and gave for the least trifle that was offered them. In this port, which is like a horse-shoe, the admiral's ship was repaired, it being leaky, and that done, they set sail on *Friday* the 9th of *May*, keeping so close along the coast westward, that the *Indians* follow'd in their canoes to trade, and get something of ours. The wind being somewhat contrary, the admiral could not make so much way as he wish'd, till on *Tuesday* the 14th of *May*, he resolved to stand over again for *Cuba*, to keep along its coast, designing not to return till he had sail'd 5 or 600 leagues and were satisfied whether it was an island or continent. That same day, as he was going off from *Jamaica*, a very young *Indian* came aboard, saying, he would come into *Spain*, and after him came several of his kindred and other people in their canoes, earnestly intreating him to go back, but they could never alter his resolution; and therefore to avoid seeing his sisters cry and sob, he went where they could not come at him. The admiral admiring his resolution, gave order that he should be used with all civility.

CHAP. LVI.

*The admiral from Jamaica returns to the coast of Cuba, still thinking it to be the continent.*

THE admiral leaving *Jamaica* on *Wednesday* the 15th of *May*, came to that point of *Cuba*, which he call'd *Cabo de Santa Cruz*, or cape Holy Cross, and running along the coast, there happened a great storm of thunder and lightning, which together with the flats and currents, put him into no small danger and to very much trouble, being obliged at the same time to struggle against these two evils, which required contrary remedies; for it is a proper remedy against thunder, to strike the sails,

and it is requisite to spread them to avoid the flats, and had this calamity lasted for 8 or 10 leagues, it had been insupportable. But the worst of it was, that all over that sea, both north and north-east, the further they went, the more low little islands they met with, and tho' there were trees in some of them, yet others were sandy, and scarce appear'd above the surface of the water, some a league, some more and some less in compass. True it is, that the nearer they sail'd to *Cuba*, the higher and pleasanter the

*Infinite small islands.*

the little islands appeared, and being a matter of difficulty, and to no purpose, to give every one of them a name, the admiral called them all in general *Jardin de la Reyna*, the queen's garden. But as many islands as he saw that day, he saw many more and bigger the next day, than he had before, and not only to the north-east, but north-west and south-west; insomuch that they counted 160 islands that day, all parted by deep channels, which the ship sail'd through. In some of these islands they saw abundance of cranes, in shape and bigness like those of *Spain*, but that they were as red as scarlet. In others they found abundance of tortoises, and of their eggs, not unlike a hen's, but that the shells are very hard. The tortoises lay these eggs in a hole they make in the sand, and covering them, leave them till the heat of the sun hatches and brings forth the tortoises, which in time grow as big as a buckler, or great target. In these islands they also saw crows and cranes like those of *Spain*, and several crows, and infinite numbers of little birds that sung sweetly, and the very air was as sweet, as if they had been among roses and the finest perfumes in the world, yet the danger was very great, there being such abundance of channels, that much time was spent in finding the way out. In one of these channels, they spy'd a canoe of *Indian* fishermen, who very quietly, without the least concern expected the boat which was making towards them, and being come near, made a sign to them in it, till they had done fishing. Their manner of fishing was so strange and new to our men, that they were willing to comply with them; it was thus: they had ty'd some small fishes they call *Reves*, by the tail, which run themselves against other fish, and with a certain roughness they have from the head to the middle of the back, they stick so fast to the next fish they meet, that when the *Indians* perceive it, drawing their line, they draw them both together; and it was a tortoise our men saw so taken by those fishermen, that fish clinging about the neck of it, where they generally fasten, being by that means safe from the other fish biting them, and have seen them fasten up

Tortoises in  
them.

A pretty  
way of  
fishing.

on vast sharks. When the *Indians* in the canoe had taken their tortoise, and two other fishes they had before, they presently came very friendly to the boat, to know what our men would have, and by their directions went along aboard the ships, where the admiral treated them very courteously, and understood by them that there was an infinite multitude of islands in that sea, and they freely gave all they had, tho' the admiral would suffer nothing to be taken of them but the fish, the rest being their nets, hooks, and calabashes full of water to drink. Having given them some small trifles, they went away very well pleased, and he held on his course with a design not to do so long, because he began to want provisions already, whereas, had he been well stored, he thought not to have returned into *Spain*, but cast about, tho' he was very much spent, not only because he fed ill, but also because he had not stript or lain in a bed ever since he sail'd from *Spain*, till the 19th of *May*, when he writ this, except eight nights, when he was much indisposed. And if he had much care upon him at other times it was doubled this voyage, by reason of the innumerable quantity of islands, among which he was sailing, which were so many, that on the 20th of *May*, he discover'd 71, besides many more he saw W. S. W. at sun-setting. Which islands or sands are not only frightful by their multitude, appearing on all sides; but what is yet more terrible, is, that every night there rises off them a great fogg eastward, so dismal to behold, that it seems as if some great shower of hail would fall; the thunder and lightning are so violent, but when the moon rises, it all vanishes, part of it turning to rain and wind, which is so usual and natural in that country, that it did not only happen all those nights the admiral was there, but I saw the same in those islands in the year 1503, in my return from the discovery of *Vergua*, and generally here at night the wind is north, coming off the island *Cuba*; and afterwards when the sun is up, it comes about east, and follows the sun till it comes to the west.

sail.

## CHAP. LVII.

*Of the great fatigue the admiral underwent sailing among abundance of islands.*

THE admiral still holding on his course westward, among infinite numbers of islands, upon *Thursday* the 22d of *May* came to an island somewhat bigger than the rest, which he call'd *St. Mary*, and landing

at a town, there was in it not one *Indian* would stay to talk to the christians, nor did they find any thing in the houses but fish, which is all the food those people live on, and several dogs like mastiffs, who eat fish

too. Thus without talking to any body, seeing any thing remarkable, he sail'd away north-east, among abundance of islands, in which there were many cranes as red as parrots, and other sorts of birds, dogs like those before mentioned, and abundance of those weeds he saw on the ocean, when he first discover'd the *Indies*. Thus sailing among so many sands and islands, fatigued him very much; for sometimes he was forced to stand west, sometimes north, and sometimes south, according as the channels would permit; for notwithstanding his care in founding, and keeping men upon the round-top to look out, yet the ship often touch'd, and there was no avoiding it, there being no end of the flats on all hands. Sailing on in this manner, he came again to *Cuba*, to take in water, whereof they had much need. And tho' there was no town where they put in, because the place was wooded, yet one of the seamen that went ashore, going up among the trees with a cross-bow to kill some bird or beast, found 30 people arm'd with such weapons as they use, that is, spears, and staves, which they wear instead of swords, and call *Macanas*. Among them he said he saw one clad with a white coat or a vest, down to his knees, and two that carry'd him had them down to their feet, all three of them as white as the *Spaniards*, but that he had no talk with them, because being afraid of such a number, he began to cry out to his companions, and the *Indians* ran away without looking back. Tho' the admiral the next day sent people ashore to know the truth of it, they could not travel above half a league, because of the thickness of the trees and bushes, and because all that coast

As Indian  
clad.

is boggy and muddy, for two leagues up the country, where there are hills and mountains, so that they only saw footsteps of fishermen on the shoar, and abundance of cranes like those in *Spain*, but bigger. Then sailing about 10 leagues westward, they saw houses on the shoar, from which some canoes came with water, and such things as those people eat, which they brought to the christians, who payed well for 'em; and the admiral caused one of those *Indians* to be stopp'd, telling him, and the rest by his interpreter, that he would let him go freely home, as soon as he had directed him in his voyage, and given some account of that country. At which the *Indian* was very much pleased, and assured the admiral that *Cuba* was an island, and that the king or *Cacique* of the western part of it, never spoke to his subjects but by signs by whom all his orders were immediately obeyed, that all that coast was very low, and full of small islands, which was found to be too true, that the next day, being the 11th of *June*, to pass from one channel to another, the admiral was forced to have the ships towed over a flat, where there was not a foot water, and all the breadth of it was not above two ships length. Bearing up closer to *Cuba* they saw tortoises of a vast bigness, and in such numbers, that they covered the sea. At break of day they saw such a cloud of sea crows that they darkened the sun, coming from the seaward to the island, where they all lighted; besides them, abundance of pigeons, and birds of other sorts were seen, and the next day here came such swarms of butterflies, that they darkened the air, and lasted till night, when the great rain carried them away.

## CHAP. LVIII.

*How the admiral returns back towards Hispaniola.*

ON Friday the 13th of *June*, the admiral perceiving that the coast of *Cuba* ran far west, and that it was a matter of the greatest difficulty to sail that way, by reason of the infinite multitude of islands and sands there were on all sides, and that he already began to want provisions, for which reason he could not continue his voyage as he had intended, he resolv'd to return to the town he had begun to build in *Hispaniola*, and to furnish himself with wood and water, he anchored in the island *Evangelista*, which is 30 leagues in compass, and 700 from *Dominica*. Having provided himself with what he wanted, he directed his course southward, hoping to get out better that way,

The admi-  
ral im-  
boy'd.

VOL. II.

and sailing thro' the channel, he saw looked clearest, after sailing a few leagues, found it shut up, which did not a little trouble and terrify the men, seeing themselves as it were hemmed in on all sides, and destitute of provisions and all comfort. But the admiral, who was wife and courageous, perceiving their faint-heartedness, said with a cheerful countenance, that he thank'd God for forcing him back the same way he came; forasmuch as if they had continued their voyage that way they intended to go, it might perhaps have happened they might have run themselves into some place whence it would be hard getting out, and at a time when they had neither ships nor provisions to go back, which at present they could

7 D easily

easily do. Thus with great satisfaction of all the men, he returned to the island *Evangeliſta*, where he had watered, and on *Wednesday* the 25 of *June*, ſailed thence north-weſt towards ſome ſmall iſlands that appeared 5 leagues off. Going ſtill a little forward he came into a ſea ſo patched with green and white, that it looked like one entire ſand, tho' there was two fathom water; along which he ſailed 7 leagues, till he met another ſea, as white as milk, which he much admired, the water being very thick. This ſea dazzled the eyes of all that beheld it, and ſeemed to be all a ſhoal without water enough for the ſhips, yet there were about 3 fathom water. But when he had ſailed about 4 leagues upon that ſea, he came into another ſea, as black as ink, and 5 fathom deep, thro' which he held his courſe till he came up with *Cuba*. Thence ſtanding to the eaſtward, with ſcant winds, thro' narrow channels and ſhoals. On the 30th of *June* as he was writing his journal of the voyage, his ſhip run a ground ſo faſt, that neither anchors nor other inventions, being able to get it off; it pleaded God it was drawn off a-head, tho' with ſome damage, becauſe of its beating on the ſand. However, with

God's aſſiſtance they got off at laſt, and he ſailed on as the wind and ſhoal-water would permit, always thro' a very white ſea, and two fathom deep, neither deeper nor ſhallower, unleſs he came too cloſe to ſome of the ſands, where there was want of water. Beſides which trouble, every day about ſun-ſetting, he was troubled with mighty ſhowers, which riſe in the mountains from the morafſes near the ſea, which were a great fatigue to him, till he came cloſe to *Cuba* towards the eaſt, the way he came at firſt. Thence, as he had found before, came off a moſt fragrant ſcent, as it were of flowers. On the 7th of *July* he landed to hear maſs, and there reſorted to him an old *Cacique* lord of that province, who was very attentive at maſs; when it was ended, by ſigns, and the beſt he could expreſs, he ſaid it was very well done to give thanks to God, becauſe the ſoul which was good, would go to heaven, and the body remain on earth, but that the wicked ſouls muſt go to hell. And among other things ſaid, he had been in the iſland *Hiſpaniola*, where he knew ſome of the chief men; that he had been in *Jamaica*, and a great way towards the weſt of *Cuba*, and that the *Cacique* of that port, was clad like a prieſt.

Notably words of an Indian.

#### CHAP. LIX.

*The great hunger and other calamities the admiral and his men endured, and how he returned to Jamaica.*

THE admiral ſailing thence on *Wednesday* the 16th of *July*, ſtill attended by terrible rains and winds, drew near to cape *Cruz* in *Cuba*, where he was on a ſudden aſſaulted by ſuch a violent rain and ſtorm as bore his ſhip's ſide under water, but it pleaſed God they immediately ſtruck all their ſails, and drop'd their beſt anchors; but they took in ſo much water at the deck, that the men were not able to pump it out, eſpecially in the condition they were, being much ſpent for want of proviſions: For they eat nothing but a pound of rotten biſcuit a day, and about half a pint of wine, unleſs they happened to catch ſome fiſh, which yet they could not keep from one day to the next, proviſions in thoſe parts being of a very flight nature, and becauſe the weather was always more inclinable to heat than in our countries, and this want being common to all, the admiral in his journal ſpeaks thus concerning it. I my ſelf am at the ſame allowance, God grant it may be to his honour, and for your highneſs's ſervice, for I ſhall never again for my own benefit expoſe myſelf to ſuch ſufferings and dangers, never a day paſſing; but I ſee we are

all upon the brink of death. In this danger and diſtreſs he arrived at cape *Cruz* the 18th of *July*, where he was friendly entertained by the *Indians*. They brought him abundance of *Cazabi*, ſo they call their bread made of roots grated, a great deal of fiſh, ſtore of fruit and ſuch other things as they eat. The wind being contrary to ſail for *Hiſpaniola*, he ſtood over to *Jamaica* on *Wednesday* the 22d day of *July*, and ſail'd along weſtward cloſe under the ſhore, the countrey all along moſt delightful and fruitful, with excellent harbours, at every league diſtance, and all the coaſt full of towns, the people whereof followed the ſhips in their canoes, bringing ſuch proviſions as they eat, and much better liked by the chriſtians, than that they found in the other iſlands. The climate, air, and weather was the ſame as the reſt, for in this weſtern part of *Jamaica* there gathered every evening a ſtorm of rain, which laſted about an hour more or leſs, which the admiral ſaid, he attributed to the great woods there in thoſe countries, for that he knew this was uſual at firſt in the *Canary* iſlands, *Madera* and the *Azores*, whereas now the woods are cut down

down that shaded them, there are not so great and frequent storms and rains, as there were formerly. Thus the admiral sail'd on tho' with contrary winds, which obliged him every night to take the shelter of the land, which appeared green, pleasant, fruitful, abounding in provisions, and so populous, that he thought none excell'd it, especially near a bay which he called *De las Vacas*, because there are nine islands close to the land, which he said was high as any he had seen, and believ'd reached above the region where the storms bred, yet it is all peopled, very fruitful and pleasant. This island he judg'd to be 800 miles in compass,

and when fully discovered, computed it to be 50 leagues in length and 20 in breadth. Being much taken with its beauty, he had a great mind to stay there to be fully informed of the nature of it, but the great want of provisions we mention'd, and the leakiness of the vessels would not permit. Therefore as soon as the weather was a little fair, he sail'd away eastward, so that on *Tuesday* the 19th of *Aug.* he lost sight of that island, standing over directly for *Hispaniola*, and call'd the most eastward cape of *Jamaica* on the south coast *Cabo del Farol*.

# CHAP. LX.

*The admiral discovers the south-side of Hispaniola, till he returned east about the town of Isabella.*

South  
side of  
*Hispanio-*  
is disco-  
ver'd.

ON *Wednesday* the 20th of *August*, the admiral had sight of the south-side of *Hispaniola*, and called the first point cape *St. Michael*, which was 30 leagues distant from the easterlyest point of *Jamaica*, yet at present through the ignorance of the sailors it is called cape *Tiburón*. From this cape on *Saturday* the 23d of *August*, there came aboard a *Cacique*, who call'd the admiral by his name, and had some other *Spanish* words, by which he was convinced this was the same land as *Hispaniola*. At the end of *August* he anchor'd in an island, which is called *Alto Velo*, and having lost sight of the other two ships under his command, he caused some men to go ashore in that little island, whence being very high they might see a great way round; but they discovered none of their companions. As they were going aboard they killed eight sea-wolves, that lay asleep on the sand, and took abundance of pig o is and other birds; for that island not been inhabited, nor those creatures us'd to see men, they stood still to be killed with staves. The same they did the two following days, waiting for the ships which had been astray ever since the *Friday* before, till at the end of six days they came, and all three together went away to the island *Beata* twelve leagues distant from *Alto Velo*. Hence they passed on coasting *Hispaniola*, in sight of a delightful country, which was a plain running up a mile from the sea, so populous, that it seem'd to be one continued town for a league in length. In which plain there appear'd a lake five leagues long from east to west. The people therefore of the country having some knowledge of the christians, came aboard in their canoes, bringing news that some *Spaniards* from *Isabella* had

happened to come among them, and that they were all well, which much pleas'd the admiral, and to the end they too might hear of his health, and his company's and of his return, being somewhat more towards the east, he sent nine men to cross the island, passing by the forts of *St. Thomas* and the *Magdalen* to *Isabella*, and he with his three ships still keeping along the coast eastward, sent the boats for water to a place, where a great town appeared. The *Indians* came out against them with bows and poison'd arrows, and with ropes in their hands, making signs that they would bind the christians they should take with them. But as soon as the boats came to the shore, the *Indians* laid down their arms, and offered to bring bread and water, and all they had, asking in their language for the admiral. Going hence they saw in the sea a fish as big as a whale, which on its neck had a great shell, like a tortoise, and bore its head, which was as big as a hoghead, above water, had a tail like a tunny fish, very long, and two large fins on the sides. The admiral by this fish and other signs, perceiving there would be some change of weather, he fought for some harbour to secure himself. And on the 15th of *September* it pleas'd God to show him an island, being near the east part of *Hispaniola*, call'd by the *Indians* *Adamana*, and the weather being very stormy drop'd anchor in the channel, between it and *Hispaniola*, close to a small island that lies between both, where that night he saw the eclipse of the moon, which he said varied 5 hours 23 minutes from *Cadiz* to the place where he was. This I suppose made the bad weather last so long, for he was forced to lie close in that very place till the 20th of the month,

A mon.  
strous fish.

not without fear for the other ships, which could not get in, but it pleased God to save them. Being afterwards together again, on the 24th of September they sail'd to the most easterly point of *Hispaniola*, and thence pass'd over to a little island lying between *Hispaniola* and *S. John de Borriquen*, called by the *Indians* *Mona*. From this island the admiral does not continue the journal of his voyage, nor does he say how he returned to *Isabella*, but only that going from *Mona* to *St. John*, the great toil he had gone through, his own weakness and want of provisions cast him into a dangerous disease between a pestilential fever and a lethargy, which presently depriv'd him of

all his senses and memory. Whereupon all the men aboard the ships resolv'd to desert from the design he had in hand of discovering all the islands of the *Caribbees*, and to return to *Isabella*, where they arriv'd in five days, and on the 29th of September, and there it pleased God to restore his health, tho' his sickness lasted above five months, which was attributed to the great sufferings he had gone through during that voyage, and to his extraordinary weakness; for sometimes he had not sleep three hours in eight days, which seems almost impossible, were not he himself and his men witnesses of the truth of it.

# CHAP. LXI.

*11. the admiral subdued the island Hispaniola, and took such order, that they might not revolt again.*

Bartholomew Columbus.

THE admiral returning to *Hispaniola* from the discovery of *Cuba* and *Jamaica*, found there his brother *Bartholomew Columbus*, who, as was said before, had been sent to treat with the king of *England* about the discovery of the *Indies*. He returned to *Spain* with the grant of his demands, understood at *Paris*, by *Charles* king of *France*, that the admiral his brother had discovered the *Indies*, and he supplied him with 100 crowns to proceed on his journey. Upon this news he made all the haste he could to overtake the admiral in *Spain*; yet when he came to *Sevil*, his brother was set out for the *Indies* with seventeen sail. Therefore to fulfil the orders he had left him at the beginning of the year 1494, he went away to their catholick majesties, carrying me and my brother *D. James Columbus*, to serve prince *John* as his pages, as had been appointed by the queen, who was then at *Valladolid*. As soon as we came thither their majesties sent for *D. Bartholomew Columbus*, and sent him to *Hispaniola* with three ships, where he served some years, as appears by a manuscript I found among his papers, in which are these words. "I served as captain from the 14th of April 1494, till the 12th of March 1496, when the admiral set out for *Spain*, and then I began to act as governor till the 24th of August 1498, when the admiral returned from the discovery of *Paria*, when I again served as captain till the 11th of December 1500, when I returned to *Spain*." But to return to the admiral, he returning from *Cuba*, made him governor of the *Indies*, tho' afterwards there arose a controversy on this account, because

their catholick majesties said they had not granted the admiral power to appoint any such. But to decide this difference their highnesses granted it a-new, and so for the future he was called *Adelantado*, that is, lieutenant of the *Indies*.

The admiral having the assistance and advice of his brother, took some rest, and lived in quiet, tho' on the other side he met with trouble enough, as well from his sickness, as because he found almost all the *Indians* had revolted, through the fault of *D. Peter Margarite*, of whom we spoke above. He tho' obliged to respect and honour him that at his departure for *Cuba*, had left him the command of 360 foot and 14 horse, to travel over the island, and reduce it under the obedience of their catholick majesties and the christians, and particularly the province of *Cibao*, whence the chief profit was expected; yet did all things so much to the contrary, that as soon as the admiral was gone, he went with all his men to the great plain called *Vega Real*, ten leagues from *Isabella*, without stirring to over-run and reduce the island. Hence there ensued discord and factions at *Isabella*; he endeavouring that those of the council instituted by the admiral, should obey his orders, sending them very insolent letters, till perceiving he could not succeed in his design of getting the whole command into his hands, rather than stay the coming of the admiral, who would call him in question for his behaviour, he went aboard the first ships that came from *Spain*, and returned in them, without giving any account of himself, or any ways disposing of the men left under his command. Upon this every

one went away among the *Indians*, where he thought fit, taking away their goods and their women, and committing such outrages, that the *Indians* resolved to be reveng'd on those they found alone, or stragling; so that the *Cacique* of the *Magdalen*, whose name was *Guaguana*, had killed ten, and privately ordered a house to be fired, in which there were eleven sick. But he was severely punished, when the admiral returned; for tho' he himself could not be taken, yet some of his subjects were made prisoners and sent into *Spain* in four ships, *Antony de Torres* brought on the 24th of *February* 1495. Six or seven more, who in other parts of the island had done harm to the christians, suffer'd for it. The *Caciques* had certainly killed many, and would have destroy'd more, but that the admiral came in time to curb them all, who found the island in such disorder, that most of the christians committed a thousand insolencies, for which they were mortally hated by the *Indians*, who refused to submit to them. It was no difficult matter for them all to agree to cast off the *Spanish* yoke; because, as has been said, there were four principal kings or *Caciques*, to whom all the others were subject. The names of those four were *Caunabo*, *Guacanagari*, *Bebechico* and *Guarionex*; and each of these had under him 70 or 80 others little lords; not that they paid tribute or gave any thing, but were obliged, whenever called upon, to assist them in their wars, and till the ground; but *Guacanagari*, one of these who was lord of that part of the island where the town of the *Nativity* had been built, continued a friend to the christians. As soon therefore as he heard of the admiral's coming, he went to visit him, saying, he had no way been aiding or advising with the others, which might appear by the great civility the christians had found in his country, where 100 men had been always very well used and furnished with all things he could get to please them; for which reason, the other kings were become his enemies, and particularly *Bebechico* had killed one of his women, and *Caunabo* had taken another, wherefore he pray'd him to cause her to be restored, and assist him to revenge these wrongs. The admiral resolved to do so, believing what he said was true, because he wept every time he called to mind those that had been killed at the *Nativity*, as if they had been his own children, and he was the more inclinable to it, considering that the discord among them would make it more practicable to conquer the country, and punish the revolt of the other *Indians*, and killing of the christians. Therefore on the 24th of *March* 1495, he

VOL. II.

set out from *Isabella* to carry on the war, and the afore said *Guacanagari* with him, being very desirous to crush his enemies; tho' the undertaking seem'd very difficult, they having raised above 100000 *Indians*, 100000 whereas the admiral had not along with him above 200 christians, 20 horses, and as many dogs. The admiral being acquainted with the nature and qualities of the *Indians*, when he was two days journey from *Isabella*, divided his forces, giving half to his brother the lieutenant, that he might attack that multitude scattered about the plains in two places, believing the terror of hearing the noise in several places would put them to flight sooner than any thing else, as in effect it proved. The battalions of foot on both sides falling upon the multitude of *Indians*, and breaking them with the first discharge of their cross-bows and muskets, the horse and dogs fell in next in most furious manner, that they might not rally, whereupon those faint-hearted creatures fled, some one way, and some another, and our men pursuing and killing a great number, made such havock, that in a short time, through God's assistance they obtained a complete victory, many of the enemies being slain, and others taken, among whom was *Caunabo*, the chief *Cacique* of them all, together with his wives and children. This *Caunabo* afterwards confessed he had killed 20 of the christians left with *Arana* in the town of the *Nativity*, the first voyage when the *Indies* were discovered, and that afterwards, under colour of friendship, he went in great haste to see the town of *Isabella*, to observe how he might best attack it, and do as he had done at the *Nativity*. Of all which things, the admiral had been fully informed by others; and therefore to punish him for that offence, and this second revolt, and gathering of forces he had now march'd against him, and having taken him and his brother, he sent them all prisoners into *Spain*; for he would not without the knowledge of their catholic majesties, execute so considerable a person, being satisfied with punishing some of those that were most in fault. The victory obtain'd, and this man's imprisonment, put the affairs of the christians into such a good posture, that tho' at that time they were but 630, many of them sick, and others women and children; yet in the space of a year, the admiral spent in ranging the island, without being forced to draw sword any more, he reduced it to such obedience, that they all promised to pay tribute to their catholic majesties every three months, that is, all that inhabited the province of *Cibao*, where the gold mines were, from 14 years

7 E

of

of age upward, to pay a large horse-bell full of gold-dust, and all the rest 25 pounds of cotton a head. And that it might be known who had paid this tribute, there was a sort brass and tin coin stamp'd, one of which pieces was to be given to every one that paid, and he to wear it about his neck, that whosoever was found without it might be known not to have paid and punished. And doubtless this order would have proved effectual, had not those troubles we shall speak of afterwards happen'd among the christians; for after the taking of *Caunabo*, the country was so peaceable, that for the future one single christian went safely where he pleased; and the *Indians* themselves would carry him about on their shoulders, which the admiral attributed on-

ly to God and the good fortune of their catholic majesties, considering it had been otherwise impossible for 200 men, half sick and ill-armed, to overthrow such a multitude, which it pleased his divine majesty not only to bring under his command, but to send such scarcity of provisions, and such violent diseases among them, that they were reduced to one third of what they had been at first, to make it appear the more plain, that such miraculous victories, and the subduing of nations are his gift, and not the effect of our power or conduct, or of their want of courage; for tho' our men had been superiour to them, yet their multitude might make amends for any advantage we had over them.

## C H A P. LXII.

*Some remarkable things in the island, as the customs, ceremonies and religion of the Indies.*

*Product of Hispaniola.*

THE people of the island being brought under, and conversing more freely with our men, many other particulars, and the secrets of their religion were found out, but particularly that there were mines of copper, azure and amber; as also ebony, cedar, frankincense, and other rich gums and spice of several sorts, but wild, which being cultivated, might be brought to perfection; as for instance, cinnamon of good colour, but bitter, ginger, long pepper, abundance of mulberry trees for making of silk, which bear leaves all the year, and many other useful trees and plants not known in our parts. Besides, the *Spaniards* were inform'd of many other things relating to their customs, which to me seem to deserve a place in our history. To begin with their religion, I will here set down the admiral's own words, writ by himself, which are these.

"I could discover neither idolatry nor any other sect among them, tho' every one of their kings, who are very many, as well in *Hispaniola*, as in all the other islands and continent, has a house apart from the town, in which there is nothing at all but some wooden images carved, by them called *Cemies*; nor is there any thing done in those houses but what is for the service of those *Cemies*, they repairing to perform certain ceremonies, and pray there, as we do to our churches. In these houses they have a handsome round table, made like a dish, on which is some powder, which they lay on the head of the *Cemies* with a certain cere-

mony; then through a cane that has two branches clapp'd to their nose, they snuff up this powder: The words they say none of our people understand. This powder puts them besides themselves, as as if they were drunk. They also give the image a name, and I believe it is their fathers or grand-fathers, or both; for they have more than one, and some above ten, all in memory of their forefathers, as I said before. I have heard them commend one above another, and have observed them to have more devotion, and show more respect to one than another, as we do in processions in time of need, and the people and *Caciques* boast among themselves of having the best *Cemies*. When they go to these their *Cemies*, they shun the christians, and will not let them go into those houses, and if they suspect they will come, they take away their *Cemies*, and hide them in the woods, for fear they should be taken from them; and what is most ridiculous, they use to steal one another's *Cemies*. It happened once, that the christians on a sudden rushed into the house with them, and presently the *Cemie* cried out, speaking in their language, by which it appeared to be artificially made; for it being hollow, they had applied a trunk to it, which answered to a dark corner of the house covered with boughs and leaves, where a man was concealed who spoke what the *Cacique* ordered him. The *Spaniards* therefore reflecting on what it might be, kick'd down the

sick'd down  
" the

" the *Cemi*, and found as has been said;  
" and the *Cacique* seeing they had disco-  
" vered his practice, earnestly begg'd of  
" them not to speak of it to his subjects,  
" or the other *Indians*, because he kept  
" them in obedience by that policy. This  
" we may say has some resemblance of ido-  
" latry, at least among those who are igno-  
" rant of their *Caciques* fraud, since they  
" believe it is the *Cemi* that speaks, and all  
" of them in general are imposed upon,  
" and only the *Cacique* and he that com-  
" bines with him, abuse their credulity,  
" by which means he draws what tribute  
" he pleases from his people. Most of the  
" *Caciques* have three stones also, to which  
" they and their people show a great de-  
" votion. The one they say helps the corn  
" and all sorts of grain; the second makes  
" women be delivered without pain; and  
" the third procures rain or fair weather,  
" according as they stand in need of either.  
" I sent your highness three of these stones  
" by *Antony de Torres*, and have three more  
" to carry along with me. When these  
" *Indians* die, they have several ways of  
" performing their obsequies, but the man-  
" ner of burying their *Caciques* is thus.  
" They open and dry him at the fire, that  
" he may keep whole. Of others they  
" take only the head, others they bury  
" in a grot or den, and lay a calabash of  
" water and bread on his head; others they

" burn in the house where they die, and  
" when they are at the last gasp, they suf-  
" fer them not to die, but strangle them,  
" and this is done to *Caciques*. Others  
" are turn'd out of the house, and others  
" put them into a hammock, which is their  
" bed, laying bread and water by their head,  
" never returning to see them any more.  
" Some that are dangerously ill, are carri-  
" ed to the *Cacique*, who tells them whe-  
" ther they are to be strangled or not, and  
" what he says is done. I have taken pains  
" to find out what it is they believe, and  
" whether they know what becomes of them  
" after they are dead; especially I en-  
" quired of *Caunabo*, who was the chief-  
" est king in *Hispaniola*, a man in years,  
" knowing, and of a most piercing wit.  
" He and the rest answered, that they go  
" to a certain vale, which every great *Cacique*  
" supposes to be in his country, where  
" they affirm they find their parents, and  
" all their predecessors, and that they eat,  
" have women, and give themselves up to  
" pleasures and pastimes, as appears more  
" at large in the following account, in  
" which I order'd one *F. Roman*, who un-  
" derstood their language, to set down all  
" their ceremonies and antiquities, tho'  
" there are so many fables that nothing  
" can be made of it, but that they have  
" all some regard to a future state, and hold  
" the immortality of the soul.

The MANUSCRIPT of *F. Roman*, concerning the antiquities  
of the *Indians*, which he, as being skill'd in their tongue, has  
carefully gather'd by order of the admiral.

**I** *F. Roman*, a poor anchorite of the order of *St. Jerome*, by order of the most illustrious lord  
admiral, viceroy and governor of the islands and continent of the Indies, write what I could  
bear and learn of the belief, and idolatry of the *Indians*, and how they serve their Gods. Every  
one observe some particular way and superstition and worshipping idols, which they call *Cemis*.  
They think there is an immortal being, like heaven, invisible, and that has a mother, but has  
no beginning, and this being they call *Jocakuvague Maorocon*, and its mother they call *Ata-*  
*bei*, *Iermaoguacar*, *Apito* and *Zuimaco*, which are several names. Those I here write of,  
are the people of the island *Hispaniola*, for I know nothing of the others, having never been  
in them. They also know whence they came, the original of the sun and moon, how the sea was  
made, and whither the dead go. And they believe the dead appear to them upon the roads  
when any of them go alone, for when there are a great many together they do not appear to  
them. All this their ancestors have made them believe, for they can neither read nor tell be-  
yond ten.

## CHAP I.

Whence the *Indians* came, and after what manner.

*Propo-  
sition  
of the  
Indians.*

**T**here is a province in *Hispaniola* call'd  
*Caanan*, in which there is a mountain  
called *Canta*, where there are two grotts or

caverns; the one called *Cacibagiagua*, the  
other *Amaiarva*; most of the people that first  
inhabited the island came out of *Cacibagi-*  
*agua*.

## The first Discovery of

*gua*. These being in those caverns, kept watch by night, and one *Marocael* had the charge of it, who coming one day too late to the door, they say the sun took him away. Seeing therefore that the sun had carried him away for his neglect, they shut the door against him, and so he was turn'd into a stone near the door. Then they say,

that others going a fishing were taken by the sun, and became trees by them call'd *Jobi*, but otherwise *Mirabolani*.

The reason why *Marocael* watch'd and warded, was to observe whether he would fend and distribute the people, and it appears he staid to his own harm.

### CHAP. II.

#### *How the men parted from the women.*

IT happened, that one *Guagugiana*, bid another, whose name was *Giadrucava*, go and gather an herb called *Digo*, wherewith they cleanse their body when they go to wash. He went out before day, the sun took him by the way, and he became a

bird that sings in the morning, like the *Nightingale*, and is call'd *Giabuba Bagiaci*. *Guagugiana* perceiving he did not return, whom he had sent to gather *Digo*, resolv'd to go out of the aforesaid grot *Cacibagiana*.

### CHAP. III.

*Guagugiana* resolv'd to go away in a passion, seeing they did not return whom he had sent to gather *Digo* to wash him, and said to the women, leave your husbands, and let us go into other coun-

tries, and we shall get jewels enough. Leave your children, and let us only carry the herbs along with us, and we will come again for them.

### CHAP. IV.

*Guagugiana* set out with all the women, and went to seek another country, and came to *Matinino*, where he immediately left the women, and went into another country, called *Guanin*, having left the children by a brook. Afterwards, when hunger began to pinch them, they say, they cry'd, and called their mothers, that were gone; and the fathers could not relieve the children, who for hunger, called

their mothers, saying, *Ma, Ma*, to speak, but in truth to beg of the earth. And they thus crying and begging of the earth, saying, *Too, Too*, like one that very earnestly begs a thing, they were transform'd into little creatures like dwarfs, and call'd *Tona*, because of their begging of the earth. And thus all the men were left without women.

### CHAP. V.

THAT there went women again to the said island of *Hispaniola*, formerly called *Aiti*, and so the inhabitants of it are called, and the other islands called them *Bouchi*: And soasmuch as they have no letters, nor way of writing, they can give no good account how they understand this story of their ancestors, and therefore they do not agree in what they say, nor is what they relate to be put into any order. When *Guagugiana*, who carry'd away all the women went off, he took with him the wives of his *Caciques*, whose name was *Anacacugia*, deceiving them as he had done the o-

thers. Besides, a kinsman of *Guagugiana*, who followed him, went upon the sea, and *Guagugiana* said to his kinsman, when he was in the canoe, look what a fine *Cobo* there is in the water, which *Cobo* is the sea-snail, or periwinkle; and he looking down for the *Cobo*, *Guagugiana* his kinsman took him by the feet and threw him into the sea, and so took all the women to himself, and left those at *Matinino*, where it is said there are none but women to this day; and he went away to another island called *Guanin*; and it was so called for what he carried to it when he went thither.

### CHAP.

CHAP. VI.

*Novus*

THAT *Guagugiana* return'd to the same *Canta*, whence he had carried the women: They say that *Guagugiana* being in that country whither he went, saw he had left a woman in the sea, at which he was not pleas'd, and look'd about where to wash himself, being full of those blotches we call the *French Pox*. The woman put him into a *Guanara*, that is, a by-place; and being there, he was heal'd of his sores.

Afterwards he ask'd her leave to go his way, and she gave it him. This woman's name was *Guabonito*; and *Guagugiana* chang'd his name, calling himself from that time forwards, *Biberoci Guabagiona*. And the woman *Guabonito*, gave *Biberoci Guabagiona* much *Guanine* and *Cibe*, that he might carry them tied to his arms; for in those countries, the *Colecibi* are of stone, very like

marble, and they wear them about their wrists and necks; and the *Guanini's* wear them at their ears, making holes in them when they are little, and they found like fine mettles. They say, that *Guabonito*, *Albeborael*, *Guabagiona*, and the father of *Albeborael*, were the first of these *Guanini's*. *Guabagiona* staid in that country with the father, called *Hiauna*, his son from his father took the name *Hia Guaili Guanin*, which signifies son of *Hiauna*, and from thence forward, was called *Guanin*, and is so to this day. And they not knowing how to write, cannot give a good account of these fables, nor can I write them well; wherefore I believe, I mention the last first and the first last. But all I write is related by them, and so I deliver it as I had it from the people of the country.

CHAP. VII.

*How women came again to the aforesaid island Aiti, now called Hispaniola.*

THEY say the men went one day to wash themselves, and when they were in the water it rain'd much, and they were very desirous to have women; and that very often, when it rain'd, they had gone to seek out the track of their women, and could find no news of them; but they say, that as they were washing themselves that day, they saw fall down from the trees, as it were sliding down the branches, the shape of people, which were neither men nor women, nor had the secret parts of men or women, which they went to catch, but they fled as swift as if they had been eagles.

Therefore by order of their *Cacique*, they call'd 2 or 3 men, since they themselves could not catch them, to watch how many there were of them, and find out for each of them a man that was *Caracaracoli*; for those men had rough hands, and therefore would hold fast. They told the *Cacique* they were four, and so they took four men that were *Caracaracoli*, which is a distemper like the itch, that makes the body very rough. When they had taken those creatures, they held a council about them, how to make them women, since they had neither the privities of man or woman.

CHAP. VIII.

*How they found the way to make women.*

*Women*

THEY sought out a bird called *Turiri*, formerly *Turire Cabuvail*, that is, a *Woodpecker*, that makes holes in trees, and taking those creatures that had neither the parts of man nor woman, tied them hands and feet, and bound the said bird to their body; the which bird taking them to be trees, began to work as it uses, pecking and boring that part where womens privities should be; and thus say the ancientest

*Indians*, they came to have women. I writing in haste, and not having paper enough, could not place every thing rightly, but through mistake transpos'd some; but the mistake is not great, for they believe all that is here writ. Let us now return to what we should have said first, that is, my opinion concerning the original and beginning of the sea.

## C H A P. IX.

*How they say the sea was made.*

There was a man they call *Giaia*, whose right name they know not, his son was call'd *Giaiel*, that is, *Giaia's* son. This *Giaiel* intending to kill his father, he banish'd him, where he remain'd an outlaw 4 months; after which his father kill'd him, put his bones into a calabash, and hung it to the top of his house, where it continued some time. It happen'd that being desirous to see his son, *Giaia* one day said to his wife, I have a mind to see our son *Giaiel*, and she was content. Taking down the calabash, he turn'd it over to see his son's bones, and there came out of it abundance

of great and small fishes. Perceiving that the bones were turn'd into fishes, they resolv'd to eat them. Now they say, that one day, when *Giaia* was gone to his *Comibi*, that is, his lands, he had by inheritance, there came 4 sons of a certain woman called, *Itiba Tabuvava*, all born at one birth; for the said woman dying in labour, they cut her open, and took out the said sons; and the first they cut was *Caracaracol*, that is, *Mangy*; which *Caracaracol* had to name . . . . . the others had no name.

Of the  
dead.

## C H A P. X.

HOW the four sons of *Itiba Tabuvava*, who died in labour, went to take down *Giaia's* calabash; in which was his son *Giaiel* who had been converted into fish, and none of them durst lay hold of it but *Dimivan Caracaracol*, who unhung it; and they all eat their belly full of fish, but whilst they were eating, they perceiv'd *Giaia* was coming from his estate, and go-

ing about in that hurry to hang up the calabash; they did not hang it right, so that there ran so much water from it, as overflow'd all the country, and with it came out abundance of fish, and hence they believe the sea had its original. Afterwards they went and met with a man whose name was *Cone*, and he was dumb.

## C H A P. XI.

*What happened to the four brothers, when they fled from Giaia.*

AS soon as they came to *Bassamanaco's* door, and found he brought *Cazzabi*, they said, *Abiacavo Gearocol*; that is, let us be acquainted with this grandfire of ours. So *Deminan Caracaracol*, seeing his brothers before him, went in to try whether he could get some *Cazzabi*, which is the bread they eat there. *Caracaracol* going into the house of *Aiamavaco*, ask'd some *Cazzabi* of him, which, as has been said, is bread. He clapt his hand on his nose, and threw on him a *Guanguaio*, full of *Cogioba*, which he had made that day, and is a sort of powder they take sometimes to purge them, and for other purposes you shall know hereafter. This they take through a cane half a cubit long, one end whereof they put to their nose, and the other to the powder, and so snuff it up, which purges them very much. So he gave him that *Guanguaio* instead of bread, and leaving what he was about, went away very angry because they ask'd it of him — After this, *Caracaracol* return'd

to his brothers, and told them what had happen'd to him with *Baiaimanicoel*, and the stroke he gave him on the shoulder with the *Guanguaio*, and that it pain'd him very much. His brothers look'd upon his shoulder, and perceiv'd it was much swollen, which swelling increas'd so much, that he was like to die. Therefore they endeavour'd to cut it open, and could not; but taking an instrument of stone, they opened it, and out came a live female tortoise; so they built their house, and bred up the tortoise. I understood no more of this matter, and what we have writ signifies but little. They say further, that the sun and moon came out of a grotto, that is in the country of *Cacique*, whose name is *Mancia Tuvel*, and the grotto is called *Giovovava*; and they pay a great veneration to it, and have painted it all after their fashion, without any figure, but leaves, and the like. In the said grotto, there were two little stone *Cemies*, about a quarter of a yard long, their hands bound,

bound, and they look'd as if they sweated. These *Cemi's* they honour'd very much; and when they wanted rain, they say they used to go visit them, and they presently had it. One of the *Cemies* is by them called *Boinaiel*, the other *Maroia*.

CHAP. XII.

*What their opinion is concerning the wandring of the dead, after what manner they are, and what they do.*

*Of the dead.*

THEY hold, there is a place to which the dead go, called *Coabai*, and lying in a part of the island known by the name of *Soraia*. The first that was in *Coabai*, they say, was one *Macbetaurie Guaiava*, who was lord of the said *Coabai*, the habitation and dwelling-place of the dead.

CHAP. XIII.

*Of the figure they assign the dead.*

THEY say they are shut up in the day, and walk abroad in the night; that they feed on a certain fruit, called *Guabazza*, which tastes like a —, that in the day-time they are —, and at night were converted into fruit, and that they feast, and go about with the living; and thus it is they know them: They feel their belly, and if they cannot find their navel, they say they are dead; for they say the dead have no navel; and therefore they are sometimes deceiv'd, when they do not observe this, and lie with some of the women of *Coabai*, whom when they think they have in their arms, they have none, because they vanish on a sudden. This they still believe as to this affair. Whilst a man is living, they call the soul *Goeiz*, and when dead *Opia*, which *Goeiz* they say, often appears to them, as well in the shape of a man as of a woman; and they say, there have been men that would fight with it, and when they came to close, it vanish'd, and the man clapp'd his arms elsewhere about some tree, to which he clung fast. This they believe all in general, great and small, and that it appears to them in the shape of their father, mother, brother, kindred, or any other. The fruit they say the dead feed on, is about the bigness of a quince. The dead do not appear to them in the day-time, but always at night; and therefore if any one ventures to go abroad at night, it is with great fear.

CHAP. XIV.

*Whence they have this, and who makes them hold such an opinion.*

THERE is a sort of men among them, called *Bobuti's*, who have many juggling tricks, as we shall say hereafter, to make them believe, they talk with the dead, that they know all their actions and secrets, and when they are sick, cure them. Thus they impose upon them, which I have seen with my own eyes, tho' as to other particulars I relate only what I have heard from many of them, especially the principal men, with whom I convers'd more than with others; for these believe such fables more firmly than the others; for they have all their superstitions reduced into old songs, and are directed by them, as the *Moors* are by the *Alcoran*. When they sing these songs, they play upon an instrument, called *Maibaran*, made of wood, hollow, strong, yet very thin, and as long as a man's arm; that part where they play on it is made like a smith's tongs, and the other end like a club, so that it looks like a calabash with a long neck. This instrument they play on, and is so loud, that it is heard a league and a half off; and to that musick they sing those songs they have got by heart. The chief men play on it, who learn it from their infancy, and so sing to it according to their custom. Let us now proceed to speak of many other ceremonies and customs of these *Gentiles*.

CHAP.

## C H A P. XV.

*Of the observations of the Indian Buhuitihu's, how they profess physick, teach the people, and are often deceived in their cures.*

ALL or most of the people of the island of *Hispaniola* have abundance of *Cemies*, of several sorts: some have their father, mother, kindred and predecessors: some figures cut in stone and wood, and many of both sorts, some that speak, others that cause things to grow, some that eat; and others that cause rain, and others that make the wind blow; which things those ignorant people believe the idols perform, or rather those devils. They having no knowledge of our holy faith. When any one

is sick, they bring him to *Bubuitibu*, that is, as was said above, the physician. The doctor is obliged to be dieted as the sick man is, and to look like him, which is done thus. He is to purge himself as the sick man does, which is done by snuffing a certain powder, called *Cogiaba*, up his nose, which makes him drunk, that he knows not what he does, and so says many extravagant things, which they affirm is talking with the *Cemies*, and that they tell them how the sickness came.

## C H A P. XVI.

*What these Buhuitihu's do.*

*Cure of the sick.*

WHEN they go to visit any sick body, before they set out from their house, they take the foot off a pot, or pounded charcoal, and black all their face, to make the sick man believe what they please concerning his distemper. Then they take some small bones, and a little flesh, and wrapping them all up in something that they may not drop, put them in their mouth, the sick man being before purged with the powder aforesaid. When the physician is come into the sick man's house, he sits down, and all persons are silent; and if there are any children, they put them out, that they may not hinder the *Bubuitihu* in performing his office; nor does there remain in the house any but one or two of the chief persons: Being thus by themselves, they take some of the herb *Gioia* — broad, and another herb, wrapped up in the web of an onion half a quarter long; one of the *Gioia's*, and the other they hold, and drawing it in their hands they bruise it into a paste, and then put it in their mouths to vomit what they have eaten, that it may not hurt them; then presently begin their song, and lighting a torch, take the juice. This done, having staid a little, the *Bubuitibu* rises up, and and goes towards the sick man, who sits all alone in the middle of the house, as has been said, and turns him twice about, as he thinks fit; then stands before him, takes him by the legs, and feels his thighs, descending by degrees to his feet; then draws hard, as if he would pull something off; then he goes to the door, shuts it, and says, be gone to the mountain, or to

the sea, or whither thou wilt; and giving a blast, as if he blowed something away, turns about, claps his hands together, shuts his mouth, his hands quake as if he were cold, he blows on his hands, and then draws in his blast as if sucking the marrow of a bone, sucks the sick man's neck, stomach, shoulders, jaws, breast, belly and several other parts of his body. This done they begin to cough, and make faces, as if they had eaten some bitter thing, and the doctor pulls out that we said he put into his mouth at home, or by the way, whether stone, flesh or bone, as above. If it is any thing eatable, he says to the sick man, take notice you have eaten something that has caused this distemper; see how I have taken it out of your body; for your *Cemi* had put it into you because you did not pray to him, or build him some temple, or give him some of your goods. If it be a stone, he says, keep it safe. Sometimes they take it for certain, that those stones are good, and help women in labour; wherefore they keep them very carefully, wrapped up in cotton, putting them into little baskets, giving them such as they have themselves to eat, and the same they do to the *Cemies* they have in their houses. Upon any solemn day, when they provide much to eat, whether fish, flesh, or any other thing, they put it all into the house of the *Cemies*, that the idol may feed on it. The next day they carry all home, after the *Cemi* has eaten. And so God help them, as the *Cemi* eats of that, or any other thing, they being inanimate stocks or stones.

*Physician  
purged.*

C H A P. XVII.

*How the aforeſaid phyſicians have been ſometimes deceived.*

WHEN they have done as has been ſaid, and yet the patient dies, if the dead man has many friends, or was lord of a territory, and can oppoſe the ſaid *Bubuitibu*, that is, phyſician, for mean people dare not contend with them; he that would do him harm, does it thus. When they would know whether the patient died through the phyſician's fault or whether he did not obſerve what was preſcribed; they take an herb, called *Gueia*, whoſe leaves are like *Bafil*, thick and broad, being called by another name *Zacbon*: they take the juice of this leaf, pair the dead man's nails, and cut off the hair on his forehead, which they powder between two ſtones, and mix with the aforeſaid juice of the herb, and pour it down the dead man's throat, or noſtrils, and ſo doing, ask him, whether the phyſician was the occaſion of his death? and whether he obſerved order? this they ask ſeveral times, till he ſpeaks as plain, as if he were alive;

ſo that he answers to all they ask of him, ſaying, the *Bubuitibu* did not obſerve order, or was the cauſe of his death; and they ſay, the phyſician asks him, whether he is alive, and how he comes to talk ſo plain; and he answers he is dead. When they have known what they deſire of him, they return him to his grave, whence they took him to make this enquiry. They uſe another method to know what they deſire: they take the dead body and make a great fire, like that uſed for making of charcoal, and when the wood is turned into a live coal, they throw the body into that violent fire, and cover it with earth, as the collier's do the coals, where they let it lie as long as they think fit, and there ask queſtions, as was ſaid before; who answers, he knows nothing. This they ask ten times, and then he ſpeaks no more. They ask, whether he is dead? but he ſpeaks only thoſe ten times.

C H A P. XVIII.

*How the kindred of the party revenge themſelves, when they have got an answer by means of the drench.*

*Phyſicians ſaid.*

THE dead man's kindred get together upon a day appointed, wait for the aforeſaid *Bubuitibu*, and baſtinado him, till they break his legs, arms and head, ſo that he is all battered, and ſo they leave him for dead. At night, they ſay, there come abundance of ſnakes of ſeveral ſorts, white, black, green and of ſeveral other colours, which lick the ſaid phyſician's face, and all his body, ſo left, as has been ſaid, and remains in that manner two or three days. Whiſt he is thus, they ſay the bones of his legs and arms knit together again, he gets up, and walks fair and ſoftly towards his houſe and they that ſaw him, ask the queſtion of him, were not you dead? he answers, the *Cemi's* came to his aſſiſtance in the ſhape of ſnakes. The dead man's kindred, in a rage, becauſe they thought they had revenged their relations death, ſeeing him alive, grow deſperate, and endeavour to lay hold of him to put

him to death; and if they can catch him again, they put out his eyes, and bruife his teſticles; for they ſay none of theſe phyſicians can die, tho' never ſo much baſtinadoed, if they do not cut out his teſticles.

*How they know what they deſire of him they burn, and how they take their revenge.*

When they uncover the fire, the ſmoke that comes from it, riſes till they loſe ſight of it, and makes a noiſe, as it breaks out: Then it turns down again, and goes into the houſe of the *Bubuitibu* or phyſician; and that very moment, he that did not obſerve order, falls ſick, is covered with ſores, and all the ſkin of his body flays off; and this they take for a ſign, that he did not do his duty, and therefore the patient died; for which reaſon they endeavour to kill him, as was ſaid in the other caſe. Theſe are the forceries they uſe.

## CHAP. XIX.

*How they make and keep their wooden and Stone Cemies.**of Cemies  
or idols.*

THOSE of wood are made thus: when any one is traveling, he says, he sees some tree that shakes its root; the man in a great fright, stops, and asks, who he is? it answers, my name is, *Bubuitibu*, and he will inform you who I am: the man repaireing to the said physician, tells him what he has seen. The wizard, or conjurer, runs immediately to see the tree the other has told him of, sits down by it, and makes it *Cogioba*, as was said above in the story of the four brothers. The *Cogioba* being made, he stands up, gives it all its titles, as if it were some great lord; and asks of it, tell me who you are, what you do here, what you will have with me, and why you send for me? tell me whether you will have me cut you, whether you will go along with me, and how you will have me to carry you, and I will build you a house and endow it? immediately, that tree, or *Cemi*, becomes an idol, or devil, answers, telling how he will have him do it. He cuts it into such a shape as he is directed, builds his house, and endows it; and makes *Cogioba* for it several times in the year: which *Cogioba* is to pray to it, to please it, to ask and know of the said *Cemi*, what good or evil is to happen, and to beg wealth of it. When they would know whether they shall be victorious over their enemies, they go into a house, whither none but the chief men are admitted. The lord of them is the first that begins to make the *Cogioba*, and to make a noise; whilst he does it, none of the company speaking till he has done. His prayer being ended, he stands awhile with his head turned about,

and his arms on his knees; then he lifts up his head, and looks towards heaven, and speaks. Then they all answer him with a loud voice, and when they have all spoke, giving thanks, he tells the vision he saw, being made drunk with the *Cogioba*, he snuffed up his nose, which flies into his head; and says, he has talked with the *Cemi*, and shall obtain victory, or that his enemies shall fly, or that there shall be a great mortality, or war, or famine, or some such thing, as occurs to him in his drunken fit. Consider, what a condition their brains are in; for they say, the houses seem to them to be turned topsy turvy, and that the men goupon their heads. This *Cogioba* they make for stone and wooden *Cemies*, as well as for the dead bodies, as has been said above. The stone *Cemies* are of several sorts: some there are, which they say, the physicians take out of the body of the sick, and those they look upon as the best to help women in labour. Others there are that speak, which are shaped like a long turnip, with the leaves long, and extended, like the shrub bearing capers. Those leaves for the most part are like those of the *Lin*. Others have three points, and they think they cause the *Guica* to thrive. Their roots are like a radish. The leaves of *Guica* have at least six or seven points; nor do I know what to compare them to, for I have seen nothing like it in *Spain*, or elsewhere. The stem of the *Guica* is as high as a man. Let us now speak of their opinions concerning the idols and *Cemi*'s, and how they are deceived by them.

## CHAP. XX.

*Of the Cemi, Bugid and Aiba.**Barlamo's  
opinion.*

THEY say, in the time of the wars, he was burnt, and afterwards being wash'd with the juice of *Guica*, his arms grew out again, his body spread, and he recovered his eyes. The *Guica* was small, and they wash'd it with the above-mentioned water and juice, to make it grow bigger, and they affirm it made those sick who had made the said *Cemi*, because they

had not brought it *Guica* to eat. This *Cemi* was called *Baidrama*, and when any one fell sick, they called the *Bubuitibu*, and ask'd him, whence the distemper proceeded? He answered *Baidrama* had sent it, because they had not sent him to eat by those that had charge of his house. This the *Bubuitibu* said the *Cemi*, *Baidrama*, had told him.

CHAP. XXI.

*Of Guamoreté's Cemi.*

THEY say, that when they built the house of *Guamoreté*, who was a man of note, they put into it a *Cemi*, that was on the top of his other house, which *Cemi* was called *Corocofo*; and when they had wars among themselves, *Guamoreté's* enemies burnt the house in which this *Cemi Corocofo* was. They say he presently got up, and went a bow-shot from that place, near to a water. They further say, that when he was on the top of the house, he would

come down and lie with the women. That afterwards *Camorefo* died, and the *Cemi* fell into the hands of another *Cacique*, and still continued to lie with the women; and moreover, that he had two crowns grew on his head; for which reason they said, since such a one has two crowns, he is certainly *Corocofo's* son; and this they look'd upon as most certain. This *Cemi* came afterwards to another *Cacique*, called *Gualabanex*, and his country is called *Giacoba*.

CHAP. XXII.

*Of another Cemi, called Opigielguoviran, which belonged to a great man, whose name was Cavavaniova, who had many subjects.*

THIS *Cemi Opigielguoviran*, they say, has four feet, like a dog's, and is made of wood, and that he would often at night go out of the house into the woods; whither they went to seek him out, and when brought home again, they bound him with cords, yet he would go away to the

woods. They say that when the christians came to the island *Hispaniola*, he broke loose, and went into a moras, whither they followed him by the track, but never saw him since, nor know any thing of him. As I receiv'd this, so I deliver it.

CHAP. XXIII.

*Of another Cemi, called Guabancex.*

THIS *Cemi Guabancex* was in the country of a great *Cacique*, whose name was *Aumatex*; and they say, it is a woman *Cemi*, and has two others with it; one a crier, the other gatherer, or governor of the waters. When *Guabancex* is angry, they say, it raises the winds and waters, overthrowes houses, and shakes the trees. This *Cemi* they say, is a female, and made of stones of that country. The other two

*Cemi's* that are with it, are call'd, one of them *Gualawva*, and is a crier, that by order of *Guabancex*, makes proclamation for all the other *Cemi's* of that province to help to raise a high wind, and cause much rain: The other is, *Coatrisibie*, who they say, gathers the waters in the valleys among the mountains, and then lets them loose to destroy the country. This they believe as most certain.

CHAP. XXIV.

*Their Belief of another Cemi, called Faraguvaol.*

THIS *Cemi* belongs to a principal *Cacique* of the island *Hispaniola*, is an idol, has several names, and was found as you shall now hear. They say, that on a certain day in past times, before the island was discovered, they know not how long since, being abroad a hunting, they found a certain creature: they ran back, and that got into a ditch; looking into it, they saw a beam, which look'd like a thing

that had life in it. The huntsman seeing it, ran to his lord, who was a *Cacique*, and father to *Guarionel*, telling him what he had seen. They went thither, and found the thing as the huntsman had given information, and taking that log, they built a house to it. They say it went out of that house several times, and return'd to the place whence they brought it, not exactly to the same spot, but near it; for the

fore said

aforesaid lord, and his son *Guaraionel*, ordering it to be fought out, found it hid; and that another time, they bound and put it

in a sack, and yet bound as it was, it went away as before. Those ignorant people look upon this as undoubted truth.

#### C H A P. XXV.

*Of those things they affirm were reported by two principal Caciques of the island Hispaniola; one of them called Cazziva, father to the aforesaid Guaraionel; the other, Gamanacoei.*

THAT great lord, who, they say, is in heaven, at the beginning of the book, is this *Cazziva*, who kept a sort of abstinence here, which all of them generally perform; for they shut themselves up six or seven days, without taking any sustenance but the juice of herbs, with which they also wash themselves. After this time they begin to eat something that is nourishing. During the time they have been without eating, weakness makes them say, they have seen something they earnestly desired, for they all perform that abstinence in honour of the *Cemes*, to know whether they shall obtain victory over their enemies, or to acquire wealth, or any other thing they desire. They say, this *Cacique* affirm'd, he had spoke with *Giocauvagbama*, who told him, that whosoever surviv'd him, would not long enjoy his power, because they should see a people clad in their country, who would rule over, and kill them, and they should die for hunger. They thought at first, these should be the *Canibals*, but afterwards considering, that they only plunder'd and fled; they believ'd it was some other people the *Cemi* spoke of; and now they believe it is the admiral and those that came with him. Now I will give an account of what I saw and knew, when *F. Roman*, a poor anchorite, went to the province *Madalena*, to a fort built by *D. Christopher Columbus*, admiral, viceroy, and governor of the islands and continent of the *Indies*, for their majesties king *Ferdinand* and Queen *Isabel*. I being in that fort, with *Arriaga*, appointed governor of it by the aforesaid viceroi *D. Christopher Columbus*, it pleased God to give the light of his faith to a whole family of ill-principled people of that province of *Madalena*, which province was called *Maroris*, and the lord of it *Guaraionel*, that is, son of *Guaraenechin*. In the said house are his servants, and retainers, whose surname is *Giabuvariu*, and were in all 16 persons, all relations, and among them five brothers. Of these one died, and the other four were baptiz'd; and I believe, they died martyrs, for so it appear'd by the manner of their death and their constancy. The first that receiv'd baptism was an *Indian*

called *Guaticava*, afterwards *John*. This was the first christian that suffer'd a cruel death, and to me he seems to have died a martyr; for I have heard from some that were by when he died, that he said, *Dio Aboridacha*, *Dio Aboridacha*, that is, I am God's servant. So died his brother *Arriaguy*, and another with him, saying the same words. All the people of this house attended me, to do whatsoever I pleased. Such as are left alive at this day, are now christians by means of *D. Christopher Columbus*, viceroy and governor of the *Indies*, and by the grace of God they are very numerous at present.

Let us now say what happened in the province of *Madalena*. When I was there, the aforesaid lord admiral came to the assistance of *Arriaga*, and some christians, besieged by the subjects of a principal *Cacique*, called *Caualto*. The admiral told me, that the language of the province *Madalena Maroris* was different from the rest, and not understood in all parts of the country; and therefore bid me go and reside with another principal *Cacique*, called *Guarionex*, lord of many subjects, whose language was understood all over the island. In obedience to his orders, I went to reside with the said *Guarionex*. True it is, I said to *D. Christopher Columbus*, my lord, why will you have me go to live with *Guarionex*, when I know no language but that of *Maroris*? Be pleas'd to give leave that one of those *Nobuirci's*, (who were afterwards christians, and knew both the languages) may go along with me; which he granted, and bid me carry who I pleas'd; and it pleased God to give me for a companion, the best of the *Indians*, and who was best instructed in the catholic faith; and afterwards took him from me, God be praised who gave and took him away; for indeed, I look'd upon him as a good child and a brother; and it was that *Guacavannu*, who was afterwards a christian, and called *John*. What happened to us there I shall not relate, and how I and *Guacavannu* went to *Isabella*, where we waited for the admiral, till he return'd from the relief of *Madalena*. As soon he came, we went where he had ordered, with one *John de Aguada*, who had

de *Aguada*, who  
had***

had the command of a fort, which *D. Christopher Columbus* had built, half a league from the place where we were to reside. The admiral commanded the said *John de Aguada* to allow us such provisions as there were in the fort, which is called the *Conception*. We continued with that *Cacique, Guarionex*, almost two years, instructing him in our faith, and the manners of christians. At first he appear'd well inclin'd, and gave some hopes of complying and becoming a christian, bidding us teach him the lord's prayer, the creed, and all other christian prayers, which many in his house learnt; and he said his prayers every morning, and caus'd all his family to do so twice a day: yet afterwards he fell off from his good purpose, through the fault of some of the principalmen of that country, who blam'd him for submitting to the law of christ, since the christians were ill men, and drove them out of their country by force. Therefore they advis'd him never to mind any thing that belong'd to the christians; but that he should joyn and conspire with them, for their destruction, because they could not satisfy them, and were resolv'd to submit no longer. Thus he fell off from his good beginning, and we perceiving he neglected what he had learnt, resolv'd to depart thence, and go where we might be more successful in instructing the *Indians* in the faith. We therefore went away to another principal *Cacique*, who show'd a favourable inclination, saying, he would be a christian: his name was *Maviatue*.

Accordingly we set out to go to the said *Maviatue's* country; I *F. Roman* *Pano*, poor anchorite, and *F. John Borgnon* of the order of *St. Francis*, and *John Mathew* the first that was baptized in *Hispaniola*.

The second day after we set out from the town and habitation of *Guarionex*, to go to the other *Cacique*, called *Maviatue*; we found *Guarionex's* people building a house near the house of prayer, where we left some pictures for the *Catecumen's*, to knee, and pray before them. These were the mother, brothers, and kindred, of the aforesaid *John Mathew*, the first christian; afterwards seven more joyn'd them, and at last all the family became christians, and persever'd in the faith; so that all the aforesaid family was left to keep that house of prayer, and some lands I had caus'd to be till'd. They being so left to keep the house, two days after we were gone towards the aforesaid *Maviatue*, six men went to the aforesaid house of prayer, left in the custody of the seven *Catecumen's*, and by order of *Guarionex*, told them, they should take those pictures, left by *F. Roman*, and destroy them, since he and his companion were gone, and they knew not what was become of them. These six servants of *Guarionex* found six children keeping the house of prayer, who being so instructed, said, they should not come in; but they went in by force, took the pictures, and carried them away.

## CHAP. XXVI.

*What became of the pictures, and a miracle God wrought to show his power.*

THESE men being gone out of the house, threw the pictures down, cover'd them with earth, and piss'd upon them, saying, now you will yield much fruit. This they said, because they bury'd them in a field that was sown, saying, what grew there would be good, but this they did in scorn. The children that were keeping the house by order of the *Catecumen's*, seeing this, they ran to their friends who were upon their Lands, and told them, that *Guarionex's* men had abus'd and scorn'd the pictures; which they understanding, left what they were about, and ran crying out to give an account of it to *D. Bartholomew Columbus*, who was then governor, his brother being gone into *Spain*. He as lieutenant to the viceroy, proceeded against the offenders, and having convicted them publicly, burnt them. This did not deter

*Guarionex* and his subjects, from their design of murdering all the christians on the day when they were to bring in their tribute; but the conspiracy was discovered, and they apprehended on the same day they were to put it in execution. Still they held on their resolution, and accordingly killed four *Spaniards*, besides *John Mathew* and his brother *Anthony*, who had been baptized; and running where they had hid the pictures, tore them in pieces. Some days after, the owner of that field went to dig up his *Ag's*, which are certain roots like turnips, and some like radishes; and in the place where the pictures had been buried, two or three *Ag's* were grown in the shape of a cross, as if they had been stuck one through another; nor could any man find this cross, but only the mother of *Guarionex*, who was the worst woman I knew in those

parts, who look'd upon this as a great miracle, and said to the commander of the fort of the *conception*, this miracle has been shown by God, where the images were found: God knows to what end.

Let us now give an account, how they were converted that first became christians, and how much will be requisite to convert them all. To say the truth, that island stands in much need of people to punish the lords, when they will not suffer their people to be instructed in the faith; for they have nothing to say against it, which I can with truth maintain, because it has cost me much labour to know it; as I am satisfied may be gathered by what has been said hitherto; and a word to the wife is enough.

The first christians were those we have beforement'd in the island of *Hispaniola*, that is, *Gianauery*, in whose house there were seventeen persons who all became christians, only giving them to understand, that there is one God, who has made all things, and created heaven and earth, without any further arguments or controversy; for they were easy of belief. With others there must be force and ingenuity used, for all of them are not alike; for as much, as if those had a good beginning and a better end, they were none of those others that

begin well, and then fall off from what has been taught them; and therefore there is need of force and punishment.

The first that receiv'd baptism in the island *Hispaniola*, was *John Matthew*, who was baptiz'd on the feast of St. *Matthew* the evangelist, in the year 1496, and after him all his family; where were many christians, and a greater progress had been made, had they been instructed in the faith, and the *Spaniards* been in a condition to keep them under. And if any one should ask, why I make this so easy a matter? I say, it is, because I know it by experience, especially in the person of a principal *Cacique*, called, *Mabaviavira*, who has continued now for three years in his good purpose, saying, he will be a christian, and have but one wife; for they use to have two or three, and the great men twenty five or thirty. This is what I could learn and find out as to the customs and ceremonies of the *Indians* of *Hispaniola*, with all the pains I have taken; wherein I expect no spiritual, nor temporal advantage. May it please our lord, if this turns to his honour and service, to give me his grace to persevere; and if it must fail out otherwise, may he deprive me of my understanding.

*The end of the work of the poor anchorite Roman Pane.*

#### CHAP. LXIII.

*How the admiral return'd to Spain to give their majesties an account of the condition he left the island in.*

TO return to the main subject of our history; I say, the admiral having brought the island into a peaceable condition, and built the town of *Isabella*, besides three forts about the countrey, he resolv'd to return into *Spain*, to acquaint their catholic majesties with several matters he thought convenient for their service; but particularly because of many malicious slanderers, who through envy ceased not to give the king a false information of the affairs of the *Indies*, to the great prejudice and dishonour of the admiral and his brothers. For these reasons he went on board on *Thursday* the 10th of *March* 1496, with 225 *Spaniards* and 30 *Indians* sailed from *Isabella* about break of day, and turned it along the coast with two caravals, one called *Santa Cruz*, the other *Nina*, the same he went in to discover the island of *Cuba*. On *Tuesday* the 22d of *March*, he lost sight of the east point of *Hispaniola*, holding on his course eastward as the wind would per-

mit. But the wind for the most part continuing at east, on the 6th of *April*, finding his provisions fell short, and his men were weary and discouraged, he fell off towards the south to the *Caribbee* islands, and came up with them in three days, anchoring at *Marigalante* on *Saturday* the 9th of *April*. The next day, tho' it was not his custom to weigh anchor on a *Sunday*, when in any port, he set sail, because his men mutter'd, saying, when they were to seek their bread, they needed not so strictly observe days. So he anchor'd at the island *Guadalupe*, and sending the boats well-mann'd ashore, before they came to land, abundance of women came out of a wood, with bows and arrows and feathers, as if they would defend their island. For this reason, and because the sea ran somewhat high, those in the boats kept aloof, and sent two *Indian* women, they brought from *Hispaniola*, ashore swimming, of whom those other women particularly enquired concern-

ing,

island. For this  
sea ran somewhat  
kept aloof, and  
they brought from  
ng, of whom those  
enquired concern-  
ing,

ing the christians; and understanding they  
only desired provisions in exchange for such  
things as they had, bid them go with their  
ships to the north-side, where their husbands  
were, who would furnish them with what  
they wanted. The ships sailing close under  
the shore, saw abundance of people come  
down to the shore with bows and arrows,  
who let fly upon our men with great cries,  
tho' in vain, for their arrows fell short.  
But perceiving the boats full of men were  
going ashore, the Indians went ba & into  
an ambush, and when our men drew near,  
came out to hinder their landing, till being  
frighted with the cannon fir'd at them from  
the ships, they fled to the wood, leaving  
their houses and goods, where the christi-  
ans took and destroy'd all they found. Be-  
ing acquainted with the way of making  
bread, they fell to work, and made enough  
to supply their want. Among other things  
they found in the houses, there were great  
parrots, honey, wax and iron, whereof  
they had hatchets to cut, and looms like  
those for tapistry-work, in which they weave  
their tents. Their houses were square, and  
not round, as is usual in the other islands.  
In one of them was found the arm of a man  
roasting upon a spit. Whilst the bread  
was making, the admiral sent forty men  
up the country, to learn something of it;  
who the next day return'd with ten women  
and three boys, the rest of the people be-  
ing fled. Among these women, was the  
wife of a Cacique, whom a Canaryman, that  
was very nimble, had much difficulty to  
overtake; and she had got from him, but  
that seeing him alone, she thought to take  
him, and closing she got him down, and  
had stifled him, but that others came in to

his assistance. These womens legs are  
swathed with cotton from the ankle to the  
knee, that they may look thick, which or-  
nament they call *Cairo*, and look upon it  
as very genteel, and they gird so hard, that  
if it happens to slip off the leg, that part  
appears very thin. The same both men  
and women use in *Jamaica*, who swath their  
arms up to the arm-pits, that is, about the  
smallest parts, like the old fashion sleeves  
used among us. These women are also  
excessive fat, and there were some thicker  
than a man could grasp; as soon as chil-  
dren can stand upon their legs and walk,  
they give them a bow, that they may learn  
to shoot; and they all wear their hair long,  
and loose upon their shoulders, nor do they  
cover any part of the body. That lady  
they took said, the island was only inhab-  
ited by women, and that those who would  
have hindered the men landing were wo-  
men, except only four men, who were there  
accidentally from another island; for at a  
certain time in the year they come to sport,  
and lie with them. The same was observ-  
ed by the women of another island, called  
*Matrimonio*, of whom she gave the same  
account we read of the *Amazons*; and the  
admiral believed it by what he saw among  
those women, and and because of the cou-  
rage and strength that appeared in them.  
They also say, those women seem to be en-  
dow'd with clearer understanding than those  
of the other islands; for in other places they  
only reckon the day by the sun, and the  
night by the moon, whereas these women  
reckoned by other stars, saying, when the  
*Charles Wain* rises, or such a star is north,  
then it is time to do so and so.

# CHAP. LXIV.

*The admiral sails from the island Guadalupe for Spain.*

WHEN they had made provision of  
bread for twenty days, besides what  
they had aboard, the admiral resolv'd to  
continue his voyage towards *Spain*; but  
perceiving that island was an inlet to the  
others, he thought fit first to satisfy those  
women with some gifts, in satisfaction for  
the loss they had sustained, and therefore  
sent them all ashore, except the chief lady,  
who chose to go into *Spain* with her daugh-  
ter, among the other *Indians* of the island  
*Hispaniola*, one of whom was *Caonabo*, who  
it has been said, was the chief man in all  
the island, and that because he was not a  
native of it, but of the *Caribbees*, and there-  
fore that lady was content to go into *Spain*  
with the admiral. He having furnished

himself with bread, wood and water, set  
sail on *Wednesday* the 20th of *April* from  
*Guadalupe*, with the wind very scant, keep-  
ing near the latitude of 22 degrees; for at  
that time they had not found out the me-  
thod of running away north to meet the  
south-west winds.

Having made but little way, and the  
ships being full of people, on the 20th of  
*May*, they all begun to be much afflicted  
for want of provisions, which was so great,  
that they had but six ounces of bread a day  
for each, and less than a pint of water, with-  
out any thing else. And though there  
were eight or nine pilots in those two ships,  
yet none of them knew where they were,  
but the admiral was confident they were

Great  
want of  
Provision.

but a little west of the *Azores*, whereof he gives an account in his journal thus.

This morning the *Dutch* compasses varied as they used to do, a point; and those of *Genoa*, that used to agree with them, varied but a very little, but afterwards sailing east vary more, which is a sign we are 100 leagues, or some what more, west of the *Azores*; for when we were just 100, there were but a few scatter'd weeds in the sea; and the *Dutch* needles varied a point, those of *Genoa* cutting the north-point; and when we are somewhat farther E. N. E. they will alter again; which was verified on Sunday following being the 22d of May; by which, and the exactness of his account, he found he was 100 leagues from the islands *Azores*, which he was surprized at, and assigned this difference to the several sorts of load-stones the needles are made by; for till they come just to that longitude, they all varied a point, and there some held it; and those of *Genoa* exactly cut the north-star. The same was yet farther demonstrated the next day, being the 24th of May. Thus continuing their voyage, though all the pilots went like blind men, on *Wednesday* the 8th of June, they came in sight of *Odemira*,

between *Lisbon* and cape *St. Vincent*, all the pilots for several days having still made for the land, except the admiral, who the night before slack'd his sails for fear of land, saying, he did so because they were near cape *St. Vincent*, which all laugh'd at; some of them affirming they were in the *English* channel, and those that erred least, said, they were on the coast of *Galicia*, and therefore ought not to take in any sail, it being better to die ashore than starve miserably at sea, the scarcity being so great, that there were many, who like the *Camibals*, were for eating the *Indians* they had aboard; and others, to save the little provision there was left, were for throwing them overboard, which they would have done, had not the admiral used all his authority to prevent it, considering they were human creatures, and therefore ought not to be worse used than the rest, and so it pleased God to reward him with the sight of land next morning, as he had promised them all, for which reason he was afterwards looked upon by the seamen as most expert, and almost prophetic in sea affairs.

#### C H A P. LXV.

*How the admiral went to court, and their catholic majesties set him out again for the Indies.*

THE admiral being landed in *Spain*, began to prepare for his journey to *Burgos*, where he was favourably received by their catholic majesties, who were there celebrating the nuptials of prince *John* their son, who married *Margaret* of *Austria*, daughter to *Maximilian* the emperor, who was conducted into *Spain*, and received by most of the nobility, and the greatest appearance of persons of quality that had ever been seen together in *Spain*: But tho' I was present as page to prince *John*, I shall not mention the particulars of this solemnity, as well because it does not belong to our history, as because their highnesses historiographers have doubtless taken care to do it. Therefore to return to what concerns the admiral, I say, that being come to *Burgos*, he presented their majesties with several things he brought as samples from the *Indies*, as well birds and beasts, as trees, plants, instruments and other things the *Indians* use for their service and diversion; also several girdles and masks, with eyes and ears of plates of gold, besides much gold sand, grofs and small, as nature produced it: Some grains as big as vetches, some as beans, and some as pigeons eggs.

*Presented to  
the king  
and queen.*

This was not afterwards so much valued, because in progress of time, there were pieces of gold found that weigh'd above thirty pounds. Yet at this time what he brought was much valued, in hopes of what was hoped for, and accordingly their majesties received it in good part. When the admiral had given them an account of all that related to the improving and peopling the *Indies*; he was desirous to return with speed, for fear some disaster should happen in his absence, especially because he had left the people there in great want of all necessaries. Tho' he press'd hard on this account, yet the affairs of that court being subject to delays, he could not be so soon dispatch'd, but that ten or twelve months elapsed before he obtain'd two ships, which were sent before with succours under the command of *Peter Fernandez Coronel*. These set out in *February* 1498. and the admiral stay'd to negotiate the obtaining such a fleet as was requisite for him to return to the *Indies*. But he was forced to stay above a year at *Burgos* and at *Medina del campo*, where in the year 1499. their catholic majesties granted him many favours, and gave the necessary orders for his

his affairs, and for the government, and  
settling of the Indies. Whereof I here  
make mention, that it may appear how  
ready their catholic majesties were as yet  
to reward his merits and service, and how  
much they afterwards alter'd through the  
false informations of malicious and envious  
persons, insomuch as to suffer the wrongs  
to be done him, which we shall give an ac-  
count of hereafter. But to return to his  
departure from court to *Sevil*, there the  
sitting out of the fleet was retarded much  
longer than was convenient, through the  
negligence and ill-management of the king's  
officers, and particularly of *D. John de Fon-*

*seca*, arch-deacon of *Sevil*. Whence it pro-  
ceeded, that the said *D. John*, who was af-  
terwards bishop of *Burgos*, ever was an in-  
ter enemy to the admiral and his affairs,  
and was chief of those that brought him  
into disgrace with their catholic majes-  
ties. And to the end that *D. James* my  
brother and I, who had served as pages  
to prince *John*, who was now dead, might  
not suffer by his delays, nor be absent from  
court, till the time of his departure; he  
sent us on the 2d of November 1497, from  
*Sevil*, to serve still as pages to her majesty  
queen *Ishabel* or *Elizabeth* of glorious me-  
mory.

# CHAP. LXVI.

*The admiral sets out from Spain to discover the continent of Paria.*

THE admiral forwarding his expedi-  
tion with all possible care, on the  
30th of May 1498, set sail from the bay of  
*St. Lucar de Berrameda*, with six ships load-  
ed with provisions and other necessaries for  
the relief of the planters in *Hispaniola*, and  
peopling of that island.

On the 7th of June he arrived at the  
island of *Puerto Santo*, where he heard mass,  
and staid to take in wood and water, and  
what else he stood in need of; yet that  
same night sailed away towards *Madera*,  
whither he came on Sunday the 9th of June,  
and there at the town of *Foncal*, was cour-  
teously received and treated by the gover-  
nor of that island, with whom he staid to  
provide himself farther till Saturday in the  
afternoon, when he sail'd, and on Wednes-  
day the 19th of June arrived at *Gomera*,  
where there was a French ship that had  
taken three Spaniards; who seeing the ad-  
miral's squadron, weigh'd and stood to sea  
with them. The admiral supposing they  
had been merchant ships, and fled, believ-  
ing him to be a Frenchman, took no care  
to pursue, till when they were at a great  
distance, he was inform'd what they were,  
and sent after them three of his ships; for  
fear of which the French left one of the  
ships they had taken, and fled with the  
other two, so that the admiral could not  
fetch them up. They might have carried  
the other off too, had they not forsaken it;  
for when the admiral appeared in the port,  
in the confirmation they were in, they had  
not time to man it; so that there being but  
four Frenchmen aboard, and six Spaniards  
of those that had been taken in it; these  
seeing the assistance coming to them, clapt  
the French under hatches, and return'd to  
the port, where the ship was restored to

But he was for-  
t Burgos and at  
n the year 1499.  
anted him many  
ssary orders for  
his

its master; and the French had suffer'd, but  
that *D. Alvaro de Lugo* the governor, and all  
the island interceded for them, who beg'd  
them to exchange for six of their men the  
French had carried away, which the admiral  
granted. Still hastening on his way,  
he sailed for the island *Ferro* on Thursday  
the 21st of June. There he resolv'd to  
send away three of his six ships to *Hispa-  
niola*, and to sail away with the rest to-  
wards the islands of *Cabo Verde*; thence to  
sail directly over, and discover the contin-  
ent. He therefore appointed a captain  
over each ship, of those he sent to *Hispa-  
niola*, one of which was *Peter de Arana*,  
cousin to that *Arana* who died in *Hispanio-  
la*, the 2d *Alonso Sanchez de Carvagal*, and  
the third one *John Antony Columbus* his own  
kinsman, to whom he gave particular in-  
struction, that each of them should com-  
mand a week in his turn. This done, he  
set out for the islands of *Cabo Verde*, and  
those captains for *Hispaniola*. But that cli-  
mate he was then entering upon being un-  
healthy at that time, he had a terrible fit  
of the gout in one leg, and four days after  
he fell into a violent fever; yet notwith-  
standing his sickness, he was still himself,  
and diligently observed the way the ship  
made, the alterations of the weather that  
happened, as he had done since his first  
voyage.

Islands of  
Cabo  
Verde.

On Wednesday the 25th of June, he dis-  
covered the island *de Sal*, one of those of  
*Capo Verde*, passing by it, he came to an-  
other called *Boa Vista*, a name remote from  
the truth, for it signifies a good sight, and  
the place is dull and wretched. Here he  
cast anchor in a channel near a small island  
on the west-side of it, near to where there  
are six or seven houses of the inhabitants

Boa Vista,

for persons troubled with the leprosy, who came thither to be cured. And as sailors rejoyce when they discover land, so do these wretches much more, when they see any ships. Therefore they presently ran down to the shore, to speak to those the admiral sent ashore in the boats to take in water and salt, there being also abundance of goats there. Understanding they were *Spaniards*, the *Portuguese*, who had charge of the island for the owner, went aboard to speak to the admiral, and offer him all he demanded; for which the admiral thanked him, ordered him to be well treated, and some provision given him, because by reason of the barrenness of the island, they always live miserably. The admiral being desirous to know what method they used to cure the lepers; that man told him, that the temperature of the air was one main cause of it; and the next was their diet, because there came thither a vast number of tortoises, on which the sick feed, and anoint themselves with their blood, and continuing it a short time they recover; but that those who are born infected with this distemper are longer a curing. That the reason of having so many *Tortoises*, was the shores being all sandy, whither the tortoises, in the months of *June*, *July* and *August*, came over from the shore of *Africk*, most of them as big as an ordinary target, and that every night they came up to sleep and lay their eggs on the sand; that the people went along the shore in the night with lanterns or other light, seeking the track the tortoise leaves on the sand, which they follow till they find the fish; which being tired with coming so far, sleeps so sound, that it hears not its enemy. He having found and turned his belly up, without doing it any more harm, goes on to seek more; for when turn'd, they cannot stir from the place, or recover their feet. Having got as many as they think fit, they

Tortoises  
have  
caught.

come again in the morning to chase those they like best; and letting go the least, carry away the others to eat. So wretchedly do the sick live, without any other employment or sustenance, the island being very dry and barren, without trees or springs, so that they drink of certain wells whose water is thick and brackish. Those who had charge of the island, which were only that man and four more, had no other employment but only to kill goats and salt them to send into *Portugal*. He said, there were such multitudes of these goats on the mountains, that some years they killed to the value of three or four thousand ducats, and that they all came from eight goats, carried thither by the proprietor of the island, whose name was *Roderick Afonso*, the king of *Portugal's* secretary of the customs. That very often the hunters are four or five months without bread, or any other thing to eat, except goats flesh and fish; for which reason he made great account of the provision he had given him. That man and his companions, with some of the admiral's men, went out a goat-hunting; but perceiving it required much time to kill all he had need of, he would stay no longer being in great haste.

On *Saturday* the 30 of *June*, he sailed for the island of *Santiago*, the chief of *Cabo Verde*, where he arrived the next day in the evening, and anchored near a church, sending ashore to buy some cows and bulls to carry alive to *Hispaniola*: yet observing it was a difficult matter to furnish himself so soon as he desired, and how prejudicial delays were to him, he resolved to stay no longer; and the more for fear his men should sicken, that country being unhealthy. He says, that all the while he was at that island, he never saw the sky nor any star; but there was always a thick hot fog, inasmuch that three parts of the inhabitants were sick, and they all of them had a bafe colour.

Santiago  
island.

#### C H A P. LXVII.

*How the admiral sailed from the islands of Cabo Verde, to discover the continent; of the violent heat he endured, and great brightness of the North-Star.*

ON *Thursday* the 5th of *July*, the admiral left the island of *Santiago*, sailing south west, with a resolution to hold that course till he was under the equinoctial, and then to steer due-west, that he might find some other land, or cross over to *Hispaniola*. But the currents among those islands setting violently towards the north and north west, he could not fail as he designed; so that he says, on *Saturday* the 7th of *July*, he was still in sight of the island of *Fogo*,

Fogo  
island.

go, which is one of those of *Cabo Verde*; which he says, is very high land on the south-side; and at a distance, looks like a great church, with a steeple at the east end, which is a vast high rock; whence before the east winds blow, there usually breaks out much fire; as is seen at *Tenerif*, *Vesuvius* and mount *Ætna*. From this last country of christians he held on his course south west, till he came into only 5 degrees of north latitude, where he was becalmed, Having

having been till then continually attended by the fog we mentioned above. The calm lasted eight days, with such violent heat, that it almost burnt the ships; and there was no man could abide under deck, and had it not rained sometimes, and the sun been clouded, he thought they would have been burnt alive together with the ships; for the first day of the calm, which was fair, the heat was so violent, that nothing could withstand it, had not God miraculously relieved them with the aforesaid rain and fog. Having therefore got off a little to the northward, into seven degrees of latitude, he resolved not to make any more to the south, but sail due-west, at least till he saw how the weather settled; because he had lost many cask with the great heat, the hoops flew, and the corn and all provisions were scorched up. About the middle of July, he says, he very carefully took the latitude, and found a wonderful difference between that and the parallel of the *Azores*. For there, when the *Charles's Wain* was on the right, that is, east, then the *North-Star* was lowest, and from that time began to rise; so that when the *Charles's Wain* was over thead the *North-Star* was two degrees and an half higher, and being once passed that, began again to descend, the same five degrees it ascended. This, he says, he observed several times very carefully, the weather being very fit for that purpose. But that where he was at this time in the torrid zone,

Martine  
circati-  
on,

Santiago  
island.

it happened quite contrary; for when the *Charles's Wain* was in its greatest elevation, he found the *North-Star* six degrees high, and when the *Charles's Wain* came to the west, in six hours space he found the *North-Star* eleven degrees high; and then in the morning, when the *Charles's Wain* was quite depressed, though it could not be seen because of the inclination of the pole, the *North-Star* was six degrees high, so that the difference was ten degrees, and it made a circle, whose diameter was ten degrees, whereas in the other place it made but five lowering the position; for there it is lowest when the other is west, and here when in its elevation. The reason of it he thought very difficult to comprehend, and not being completely master of it, without farther reflexions on it, he says, he is of opinion, that in what relates to the circumference of the stars orb, it may be said, that at the equinoctial the full appears, and the nearer a man goes to the pole it seems the less, because the heaven is more oblique. As for the variation, I believe the star has the quality of all the four quarters, as has the needle, which if touched to the east-side points to the east, and so of the west, north, and south; and therefore he that makes the compass, covers the load-stone with a cloth, all but the north part of it, viz. that which has the virtue to make the steel point north.

*How the admiral discovered the island of the Trinity, and saw the continent.*

ON Tuesday the last day of July, 1498. the admiral having sailed many days west, infomuch, that in his judgment, the *Caribbee* islands were north of him, he resolved not to hold that course any longer, but to make for *Hispaniola*, not only because he was in great want of water, but also because all his provisions perished, and he was afraid lest during his absence some mutiny or disorder had happened among the people he left there, as in effect there had, as we shall show hereafter. Therefore altering his course from the west, he stood north, thinking to light on some of the *Caribbee* islands, there to refresh his men, and take in wood and water, whereof he had great want.

Trinity  
island dis-  
covered.

As he was thus sailing one day about noon, *Alonso Perez Norando*, a sailor of the town of *Gulfoa*, going up to the round-top, saw land to the westward at about fifteen leagues distance, and there appeared three mountains all at the same time,

but not long after they perceived the same land stretched out towards the north-east, as far as the eye could reach, and that did not seem to be the end. Having given thanks to God, said the *Salve Regina*, and other prayers, the seamen use in time of distress or joy; the admiral called that land the island of the *Trinity*, as well because he had before thoughts of giving that name to the first land that he found, as in return, because it had pleased God to show him three mountains all together, as has been said. He sailed due-west, to make a cape that appeared to the south of him, and making for the south-side of the island, till he came to an anchor, five leagues beyond a point, which he called *de la Galera*, or of the galley, because of a rock that lay near the point, and at a distance look'd like a galley under sail. Having now but one cask of water for all his ships crew, and the other ships being in the same condition, there being no conveniency here to take

## The first Discovery of

take in any, on *Wednesday* following in the morning he continued his course still west, and cast anchor at another point, which he called *de la Plaga*, or, of the strand, where the people landed, and took water, in a delicate brook, without seeing any town or people there, tho' along the coast they left behind they had seen many houses and towns. True it is, they found the tokens of fishermen, who had fled, leaving behind them some of their fishing tackle. They also saw the prints of the feet of beasts, which seem'd to be of goats, and saw the bones of one, but the head being without horns, they thought it might be of some catamountain, or monkey, as they afterwards found it to be, seeing abundance of those cats in *Paria*. This same day, being the first of *August*, sailing between cape *Galera* and that of *la*

*Plaga* southwards, they discovered the continent, about twenty five leagues distance, as they guessed; but they thinking it another island, called it *Isla Santa*, or Holy Island. The land they saw of the *Trinity*, between the two points, was thirty leagues in length east and west, without any harbour, but all the country very pleasant with trees down to the sea, and abundance of towns. This space they ran in a very short time, because the current of the sea set so very violent westward, that it looked like a rapid river both day and night, and at all hours, notwithstanding the tide flow'd and ebb'd along the shore above forty paces, as happens at *St. Lucar de Barrameda*, when there are floods; for though the water rise and fall never so much, yet it never ceases running towards the sea.

### C H A P. LXIX.

*How the admiral sailed to the cape, called Puntal del Arenal, and a canoe came out to talk to him.*

Perceiving they could have no account of the people of the country at this cape, and that there was no conveniency of taking water, without excessive labour, and there was no conveniency of careening the ships and getting provisions, the next being the second of *August*, the admiral went on to another point of land, which seemed to be most westerly in that island, and called it *del Arenal*, where he came to an anchor, thinking the easterly winds which reign there would not be so troublesome to the boats in going backwards and forwards. On the way before they came to this point, a canoe began to follow them with twenty five men in it, and stopped at about a cannon-shot distance, calling out and talking very loud. Nothing could be understood, though it was supposed they enquired who our men were, and whence they came, as the other *Indians* used to do at first: there being no possibility of persuading them with any words to come aboard, they began to show them several things, that they might covet to have them, such as little bras basons, looking-glasses, and other things, the rest of the *Indians* used to make great account of. But tho' this drew them a little, yet

they soon stopped again, and therefore the more to allure them, the admiral ordered one to get upon the poop with a taber and pipe, and some young fellows to dance. As soon as the *Indians* saw it, they put themselves into a posture of defence, laying hold of their targets, and shooting their arrows at those that danced, who by the admirals command, that those people might not go unpunished, or condemn the christians, leaving their dance began to shoot with their cross bows, so that they were glad to draw off, and made to another caraval, clapping close to its side without any apprehension. The pilot of the ship went over into the canoe and gave them some things they were very well pleased with, and said, if they had been ashore they would have brought him bread from their houses, and so they went towards land, nor would they in the ship stop e'er a one, for fear of displeasing the admiral. The account they gave of them, was, that they were well shaped people, and whiter than those of the other islands, and that they wear their hair long, like women, bound with small strings, and covered their privities with little clouts.

## CHAP. LXX.

*Of the danger the ships were in, entering the mouth of the channel, they called Boca del Drago, or, the Dragon's Mouth; and how Paria was discovered, being the first discovery on the continent.*

AS soon as the ships had anchored at Punta del Arenal, the admiral sent the boats ashore for water, and to get some information of the Indians, but they could do neither, that country being very low, and unpeopled. He therefore ordered them the next day to dig trenches on the island, and by good luck they found them ready made and full of excellent water, and it was thought the fishermen had made them. Having taken what they wanted, the admiral resolved to proceed on to another mouth or channel which appeared towards the north-west, which he afterwards called Boca del Drago, or, the Dragon's Mouth, to distinguish it from that where he was, to which he had given the name of Boca de la Serpe, or, the Serpent's Mouth. These two mouths or channels, like the Dardanelles, were made by the two westernmost points of the Trinity island, and two others of the continent, and lay almost north and south of one another. In the midst of that, where the admiral anchored, was another rock, which he called El Gallo, that is the Cock. Through this mouth, he called Boca de Serpe, the water continually ran so furiously northward, as if it had been the mouth of some great river, which was the reason of giving it that name, because of the fright it put them into. For as they

lay very securely at anchor, there came a stronger stream of water than usual, with a hideous noise, running through that mouth northward. And another current running out of the gulph now called Paria, opposite to that before-mentioned, they met with hideous roaring, and caused the sea to swell up like a high mountain, or ridge of hills along that channel, which mountain soon came towards the ships to the great terror of all men fearing they should over-set. But it pleased God it passed under, or rather lifted them up without doing any harm, though it drew the anchor of one of them, carrying the vessel away, but by the help of their sails they escaped the danger, not without mortal fear of being lost. That furious current being passed, the admiral considering the danger he was in there, stood for the Dragon's Mouth, which was between the north point of the Trinity island, and the east point of Paria; yet went not through it at that time, but sailed along the south coast of Paria westward, believing it to be an island, and hoping to find a way out, northwards towards Hispaniola. And though there were many ports along that coast of Paria, he would put into none, all the sea being a harbour locked in with the continent.

*The gulph of Paria.*

*A wonderful swelling of water.*

## CHAP. LXXI.

*How there was some gold and pearls found in Paria, and a people of good conversation.*

THE admiral being at an anchor on the Fifth of August, and it being his particular devotion never to weigh on a Sunday, he sent the boats ashore, where they found abundance of fruit of the same sort they had seen in the other islands; great numbers of trees, and signs of people that had fled for fear of the christians. But being unwilling to lose time, he sailed down the coast fifteen leagues farther without going into any harbour, for fear he should miss of wind to bring him out. Being at an anchor on the coast, at the end of these fifteen leagues, there came out a canoe to the caravel called El Borreo, with three men in it, and the pilot knowing how much the admiral coveted to receive some information from those people, he pretended to

talk to them, and let himself fall into the canoe, and the Spaniards in the boat took those three men, and carried them to the admiral, who made very much of them, and sent them ashore with many gifts, where there appeared abundance of Indians. These hearing the good account the three gave them, came all in their canoes to barter, for such things as they had, which were much the same, as had been seen in the islands before discovered, only that here they had no targets, nor poisoned arrows, which these people do not use, but only the Canibals. Their drink was a sort of liquor as white as milk, and another somewhat blackish, tasting like green wine made of grapes not quite ripe, but they could not learn what fruit it was made of. They wore cotton cloths

well

## The first Discovery of

well wove, of several colours, about the bigness of a handkerchief, some bigger and some less; and what they most valued of our things, was brass, and especially bells. The people seem to be more civilized and tractable than those of *Hipaniola*. They cover their nakedness with one of those cloths above-mentioned, and have another wrapped about their head. The women cover nothing, nor even their privities; the same they do in the *Trinity* island. They saw nothing of value here, except some little plates of gold they hung about their necks; for which reason, and because the admiral could not stay to dive into the secrets of the country, he ordered six of those *Indians* to be taken, and continued his voyage westward, believing that land of *Paria*, which he called the *Holy Island*, was no continent. Soon after another island appeared towards the south, and another no less than that towards the west, all high land, sowed and well peopled; and the *Indians* had more plates of gold about their necks than the others, and abundance of *Guaniis*, which is very low gold. They said that was produced in other western islands inhabited by people that eat men. The women had strings of beads about their arms,

and among them very fine large and small pearls strung, some whereof were got in exchange to send their catholic majesties as a sample. Being asked where they found those things, they made signs to show that in the oyster-shells which were taken westward of that land of *Paria*, and beyond it towards the north. Upon this, the admiral staid there to know more of that good discovery, and sent the boats ashore, where all the people of the country that had flocked together, appeared so tractable and friendly, that they importuned the christians to go along with them to a house not far off, where they gave them to eat, and a great deal of that wine of theirs. Then from that house, which it is likely was the king's palace, they carried them to another, which was his sons, and shewed them the same kindness. They were all in general whiter than any they had seen in the *Indies*, and of better aspects and shapes, with their hair cut short by their ears, after the *Spanish* fashion. From them they understood that land was called *Paria*, and that they would be glad to be in amity with the christians. Thus they departed from them, and returned to the ships.

### C H A P. LXXII.

*How the admiral passed through Boca del Drago, and the danger he was in there.*

THE admiral holding on his voyage westward, they still found less and less water, inasmuch that being come through four or five fathom, they found but two and a half at ebb, for the tide differed from that at the *Trinity* island; for at the *Trinity*, the water swelled three fathom, and here being forty five leagues to the westward, it rose but one; and there always, whether ebb or flood, the current ran west; and here upon the ebb they ran east, and upon the flood west; there the water was but brackish, here it was like river water. The admiral perceiving this difference, and how little water he found, durst proceed no farther in his ship, which required three fathom water, being of a hundred ton, and therefore came to an anchor on that coast, which was very safe, being a port like a horseshoe, locked with that land on all sides. However, he sent the little caraval, called *El Boreo*, or the post, to discover whether there was any pass westward among those islands. She having gone but a little way, returned the next day, being the eleventh of *August*, saying, that at the westernmost point of that sea, there was a mouth or opening, two leagues over from north

to south, and within it a round bay, with four other little bays, one towards each quarter of heaven, that from each of them flowed a river, whose water made that sea so sweet, which was yet much sweeter farther in, adding, that all that land which seemed to be islands, was one and the same continent; that they had every where four or five fathom water, and such abundance of those weeds they saw in the ocean, that they hindered their sailing. The admiral therefore being certain he could not get out westward, that same day stood back to the eastward, designing to pass the straits, which he saw between the land the *Indians* call *Paria*, and the *Trinity*. In this strait there are four little isthms east near the point of the *Trinity*, which he called cape *Boca*, because it was blunt, west upon the point of the continent, which he called cape *Lapa*, and in the middle. The reason why he called this the *Dragon's Mouth*, was, because it is very dangerous, by reason of the abundance of fresh water that struggles to get out there into the sea, and made three boisterous channels, extending from east to west the width of the strait. And because as he was sailing through, the wind failed

failed him, and he was in danger of being drove on fome fand or rock; therefore he with reafon gave it a name answerable to that of the other mouth, where he was in no lefs danger as was faid above. But it pleas'd God, that what they moft dreaded fhould be their greateft fafety, the ftrength of the current carrying them off. Therefore on *Monday* the 17th of *Auguft*, he began to fail westward along the coaft of *Paria*, in order to ftand over afterwards for *Hifpaniola*, giving thanks to God, who deliver'd him from fo many troubles and dan-

gers, ftill fhowing him new countries full of peaceable people and great wealth, efpecially that, which he certainly concluded to be the continent, becaufe of the great extent of that gulph of pearls, of the rivers that ran from it, of the fea, which was all fweet water; and by the authority of *Eſdras*, in the 8th chapter of the 4th book; where he fays, that dividing the globe into feven parts only, one of them is covered with water; for all the *Indians* of the *Caribbee* iflands have told him, there was a vaft land fouthward.

## C H A P. LXXIII.

*How the admiral flood over from the continent to Hispaniola.*

THE admiral failing along westward on the coaft of *Paria*, ftill fell farther off from it towards the north weft, the currents in being calm driving him that way; fo that on *Wednesday* the 15th of *Auguft*, he left the cape, he called *de las Conchas*, or of fhells, fouth of him, and the ifland *Margarita* weft, which name he gave this ifland, perhaps by divine infpiration, becaufe clofe by it lies that of *Cubagua*, where an infinite quantity of pearls has been found; and in *Hifpaniola* and *Jamaica* at his return he called fome *Mountains of Gold*, where afterwards was found the greateft quantity and largeft pieces that ever were carried from thence into *Spain*. But to return to his voyage, he held on his courfe by fix iflands, which he called *las Guardas*, or the guards, and three others more to the north, *los Teſtigos*, or the witneſſes. And though they ftill difcover'd much land of *Paria* weftward, yet the admiral fays, he could not from this time give fuch an account of it as he would wifh, becaufe through or ermuch watching, his eyes were inflam'd, and therefore was forced to take moft of his obfervations from the failors and pilots. He alfo fays, that this

return, and of being speedily relieved : But the first year being pass'd, the *Spanish* provisions failing, and sickness and sufferings increasing, they began to be dissatisfied with what was, and to despair of any better ; so that the complaints of many discontented persons were heard, who never want some body to stir them up, desiring to be head of a party, as was now done by one *Francis Roldan*, born at *Torre de D. Ximeno*, whom the admiral had left in such power among both *Christians* and *Indians*, by making him chief justice, that he was as much obey'd as himself. For this reason it is to be suppos'd there was not that good understanding between him and the admiral's lieutenant, as ought to have been for the publick good, as time and experience made it appear. For the admiral, neither returning himself, nor sending any supplies, this *Roldan* began to think of possessing himself of the island, designing for this purpose to murder the admiral's brothers, as those that could best oppose his rebellion, and waited an opportunity to put this in execution. It happened that the lieutenant of the island, one of the admiral's brothers, went to a province in the west, called *Xaragua*, 80 leagues from *Isabella*, where the said *Roldan* remained in his employ, but subordinate to *D. James*, second brother to the admiral. This *Roldan* was so offended at, that whilst the lieutenant was taking order how the king of the island should pay tribute to their catholic majesties, as the admiral had rated all the *Indians*, *Orlando* began underhand to draw some of them over to his party. But that it might not prove fatal to rise on a sudden, and without some pretence : that which *Roldan* laid hold of was, that there was a caraval ashore at *Isabella*, built by the lieutenant of the island, to send to *Spain* in case of necessity, and there being no launching of it for want of tackle and other necessities, *Roldan* feign'd and gave out there was some other reason for it, and that it behov'd the publick, that caraval should be fitted out, that some of them might go to *Spain* in it, to give an account of their sufferings. Thus upon pretence of the publick good, he pers'd that it might be launch'd, and *D. James Columbus* not consenting to it for want of

tackle, as has been said, *Roldan* began more boldly to treat with some about launching the caraval in despite of him ; telling those, he thought to agree with him, that if the lieutenant, and *D. James* were disspleas'd at it, the reason was because they would secure to themselves the dominion of the country, and keep them in subjection, without any ship that might carry the news of their revolt to their catholic majesties. And since they were satisfied and convinced of the cruelty and ill-nature of the lieutenant, and what a restless life he led them, building towns and forts, and that they had no hopes of the admiral's coming with supplies, it was fit they should take that caraval and procure their liberty, and not suffer themselves under pretence of pay, which they never receiv'd, to be kept under by a foreigner, whereas it was in their power to live at ease and in plenty ; for that whatsoever could be had in the island would be equally divided among them, and they would be serv'd by the *Indians* to their own content, without being so much in subjection, that they could not take to wife any *Indian* woman they pleas'd. That the lieutenant made them keep the three vows of religious men ; and besides that, they wanted not for fasts and disciplines, as also imprisonment, and other punishments, which they endured for the least fault. Therefore, since he had the rod of justice and regal authority, which secured them against any thing that might befall them on this account, he advis'd them to do what he directed, wherein they could not do amiss. With these and the like words, proceeding from the hatred he bore the lieutenant, he drew so many over to his own party, that one day when the lieutenant was come back from *Xaragua* to *Isabella*, some of them resolv'd to stab him, looking upon it as so easy a matter, that they had provided a halter to hang him up after he was dead. What at present the more incens'd them, was the imprisoning of one *Barabona*, a friend to the conspirators, against whom, if God had not put it into the heart of the lieutenant not to proceed to execution of justice at that time, they had then certainly murdered him.

conveniently for his design, that he was near the said town; for whilst the lieutenant was abroad, he had been sent with 40 men about that province, to reduce the Indians that had revolted, with the same design of making themselves masters of that town, and destroying the christians. So that Roldan, under pretence of putting a stop to this evil, and punishing the Indians, gather'd his men at the residence of one of their Caciques, call'd Marche, designing to put his project in execution upon the first opportunity. But Ballester the commander of the fort, having some jealousy of him, he stood upon his guard, and acquainted the lieutenant of the island with the danger he was in, who with all speed, and what men he could gather, threw himself into the fort. Thither Roldan came upon a safe conduct, now his conspiracy was discovered, rather to observe by the lieutenant what might do him harm, than through any desire of coming to an accommodation, and with more boldness and impudence than became him, required the lieutenant to cause the caraval to be launched, or give him leave to launch it, which he and his friends would do. The lieutenant incensed at these words, answered, that neither he nor his friends were seamen, or knew what was proper to be done in that case; and that though they had known how to launch it, yet they could not fail in her for want of rigging, and other necessities, and therefore it would be only exposing the men and the caraval. And, forasmuch as the lieutenant understood that affair, as a seaman, and they not being such, knew nothing of it, therefore they varied in their judgments. These and other displeasing words having pass'd between them, Roldan went away in a passion, refusing to quit his rod of justice, or stand trial, as the lieutenant ordered, saying he would do both, when their majesties, whose the island was, commanded him; knowing he could expect no justice from him, because of the hatred he bore him, but that right or wrong he would find means to put him to death with shame: that in the mean while, not to exceed the bounds of reason, he would go and reside where he should bid him. But he at present appointing him the residence of the Cacique, James Columbus, he refused it, saying, there were not provisions there for his men, and that he would find a more convenient place. He set out towards Isabella, and having gathered 65

men, perceiving he could not launch the caraval, he plunder'd the magazines, he and his followers, taking away what arms, stuffs, and provisions they thought fit, D. James Columbus, who was there, not being able to oppose him, but would have been in danger, had he not retired to the fort with some friends and servants. Yet in the process afterwards drawn up on this subject, there were some that depos'd, that Roldan promised to submit to him, provided he would take his part against his own brother: which he refusing, and Roldan not being able to do him any further harm; as also fearing the succours that were coming from the lieutenant, he went out of town with all the mutineers, and falling on the cattle that graz'd thereabouts, they kill'd such as they lik'd to eat, and took the beasts of burthen to serve them in their journey, resolving to go into the province of Xaragha, whence the lieutenant was lately come, designing to settle there, that being the pleasantest and most plentiful part of the island, the people here being more civiliz'd and wiser than the rest of the natives of Hispaniola; but above all, because the women were the handsomest, and of the most pleasing conversation of any others, which most invited them to go thither. But that they might not go without making trial of their strength, before the lieutenant could increase his power, and punish them as they deserv'd, they resolv'd to take the town of the Conception in their way, to surprize it, and kill the lieutenant, and in case this did not succeed, to besiege him. The lieutenant having intelligence of their design, stood upon his guard, encouraging his men with good words, and promising them many gifts, and each of them two slaves. And forasmuch as he understood, that most of those that were with him, lik'd the life Roldan and his men led so well, that many of them gave ear to his messages; therefore Roldan having conceiv'd hopes that they would all go over to him, had the boldness to undertake that enterprise, which did not succeed as he expected. For the lieutenant, having provided as has been said, being himself a man of great resolution, and having the best men on his side, was resolv'd to do that by force of arms, which he could not compass by fair means and arguments. Having therefore gathered his men together, he march'd out of town to attack the rebels on the road.

*How Francis Roldan incens'd the Indians against the lieutenant, and went away with his men to Xaragua.*

**F**Francis Roldan, perceiving he was so disappointed, and that not one of the lieutenants men came over to him, as he had expected, resolv'd to retire in time, and go away to *Xaragua* as he design'd at first, not daring to meet him, yet presum'd to talk contemptibly of him, and to stir up the *Indians*, where-ever he went, to rebel against him, telling them, the cause of his forsaking him was his being a man naturally revengeful and morose, as well towards the *Christians*, as *Indians*; and abominably covetous, imposing great burdens and tributes on them; which if they bore with, he would increase every year, tho' against their catholick majesties will; who requir'd nothing of their subjects but obedience, maintaining them in justice, liberty and peace; which, if they fear'd they should not be able to maintain, he with his friends and followers, would assist them to assert, and would declare himself their protector and deliverer. After which, they resolv'd to forbid paying the tribute, we said had been impos'd on them, by which means it could not be gathered of those that dwelt far from the lieutenant, nor durst he exact it of those near about him for fear of provoking them to join with the rebels. Yet this condescension towards them, had not so good an effect, but that as soon as the lieutenant was gone from the *Conception*, *Guarionex*, who was the principal *Cacique* of that province, with the assistance of *Roldan*, resolv'd to besiege the fort, and destroy the *Christians* that kept it. The better to effect it, he drew together all the *Caciques* of his party, and agreed with them privately, that every one should kill those that were within his precinct, because the territories in *Hispaniola* being too small, for any of them to maintain a great number of people, the *Christians* had been oblig'd to divide themselves into small parcels of eight or nine in each liberty. This gave the *Indians* hopes, that surprizing them all at the same time, they might have it in their power to suffer none to escape. But they having no other way of fixing a time, or or-

*Conspiracy of the Indians to destroy the Spaniards.*

dering any thing else that requires counting, but only by their fingers, they resolv'd, that every one should be ready to destroy the *Christians* at the next full moon. *Guarionex* having thus dispos'd his *Caciques* to put this in execution, the chiefest of them being desirous to gain honour, and looking upon the matter as very easie, and being no good astronomers, to know when the full moon was, fell on before the time appointed, and were forced to fly after many blows. He thinking to find assistance in *Guarionex* found his own ruin; for he put him to death, as he had deserv'd, for having caus'd the conspiracy to be discovered, and the *Christians* to be upon their guard. The rebels were not a little concern'd at this miscarriage; for as was reported, it had been contriv'd with their consent, and therefore they waited to see, whether *Guarionex* brought affairs to such terms, that joining with him they might destroy the lieutenant: But perceiving this did not succeed, they thought not themselves secure in the province where they were, but went away to *Xaragua*, still proclaiming themselves protectors of the *Indians*, whereas they were thieves in their actions and inclinations, having no regard to God or the world, but following their inordinate appetites; for every one stole what he could, and *Roldan* their leader more than all of them, persuading and commanding every *Cacique* to entertain him that could and would defend the *Indians* and rebels from paying the tribute the lieutenant demanded of them, tho' at the same time he under this pretence took much more from them; for from only one *Cacique*, whose name was *Manicacotex*, he received every three months, a calabash, containing three marks of pure gold, that is, a pound and a half, and to be the more sure of him, kept his son and nephew as hostages. He that reads this, must not wonder that we reduce the marks of gold to the measure of a calabash, which we do to show, that the *Indians* in these cases dealt by measure, because they never had any weights.

persons, and desirous to lead that easie life *Roldan* promis'd them, they durst not pu-  
nish the guilty, for fear of being forsaken;  
which made them so insolent, that it was  
impossible to keep them in order, and there-  
fore they were forced to bear with the af-  
fronts of the rebels. But it being God's  
will to afford them some comfort, it pleas'd  
him to order that the two ships should ar-  
rive, which, as was said before, had been sent  
a year after the admiral's departure from the  
*Indies*, not without great application us'd  
by him at court for fitting them out; for he,  
considering the nature of the country, the  
dispositions of the people he left behind,  
and the great danger that might accrue  
from his long absence, press'd for and ob-  
tain'd of their catholick majesties, that those  
two ships might be sent before, of 18 he  
had been ordered to fit out. The arrival  
of these, the supplies they brought of men  
and provisions, and the assurance that the  
admiral was safe arrived in *Spain*, encour-  
aged those that were with the lieutenant to  
serve him more faithfully, and made those  
that followed *Roldan*, apprehensive of be-  
ing punish'd. These being desirous to hear  
news, and furnish themselves with what  
they wanted, resolv'd to repair to *S. Do-*  
*mingo*, where the ships had put in, hoping  
to draw some of the men over to their  
party. But the lieutenant having intelli-  
gence of their march, and being nearer  
that harbour, he mov'd towards them to  
hinder their passage; and having left

The rebels  
obey to  
him.

guards on the passies, went to the port to  
see the ships, and order the affairs of that  
place. And being desirous the admiral  
should find the island in a peaceable condi-  
tion, and all troubles ended, he again made  
new overtures to *Roldan*, who was six  
leagues off with his men, sending to him  
for this purpose the commander of the two  
ships lately arriv'd, whose name was *Peter*  
*Fernandez Coronel*; as well because he was  
a man of worth and in authority, as because  
he hop'd his words would prove more effec-  
tual, since he as an eye witness, could cer-  
tify him of the admiral's arrival in *Spain*,  
the good reception he had found, and the  
willingness their majesties express'd to make  
him still greater. But the chief men among  
them, fearing the impression this messenger  
might make upon their followers, would not  
suffer him to speak in publick; so that they  
received him with their bows and arrows on  
the road, and he could only speak some  
few words to those that were appointed to  
hear him. Thus having done nothing, he  
returned to the town, and the rebels to  
their quarters in *Xaragua*, not without ap-  
prehensions, lest *Roldan* and some of the  
principal men of his gang should write to  
their friends that were with the lieutenant,  
desiring them when the admiral came, to  
intercede for them, since all their complaints  
were against the lieutenant, and not against  
the admiral himself, for which reason they  
desired to be restored to his favour.

#### C H A P. LXXVIII.

*How the three ships the admiral sent from the Canary islands arrived where the rebels were.*

HAVING spoke of the arrival of the two  
ships the admiral sent from *Spain* to  
*Hispaniola*, it is fit we give an account of the  
three that parted from him at the *Canary*  
islands, which proceeded on their voyage  
with fair winds till they came to the *Carib-*  
*bee* islands, which are the first that sailors  
meet with in their way to the port of *S.*  
*Domingo*. The pilots then not being so well  
acquainted with that voyage, as they have  
been since, it happened they knew not how  
to hit that port, and were carried away by  
the currents so far to westward, that they  
arrived in the province of *Xaragua*, where  
the rebels were, who as soon as they under-  
stood that those ships were out of their  
way, and knew nothing of their revolt,  
some of them went peaceably aboard, pre-  
tending they were there by the lieutenant's  
orders, the better to be supplied with pro-  
visions, and keep that country under. But

Exorcise  
of pilots  
carries the  
ship to the  
west of

it being very easie for a secret, that is a-  
mong many, to be discovered, *Alonso San-*  
*cbez de Carvajal*, who was the skilfullest of  
the captains of those ships, being aware of  
the rebellion and discord, began immedi-  
ately to make overtures of peace to *Francis*  
*Roldan*, thinking to bring him to submit to  
the lieutenant. But the familiar conversa-  
tion the rebels had before entertain'd aboard  
the ships, was the cause that his persuasions  
had not the desired effect; for *Roldan* had  
privately obtain'd promises from many of  
those that came fresh out of *Spain*, that they  
would stay with him, and by that accession  
he hoped to become still greater. *Carvajal*  
therefore finding things were not in such a  
posture, that he might hope for a speedy  
conclusion of what he had in hand, thought  
it convenient, with the advice of the other  
two captains, that the people they brought  
under pay to work in the mines, and other  
employ-

*With men  
deject to  
the rebels.*

employments, should go by land to *S. Domingo*, because the winds and currents being set there against that voyage, it was possible they might not perform it in two or three months; so that they would not only consume the provisions, but the men might fall sick, and the time be lost, which ought to have been employed in the service they came for. Having agreed upon this, it fell to *John Anthony Columbus* his lot to march with the men, which were 40, to *Arana* to sail about with the ships, and to *Carvajal* to stay and endeavour to bring the rebels to an accommodation. *John Anthony Columbus* setting forward the 2d day after they landed, those labourers and vagabonds sent over to work, went away to the rebels, leaving their captain with only six or seven men that stuck to him. He seeing their base infidelity, without apprehending any danger, went to *Roldan*, and told him, That since he pretended to promote the service of their catholic majesties, it was not reasonable he should suffer those men, that were come to people and cultivate the country, and to follow their callings with wages in hand, to stay there and lose their time, without doing any thing of that they were obliged to; and that if he had turn'd

them away, it had been a token that his words and his actions agreed; that his staying there caused the division and disorder with the lieutenant, and not any inclination in him to obstruct the king's service. But that which had happened turning to the account of *Roldan* and his followers, as well for the carrying on their design, as because the crime committed by many is generally soonest conniv'd at; he excus'd himself as to that point, saying, He could not use violence towards them, and that his was a religious order, which refused no man. *John Anthony* knowing it was not the part of a discreet man to expose himself to the danger of pressing farther without hopes of success, resolv'd to go aboard again with those few that follow'd him; and therefore that they might not be serv'd so by those that were left, they two captains sail'd immediately with their two ships towards *S. Domingo*, with the wind as contrary as they had fear'd; for they spent many days, spoil'd their provisions, and *Carvajal's* ship was much damaged upon certain sands, where she lost her rudder, and sprung a leak, so that they had much to do to bring her in.

#### CHAP. LXXIX.

*How the captains of the ships that came from Xaragua, found the admiral at S. Domingo.*

*The admiral  
endeavouring  
to reduce the  
rebels.*

THE captains with their ships, arriving at *S. Domingo*, in their return from *Xaragua*, found the admiral there, after his discovery of the continent. He being fully inform'd of the condition of the rebels, and having seen the process his lieutenant had made against them, tho' the crime was plainly made out to deserve severe punishment, yet he thought fit to form a new process, and give their majesties an account of it, resolving at the same time to use all the moderation he could in this matter, and endeavouring to reduce them by fair means. For which reason, and that neither they nor any others, might have cause to complain of him, or say, he kept them there by force, he made proclamation on the 12th of *September*, giving leave to all that would return to *Spain*, and promising them free passage and provisions. And being inform'd on the other hand, That *Roldan* was coming towards *S. Domingo* with some of his men, he ordered *Michael Ballester*, commander of the *Conception*, to secure his own town and fort; and in case *Roldan* came that way, he should tell him from the admiral, that he was

much concerned at his sufferings, and all that was past, and would have no more said of it, granting a general pardon to all, and desiring him to come away immediately to the admiral, without fearing any thing, that by his advice things might be ordered, as was for their majesties service; and if he required any safe conduct, he would send it him in such form as he required. *Ballester* return'd answer on the 14th of *February*, That he had received certain information, that *Riquelme* was the day before come to the town of *Bonao*, and that *Adrian* and *Roldan*, who were the ring-leaders, would meet there in seven or eight days, at which time he might there apprehend them, as he did. For having discours'd them according to the instructions given him, he found them obstinate and unmannerly. *Roldan* telling him, They were not come to treat, nor did they desire, or care for peace, for he had the admiral and his authority at his beck, either to support, or suppress it, as he pleas'd; and that they must not talk to him of any accommodation, till they had sent him all the *Indians* taken at the siege of the *Conception*, since they had met together

together to serve the king, and upon his promise of security. Other things he added, by which it appeared, he would make no agreement, but what was much to his advantage. To this purpose he demanded, that the admiral should send *Caravajal* to him, because he would treat with no other but him, he being a man that would hear reason, and had discretion, as he had found by experience, when the three ships, as has been said, were at *Xaragua*. This answer made the admiral suspect *Caravajal*, and not without much cause.

First, because before *Caravajal* was at *Xaragua*, where these rebels then were, they had often writ and sent messages to their friends that were with the lieutenant, telling them, they would come and deliver themselves up to the admiral as soon as he arrived, and therefore they desired them to intercede for them, and appease him.

Secondly, because, since they did this as soon as they heard there were two ships come to the assistance of the lieutenant, they had much more cause to perform it, knowing the admiral was not come, had not the long conference *Caravajal* had with them prevented it.

Thirdly, because if he would have done his duty, he might have kept *Koldan*, and the chief men of his gang prisoners, aboard his caraval, they having been two days aboard without any security given.

Fourthly, because knowing as he did, that they were in rebellion, he ought not to suffer them to buy aboard the ships, as they did, 56 swords, and 60 cross-bows.

Fifthly, because there being some proofs that the men who were to land with *John Anthony* to go to *S. Domingo*, would join the rebels, he ought not to suffer them to land, or at least when they were gone over to them, he ought to have been more industrious to endeavour to recover them.

Sixthly, because he gave out that he came to the *Indies* as companion to the admiral, that nothing might be done without him, for fear the admiral should commit some offence.

Seventhly, because *Roldan* had writ to the admiral by *Caravajal* himself, acquainting him, that he was drawing near to *S. Domingo* with his men, by the advice of *Caravajal*, to be the nearer to treat of an accommodation, when the admiral arrived in *Hispaniola*; and now he was come, his actions not suiting with his letter, it appeared he had rather invited him to come thither, to the end that if the admiral had been long coming, or had not come at all, he as the admiral's associate, and *Roldan* as

Vol. II.

chief justice, might govern the island in despite of the lieutenant.

Eighthly, because at the same time that the other captains came with the three caravals to *S. Domingo*, he came by land attended by a guard of the rebels, and one of the chief of them called *Gamir*, who had been two days and two nights with him aboard his ship.

Ninthly, because he writ to the rebels when they came to *Bonao*, and sent them presents and provisions.

Tenthly, and lastly, because, besides that the said rebels would not treat with anybody but him, they all unanimously said, if there had been occasion, they would have taken him for their captain.

Yet the admiral on the other side, considering that *Caravajal* was a discreet prudent person, and a gentleman, and that every one of those arguments might be answered, and perhaps what he had been told was not true, and looking upon him, as one that would not do any thing contrary to his duty, having a great desire to put out that fire, he resolv'd to consult with all the chief men he had about him, about *Roldan's* answer, and resolve upon what was to be done on this occasion. All agreeing upon it, he sent *Caravajal*, with

The rebels  
reject the  
admiral's  
offers.

*Ballester*, to treat, who had no other answer from *Roldan*, but that since they had not brought the *Indians* he demanded, they should not without them talk of any accommodation. *Caravajal* discreetly answering to these words, made so taking a discourse, that he mov'd *Roldan* and three or four of the chief men to go wait upon the admiral and agree with him; but the others disliking of it, as *Roldan* and the others were mounting their horses to go with *Caravajal* to the admiral, they fell upon them, saying, they would not allow them to go, and that if any agreement was to be made, it should be drawn up in writing, that they might all know what was doing: So that after some days pass'd upon this resolution, on the 20th of October, *Roldan* by the consent of all his men, writ a letter to the admiral, laying the blame of their separation on the lieutenant; and telling the admiral, that since he had not in writing sent them security to come and give an account of themselves, they had resolved to send him their demands in writing, which were the reward of what they had hitherto done, as shall appear hereafter. Though their proposals were extravagant and insolent, yet the commander *Ballester*, the next day writ to the admiral, extolling *Caravajal's* moving discourse, and

7 M

saying

saying, that since it was not of force to remove those people from their wicked design, nothing less than granting them what they demanded would prevail; for he found them so resolute, that he looked upon it as most certain, that most of the people that were with his lordship would go over to the rebels. And tho' he might rely on his servants and men of honour, yet they would not be able to withstand such a number, many daily resorting to them, which the admiral already knew by experience; for when Roldan was near *S. Domingo*, he muster'd all that were fit to bear arms, if it were requisite, and observ'd, that some feigning themselves sick, and some lame, he had not found above 70 men, of which there were not 40 that he could confide in. For which reason, the next day, being the 17th of *October* 1498 the aforelaid Roldan, and the chief of his followers, who would have gone to the admiral, sent him a letter subscribed by them, telling him, they had withdrawn from the lieutenant to save their lives, he having a design to destroy them; and that they being his lordship's servants, whose coming they had expected, as of one, that would look upon what they had done complying with their duty, as good service, they had hindred their people from doing harm to any that belong'd to his lordship, as they might easily have done. But that since he was come, and was so far from thinking, that he insist'd upon ta-

king revenge, and doing them harm, that they might with honour do what they had undertaken, and be at liberty to do it, they took leave of him and his service. Before this letter was delivered to the admiral, he had sent Roldan an answer. Caravajal, whom he sent to him, telling him what confidence he always repos'd in him, and what a good account he had given his catholick majesty of them, adding, that he did not write to him for fear of some inconvenience, if his letter should be seen by the common sort, which might redound to his disadvantage, and therefore instead of hand and seal, he had sent that person to him, in whom he knew how much he confided, and might regard what he said, as if it were under his seal, which was the commander Ballester; and therefore he might consider what was proper to be done, and he should find him most ready to comply. On the 18th of *October*, he ordered five ships to depart for *Spain*, sending their catholick majesties by them, a most particular account of affairs, and saying, he had kept those ships till then, believing that Roldan and his men would have gone away in them, as they had given out at first; and that the other three he kept with him, were fitting out for his brother to go in them to pursue the discovery of the continent of *Paria*, and take order about the fishery and trade for pearls, a sample whereof he sent them by *Arogial*.

## C H A P. LXXX.

*How Francis Roldan went to treat with the admiral, but came to no agreement with him.*

Roldan having received the admiral's letter, answer'd the third day, seeming to incline to do all he order'd him, but his men not allowing him to go to treat without a safe-conduct, he desir'd him to send one, drawn up according to those heads he sent under his hand, and sign'd by the chief men about him. This safe-conduct was immediately sent him by the admiral on the 26th of *October*, and Roldan having received it, soon came, but rather with a design to draw some body over to him, than to conclude any thing, as appeared by his impudent proposals. Thus he return'd without concluding any thing, saying, He would give his company an account of matters, and write word what they resolv'd on. And that there might be some body from the admiral to treat and sign what was agreed on, the admiral's steward went with him, his name was *Salamanca*. After much talk, Roldan sent articles of agreement for the

admiral to subscribe, telling him, That was all he could obtain of his people, and if his lordship thought fit to grant it, he should send his assent to the *Conception*; for at *Bonao* they had no longer provisions to subsist on, and they would expect his answer till the next monday. The admiral having read their answer and proposals, and considering what dishonourable things they demanded, would not grant them, lest he should bring himself, his brothers, and justice it self into contempt. But that they might have no cause to complain, or say he was too stiff in this affair, he ordered a general pardon to be proclaim'd, and to be 30 days upon the gates of the fort, the purport whereof was as follows.

“ THAT for as much as during his absence in *Spain*, some difference had happened between the lieutenant, and the chief justice Roldan, and other persons

A general  
pardon.

“ sons who had fled with him, notwith-  
“ standing any thing that had happened,  
“ they might all in general, and every one  
“ in particular, safely come to serve their  
“ catholick majesties, as if no difference had  
“ ever been, and that whosoever would go  
“ into *Spain* should have his passage, and  
“ an order to receive his pay, as was usual  
“ with others, provided they presented  
“ themselves before the admiral within 30  
“ days, to receive the benefit of this par-  
“ don, protesting that in case they did not  
“ appear within the time limited, they  
“ should be proceeded against according to  
“ course of law.

This pardon, subscrib'd by himself, he  
sent to *Roldan* by *Caravajal*, giving him in

writing, the reasons why he neither could  
nor ought to grant the articles sent by him,  
and putting him in mind what they ought  
to do, if they aim'd at their majesties ser-  
vice. *Caravajal* went to the rebels at the  
*Conception*, where they were very haughty  
and proud, laughing at the admiral's par-  
don, and saying, He should soon have oc-  
casion to ask one of them. All this hap-  
pened in the space of three weeks, during  
which time, under colour of apprehending  
a man *Roldan* would execute, they kept the  
commander *Ballester* besieged in the fort,  
and cut off his water, believing the want of  
it would oblige him to surrender; but up-  
on *Caravajal*'s arrival, they rais'd the siege,  
and after many alterations made on both  
sides, came to the following conclusion.

# CHAP. LXXXI.

*The agreement made between the admiral, and Roldan with his rebels.*

THE articles signed and agreed to by  
*Francis Roldan*, and his company, in  
order to their return to *Spain*, are as fol-  
lows.

Articles of  
agreement.

I. THAT the lord admiral give  
him two good ships, and in  
good order, according to the judgment  
of able seamen, to be delivered to him  
at the port of *Xaragua*, because most of  
his followers were there; and because  
there is no other port more commodious  
to provide and prepare victualling and  
other necessaries, where the said *Roldan*  
and his company shall embark, and sail  
for *Spain*, if so God please.

II. That his lordship shall give an  
order for the payment of the salaries due  
to them all till that day, and letters of  
recommandation to their catholick ma-  
jesties, that they may cause them to be  
paid.

III. That he shall give them slaves  
for the service they have done in the  
island, and their sufferings, and certifie  
the said gift: And because some of them  
have women big with child, or deliver-  
ed; if they carry them away, they shall  
pass instead of such slaves they were to  
have; and the children shall be free, and  
they may take them along with them.

IV. His lordship shall put into the  
aforesaid ships all the provisions requisite  
for that voyage, as has been given to  
others before; and because he could not  
furnish them with bread, the judge and  
his company have leave to provide in  
the country, and that they have 30  
hundred weight of biscuit allowed them,

or for want of it 30 sacks of corn; to  
the end, that if the *Carabi* or *Indian*  
bread should spoil, as might easily hap-  
pen, they may subsist upon the aforesaid  
biscuit or corn.

V. That his lordship shall give a  
safe-conduct for such persons as shall  
come to receive the orders for their pay.

VI. For as much, as some goods be-  
longing to several persons, who are with  
*Roldan*, have been seiz'd, his lordship  
shall order restitution to be made.

VII. That his lordship shall write a let-  
ter to their catholick majesties, acquaint-  
ing them, That the said *Roldan*'s swine  
remain in the island, for the inhabitants  
provision, being 120 great ones, and  
230 small, praying their highness to al-  
low him the price for them they would  
have bore in the island; the which  
swine were taken from him in *February*  
1498.

VIII. That his lordship shall give the  
said *Roldan* full authority to sell some  
goods he has, which he must part with  
to go away, or to do with them as he  
pleases, or to leave them for his own  
use with whom he thinks fit to make the  
best of them.

IX. That his lordship will order the  
judges to give speedy judgment concern-  
ing the horse.

X. That if his lordship shall find the  
demands of *Salamanca* to be just, he shall  
write to the said judge to cause him to  
be paid.

XI. That his lordship shall be discon-  
fessed concerning the captain's slaves.

XII. That forasmuch as the said  
*Roldan*

" Roldan and his company mistrust, that  
 " his lordship, or some other person by  
 " his order, may offer them some violence  
 " with the other ships that are in the island,  
 " he shall therefore grant them a pass or  
 " safe-conduct, promising in their majes-  
 " ties name, and upon his own faith, and  
 " the word of a gentleman, as is used in  
 " Spain, that neither his lordship, nor any  
 " other person shall offend them, or ob-  
 " struct their voyage.

Having examined this agreement made by *Alonso Sanchez de Caravajal* and *James de Salamanca*, with *Francis Roldan* and his company, this day being *Wednesday* the 21st of *November* 1498, I am content it be fully observed, upon condition that the said *Francis Roldan*, nor any of his followers, in whose name he subscribed and ratified the articles by him delivered to the aforesaid *Alonso Sanchez de Caravajal* and *James de Salamanca*, shall not receive into their company any other christian of the island, of any state or condition whatsoever.

I *Francis Roldan*, judge, do promise and engage my faith and word for myself and all those with me, that the articles abovementioned shall be observed and fulfilled, without any fraud, but faithfully as is here set down, his lordship performing all that has been agreed on between *Alonso Sanchez de Caravajal* and *James de Salamanca*, and my self, as is in the written articles.

I. " **T**hat from the day of the date here-  
 " of, till the answer be brought,

" for which ten days shall be allowed, I  
 " will admit no person whatsoever of those  
 " that are with the lord admiral.

II. " That within fifty days after the  
 " said answer shall be delivered to me here  
 " in the *Conception*, signed and sealed by  
 " his lordship, which shall be within the  
 " ten days before-mentioned, we will em-  
 " bark and set sail for *Spain*.

III. " That none of the slaves freely grant-  
 " ed us, shall be carried away by force.

IV. " That whereas the admiral will not  
 " be at the port where we are to embark,  
 " the person or persons his lordship shall  
 " send thither, be honoured and respected  
 " as their majesties and his lordship's officers,  
 " to whom shall be given an account of  
 " all we put aboard the ships, that they  
 " may enter it, and do as his lordship shall  
 " think fit; as also to deliver to them such  
 " things as we have in our hands belong-  
 " ing to their majesties. All the afore-  
 " said articles are to be subscribed and per-  
 " form'd by his lordship, as *Alonso Sanchez*  
 " *de Caravajal*, and *James de Salamanca*,  
 " have them in writing; the answer where-  
 " of I expect here at the *Conception* for  
 " eight days to come; and if it be not  
 " then brought, I shall not be obliged to  
 " any thing here mention'd.

In testimony whereof, and that I and my company may observe and perform what I have said, I have subscribed this writing, given at the *Conception*, on the 16th of *November* 1498.

#### C H A P. LXXXII.

*How after the agreement concluded, the rebels went away to Xaragua, saying, they would embark on the two ships sent them by the admiral.*

**T**Hings being adjusted as above, *Caravajal* and *Salamanca* returned to *St. Domingo* to the admiral, and at their request, on the 21st of *November*, he subscribed the aforesaid articles brought by them, and granted a new safe-conduct or leave to all those that would not go to *Spain* with *Roldan*, promising them pay, or the liberty of planters, as they liked best, and for others to come freely to manage their affairs. These the *Castellan Balleser* delivered to *Roldan* and his company at the *Conception* on the 24th of *November*, and they having received them, went away toward *Xaragua*, to prepare for their departure, as was afterwards known. And tho' the admiral was sensible of their villainy, and much concerned that the good

service his brother might have done in continuing the discovery of the continent of *Paria*, and settling the pearl fishery and trade, was obstructed by giving them those ships, yet he would not give the rebels occasion to blame him, saying, he had refused them their passage. He began therefore presently to fit out the ships as had been agreed, tho' the equipment was somewhat retarded for want of necessities. To supply which defect, and that no time might be lost, he ordered *Caravajal* to go over by land to provide and dispose all things for the departure of the rebels, whilst the ships came about, giving him ample commission for it, resolving himself to go soon to *Isabella*, to settle affairs there, leaving his brother *James* at *St. Domingo*, to look to that

that place. After his departure, about the end of *January*, the two caravals furnish'd with all necessaries for the voyage, set out to take up the rebels, but a great storm rising by the way, they were forced to put into another port till the end of *March*; and because the caraval *Ninna*, one of the two, was in the worst condition, and re-

quired most repairs, the admiral sent orders to *Peter de Arana* and *Francis de Garai*, to repair to *Xaragua* with another called *Santa Cruz* or the *Holy Cross*, aboard which *Caravajal* went, and not by land. He was 11 days by the way, and found the other caraval waiting for him.

C H A P. LXXXIII.

*How the rebels altered their resolution of going to Spain, and came to a new agreement with the admiral.*

IN the mean while, the caravals not coming, and most of *Roldan's* men having no mind to embark, they took that delay for a pretence to stay, blaming the admiral, as if he had not dispatch'd them as soon as he might; whereof he being informed, writ to *Roldan* and *Adrian*, persuading them in a friendly manner to perform the agreement, and not fall into disobedience. Besides, *Caravajal*, who was with them at *Xaragua*, on the 20th of *April*, entered his protestation before a notary, called *Francis de Garai*, afterwards governor of *Panuco* and of *Jamaica*, requiring them, since the admiral had sent the ships, to accept of them, and embark according to articles. And because they would not, on the 25th of *April* he ordered the ships to return to *St. Domingo*, because they were destroyed by the worms, and the men suffered much for want of provisions. The rebels were no way concerned, but rather rejoiced and grew haughty, seeing such account was made of them, and were so far from acknowledging the admiral's civility, that they laid it to his charge in writing, that it was through his fault they staid, saying, he had a mind to be revenged on them, and had therefore delayed the sending of the caravals, which were in such ill case, that it was impossible they should go in them to *Spain*, and that tho' they had been never so good, their provisions were spent expecting them, and they could not get more under a long while, for which reason they had resolved to expect redress from their majesties. *Caravajal* returned with this answer by land to *St. Domingo*, to whom at the time of his departure, *Roldan* said, he would willingly go wait on the admiral, to endeavour for such an accommodation, as might please all parties, provided he would send him his safe-conduct. *Caravajal* sent the admiral word of it from *St. Domingo*, on the 15th of *May*, who answered on the 21st, commending him for the pains he took, and sent the safe-conduct he required, with a short letter to *Roldan*, the

quit Spain.

very pithy, persuading him to peace, submission, and their majesties service; which he afterwards repeated at *S. Domingo*, more at large on the 29th of *June*; and on the 3d of *August*, six or seven of the chief men about the admiral, sent *Roldan* another safe-conduct, that he might come to treat with his lordship. But the distance being great, and the admiral having occasion to visit the country, he resolved to go with two caravals to the port of *Azuza* in the same island *Hispaniola*, west of *S. Domingo*, to be the nearer the province where the rebels were, many of whom came to the said port; and the admiral arriving there about the end of *August* with his ships, confer'd with the chief of them, exhorting them to desist from their ill course, and promising them all possible favour and kindness, which they promised to do, provided the admiral granted them four things, *viz.*

- I. "THAT he should send fifteen of them to *Spain* in the first ships that went.
- II. "That to those that remained, he should give land and houses for their pay.
- III. "That proclamation should be made, that all what had happened was caused by false suggestions, and through the fault of ill men.
- IV. "That the admiral shall appoint *Roldan* perpetual judge.

This being concluded among them, *Roldan* returned ashore from the admiral's caraval, and sent his companions the articles, which were so much to their mind, and so unreasonable, that they concluded, saying, in case the admiral fail'd in any part, it should be lawful for them by force, or any other means, to oblige him to performance. The admiral being eager to conclude this difficult matter, which had lasted above two years; and considering his adversaries continued more obstinate than ever, and that

many of those, who were with him, had a mind to join companies, and conspire together to go to other parts of the island, as *Roldan* had done; he resolv'd to sign the articles whatsoever they were, viz. To grant *Roldan* a patent for perpetual judge, and the other three above-mentioned particulars, besides all they had sent in writing, a copy whereof was insert'd above. On *Tuesday* following, being the 5th of *November*, *Roldan* to exercise his office, and

accordingly it being a part of his grant, he constituted *Peter Riquelme* judge of *Bonao*, with power to imprison offenders in criminal cases, but that he should send criminals upon life and death, to be tried by him at the fort of the *Conception*. The substitute being no honeste than his master, he presently went about to build a strong house at *Bonao*, had not *Peter de Arana* forbid him, because he plainly perceiv'd it was contrary to the respect due to the admiral.

## C H A P. LXXXIV.

*How Ojeda returning from his discovery, excited new troubles in Hispaniola.*

TO return to the course of our history, the admiral having adjust'd matters with *Roldan*, appointed a captain with some men to march about the island to pacify it, and reduce the *Indians* to pay the tribute, and be always in a readiness, that upon the least mutiny among the christians, and sign of rebellion among the *Indians*, he might suppress and punish them, which he did with a design to go himself over to *Spain*, and carry with him his brother the lieutenant, because it would be difficult if he were left behind, to forget old grudges. As he was preparing for his voyage, *Alonso de Ojeda*, who had been discovering with four ships, arriv'd in the island. And forasmuch as this sort of men sail'd about to make their fortune, on the 5th of *September* he put into the port the christians called *Brasil*, and the *Indians Taquimo*, designing to take what he could from the *Indians*, and load with wood and slaves. Whilst he was thus employ'd, he did all the harm he could, and to show he was a limb of the bishop we have mention'd, endeavour'd to raise another mutiny, gave out, that queen *Isabel* or *Elizabeth* was ready to die; and as soon as she was dead, there would be no body left to support the admiral, and that he as a faithful servant to the said bishop, might do what he pleas'd against the admiral, because of the enmity there was between them. Upon these grounds he began to write to some that were not very sound, after the late troubles, and to hold correspondence with them. But *Roldan* being inform'd of his proceedings and designs, by the admiral's order, went against him with 21 men, to prevent him doing the harm he intended: Being come within a league and a half of him on the 29th of *September*, he understood he was with 15 men at a *Caciques*, whose name was *Haniguaaba*, making bread and bisket, and therefore he travel'd that night to surprize him. *Ojeda* understanding that *Roldan* was com-

ing upon him, and being too weak to oppose him, to make the best of a bad case, went to meet him, saying, want of provisions had brought him thither, to supply himself in the king his master's dominions, without designing any harm. And giving him an account of his voyage, said, he had been discovering 600 leagues westward along the coast of *Paria*, where he found people that fought the christians even hand, and had wounded 20 of his men, for which reason he could make no advantage of the wealth of the country, where he said he had seen deer and rabbits and tygers skins and paws and *Gaaninies*, all which he show'd *Roldan* aboard the caravals, saying, he would soon repair to *S. Domingo* to give the admiral an account of all. He at this time was much troubled, because *Peter de Arana* had signified to him, that *Riquelme*, judge of *Bonao*, for *Roldan*, under colour of building a house for his herds, had made choice of a strong rock, that he might from thence, with a few men, do all the harm he thought fit; that he had forbid him: Whereupon *Riquelme* had drawn up a process, attested by witnesses against him, and sent it to the admiral, complaining that *Arana* used violence towards him, and praying relief, that no disorder might happen among them. Hereupon, tho' the admiral knew that man was not of a quiet disposition, yet he thought fit to conceal his jealousy, yet so as to be upon his guard, being of opinion it was enough to provide against *Ojeda's* open intrusion, without taking notice of that which might tolerably be conniv'd at. *Ojeda* holding his wicked purpose, and taking leave of *Roldan* in *February* 1500, went away with his ships to *Xaragua*, where a great many of those lived, who had before rebelled with *Roldan*. And because avarice is the most beneficial and ready way to promote any mischief, he began to give out among those people, that their catholick majesties had appointed him

him and *Caravajal* the admiral's counsellors, that they might not suffer him to do any thing, which they did not think was for their majesties service; and that among many other things they had ordered him to do; one was, that he should immediately pay in ready money, all those that were in the island in their service; and since the admiral was not so just as to do it, he was ready to go along with them to *S. Domingo*, to oblige him to pay them out of hand; and that done, if they thought fit, to turn him out of the island dead or alive; for they ought not to rely on the agreement made, or the word he had given them, for he would keep it no longer than necessity obliged him to it. Upon these promises many resolved to follow him, and therefore being assisted by them, he one night fell upon others who opposed him, and there were some killed and wounded on both sides. And being satisfied that *Roldan*, who was returned to the admiral's service, would not join with them, they resolved to surprize and make him prisoner; but he being informed of their design, went well attended where *Ojeda* was, to put a stop to his disorders, or punish him, as he should find expedient. *Ojeda* for fear of him, retired to his ships, and *Roldan* continuing ashore, they treated about a conference, each of them fearing to put himself into the power of the other. *Roldan* perceiving that *Ojeda* was unwilling to come ashore, he offered to go treat with him aboard; to which purpose he sent to ask his boat, which he sent him well mann'd, and having taken in *Roldan* with six or seven of his followers, when they least suspected it, *Roldan* and his people on a sudden fell upon *Ojeda*'s men, with their naked swords, and killing some and wounding others, made themselves masters of the boat, returning with it to land, *Ojeda* having only a small skiff left him, in which he resolved to come peaceably to treat with *Roldan*. Having made some excuse for his offences, he agreed to restore some men he had taken by force, that his boat and men might be returned him, alledging, if it were not restored, it would be the ruin of them all and their ships, because he had no other fit to serve them. *Roldan* readily granted it, that he might have no cause to complain, or say, he was lost through his means, yet making him promise and give security that he would depart the island by a time appointed, as he was obliged to do, by the good guard *Roldan* kept ashore. But as it is a hard matter to root out cockle so that it may not sprout up again, so is it no less difficult for people that have got a habit of doing ill to forbear relapsing into

their crimes, as happened to some of the rebels a few days after *Ojeda* was gone. For one *D. Ferdinand de Guevara*, being in disgrace with the admiral, as a seditious person, and having taken part with *Ojeda*, in hatred to *Roldan*, because he would not permit him to take to wife the daughter of *Canua*, the principal queen of *Xaragua*, began to gather many conspirators to secure *Roldan*, and succeed him in the ill things he had done. Particularly he gained to his party, one *Adrian de Moxica*, a chief man among the late rebels, and to other wicked men, who about the middle of July 1500, had contrived to secure or murder *Roldan*. He having intelligence of the design, stood upon his guard, and ordered his business so well, that he seized the aforesaid *D. Ferdinand*, *Adrian*, and the chief men of their party, and sending the admiral an account of what had happened, asked what his pleasure was he should do with them? The answer was, That since they had endeavoured, without any provocation to disturb the country, (and if they were not punished every thing must run to ruin) he should punish them according to their demerits, and as the law directed. The judge did it accordingly, and proceeding legally against them, hanged *Adrian* as chief author of the conspiracy, banished others, and kept *D. Ferdinand* in prison, till on the 13th of June he delivered him, with other prisoners, to *Gonsalo Blanco*, to carry them to *la Vega*, that is, the Plain, where the admiral then was. This example quieted the country, and the Indians again submitted themselves to the christians. Such rich gold mines were discovered, that every man left the king's pay, and went away to live upon his own account, applying himself to dig gold at his own expence, allowing the king the third part of all they found. This prospered so well, that a man has gathered five marks, (a mark is eight ounces) of gold in a day, and a grain of pure gold has been taken up worth above 196 ducats; and the Indians were submissive, dreading the admiral, and so desirous to please him, that they readily became christians only to oblige him. When any of the chief of them was to appear before him, he endeavoured to be clad; and therefore to settle all things the better, the admiral resolved to take a progress thro' the island, and accordingly he and his brother and lieutenant set out on Wednesday the 20th of Feb. 1499, and came to *Isabella* on the 19th of March. From *Isabella* they set out the 5th of April for the *Conception*, and came thither the Tuesday following. The lieutenant went thence for *Xaragua* upon Friday the 7th of June. On Christmas-

Another  
rebellion  
suppressed.

## The first Discovery of

day following, which was in the year 1499, being forsaken by all the world, the *Indians* and rebel christians fell upon me, and I was reduced to such distress, that to avoid death, leaving all behind me, I put to sea in a little caraval. But our lord presently relieved me, saying, Thou man of little faith, fear not, I am with you, and so he dispersed my enemies, and show'd

how he could fulfil my promises: Unhappy sinner that I am, who placed all my hopes on the world. From the *Conception* the admiral designed to go to *S. Domingo* on the 3d of February, in order to make ready to return into *Spain* to give their catholic majesties an account of all things.

## C H A P. LXXXV.

*How their catholic majesties upon false informations, and malicious complaints of some persons, sent a judge to take cognizance of affairs.*

Com-  
plaints  
against the  
admiral.

**W**Hilst these disorders happened, as has been said, many of the rebels by letters sent from *Hispaniola*, and others that were returned into *Spain*, did not cease to give in false informations to the king and his council, against the admiral and his brothers, saying, they were cruel and unfit for that government, as well because they were strangers and aliens, as because they had not formerly been in a condition to learn by experience how to govern people of condition; affirming, that if their highnesses did not apply some remedy, those countries would be utterly destroy'd; and in case they were not quite ruined by their ill government, the admiral would revolt, and join in league with some prince to support him, he pretending that all was his own, as having been discovered by his industry and labour; and that the better to compass his design, he concealed the wealth of the country, and would not have the *Indians* serve the christians, nor be converted to the faith, because by making much of them he hoped they would be of his side, to do what he pleased against their highnesses. They proceeding in these and such like slanders, importuned their catholic majesties, ever talking ill of the admiral, and complaining there were several years pay due to the men, gave occasion to all that were at court to rail. So that when I was at *Granada*, at the time the most serene prince *Michael* happened to die, above 50 of them, like shameless wretches, brought a load of grapes, and sat down in the court of *Alhambra*, (a castle and palace) crying out, that their highnesses and the admiral made them live so miserably by not paying them, with many other scandalous expressions. And their impudence was so great, that if the catholic king went abroad, they all got about him, crying, pay, pay. And if it happened that my brother or I, who were pages to her majesty, passed by where they were, they cried out in a hideous manner, making the sign of the cross, and saying, there are the

admiral of the *Mosquito*'s sons, he that has found out false and deceitful countries, to be the ruin and burial place of the *Spanish* gentry; adding many more such insolencies which made us cautious of appearing before them. Their complaints running so high, and their constant importunity with the king's favourites, it was resolved to send a judge to *Hispaniola*, to enquire into all these affairs, ordering him in case he found the admiral guilty of what was alledged, to send him to *Spain*, and stay there himself as governor. The person their majesties made choice of for this purpose, was one *Francis de Bovadilla*, a poor knight of the order of *Calatrava*, who on the 21st of May 1499, had full and ample commission given him at *Madrid*, and blank letters, subscribed by their majesties, to such persons as he should think fit in *Hispaniola*, commanding them to be aiding and assisting to him. Thus furnished, he arrived at *S. Domingo* at the latter end of August 1500, at such time as the admiral was at the *Conception*, settling the affairs of that province, where his brother had been assaulted by the rebels, and where there were more *Indians*, and those more understanding people than in the rest of the island. So that *Bovadilla* at his arrival finding no body to keep him in awe, the first thing he did was to take up his quarters in the admiral's palace, and seize and make use of all he found there, as if it had fallen to him by inheritance; and gathering together all he could find that had been in rebellion, and many others that hated the admiral and his brothers, he presently declared himself governor. And to gain the affections of the people, he caused a general freedom to be proclaimed for 20 years to come; requiring the admiral to repair to him without any delay, because it was convenient for his majesty's service he should do so. And to back his summons on the 7th of September, sent him the king's letter by *R. John de la Sosa*, which was to this effect.

*Bovadilla  
the judge  
in Hispaniola.*

mises: Unhappily placed all my from the Concept to go to S. Domingo, in order to Spain to give account of all

To D. Christopher Columbus, our admiral of the ocean.

fore we desire you to give him entire credit, and to obey him. Given at Madrid the 21st of May 1499.

the prac- tice of Bovadilla.

Bovadilla the judge in Hispaniola.

THE admiral having seen their majesties letter, came away presently to St. Domingo, where the afore said judge was, who being eager to remain governor there, at the beginning of October 1500. without any delay, or legal information, sent him prisoner a board a ship, together with his brother James, putting them in irons, and a good guard over them, and ordered upon severe penalties, that none should dare to speak for them. After this, (by Abington law) he began to draw up a process against them, admitting the rebels his enemies as witnesses, and publicly favouring all that came to speak ill of them, who in their depositions gave in such villainies and incoherencies, that he must have been blind that had not plainly perceiv'd, they were false and malicious. For which reason, their catholic majesties would not admit of them, and cleared the admiral, repenting that they had sent such a man in that employment; and not without good cause, for this Bovadilla ruin'd the island, and squander'd the king's revenues, that all men might be his friends, saying, their majesties would have nothing but the honour of the dominion, and that the profit should be for their subjects. Yet he neglected not his own share, but siding with the richest and most powerful men, gave them Indians to serve them, upon condition they should share with him all they got by their means, and sold by auction the possessions and rights the admiral had acquir'd for their majesties, saying, they were no labourers, nor did they desire to make a profit of those lands, but only kept them for the benefit of their subjects. He thus selling all things under this colour, endeavoured on the other side that they should be bought by some of his own companions, for one third of the value. Besides all this, he made no other use of his judicial power but to enrich himself, and gain the affections of the people, being still afraid lest the lieutenant, who was not yet come from Xaragua, should put a stop to his proceedings, and

endeavour to set the admiral at liberty by force of arms; in which particular, the brothers behav'd themselves very prudently; for the admiral sent them word immediately, that they should come peaceably to him, the king's service so requiring, that the island might not be put into an uproar; for when they were in Spain, they should more easily obtain the punishment of such a senseless person, and satisfaction for the wrong done them. Yet this did not divert Bovadilla from putting him and his brothers into irons, allowing the baster fort to rail at them publicly, blowing horns about the port where they were shipp'd, besides many scandalous libels set up at corners of streets against them; so that tho' he was inform'd that one James Ortiz, governor of the hospital, had writ a libel, and read it publicly in the marketplace, he was so far from punishing of him, that he seem'd to be very well pleas'd, which made every one endeavour to show himself in this sort. And perhaps for fear the admiral should swim back, he took care when they were to sail, to desire Andrew Martin the master of the ship, to look to him, and to deliver him in irons as he was, to the bishop D. John de Fonseca, by whose advice and direction it was concluded he did all these things; tho' when they were at sea, the master being sensible of Bovadilla's unworthiness, would have knock'd off the admiral's irons, which he would never permit, saying, that since their catholic majesties, by their letter directed him to perform whatsoever Bovadilla did in their name command him to do, in virtue of which authority and commission he had put him into irons, he would have none but their highnesses themselves to do their pleasure herein; and he was resolv'd to keep those fetters as relics, and a memorial of the reward of his many services, as accordingly he did; for I always saw those irons in his room, which he order'd to be buried with his body; notwithstanding, that he having on the 20<sup>th</sup> of November

The admiral dis-  
cuss'd.

1500. writ to their majesties, acquainting them with his arrival at *Cadiz*; they understanding the condition he came in, immediately gave orders that he should be releas'd, and sent him very gracious letters, saying, they were very sorry for his sufferings, and the unmannerly behaviour of *Bovadilla*: towards him, ordering him to go to court, where care should be taken about his affairs, and he should be shortly dispatch'd with full restitution of his honour. Nevertheless, I cannot but blame their catholick majesties, who chose for that employment a base and ignorant man; for had he been a man who knew the duty of his office, the admiral himself would have been glad of his coming; since he by letter had

desired that one might be sent, to take true information of the perverseness of those people, and of the crimes they committed, that they might be punish'd. And another hand, he being unwilling to use that severity which an impartial person would have done, because the original of those tumults had been against his brother. And tho' it may be urg'd, that tho' their majesties had such bad accounts of the admiral, yet they ought not to send *Bovadilla* with so many letters, and such power, without limiting the commission they gave him: It may be answer'd in their behalf, that it was no wonder they did so, because the complaints against the admiral were many, as has been said above.

### C H A P. LXXXVII.

*How the admiral went to court to give their catholick majesties an account of himself.*

AS soon as their majesties heard of the admiral's coming, and being in irons, they sent orders on the 12<sup>th</sup> of December for him to be set at liberty, and writ to him to repair to *Granada*, where he was received by their highnesses with a favourable aspect, and kind words, telling him, his imprisonment had not been by their desire or command, and therefore they were much offended at it, and they would take care those that were in fault should be punish'd, and full satisfaction given him. Having spoke these and such like gracious words, they order'd his business should be immediately gone upon, the result whereof was, that a governor should be sent to *Hispaniola*, who was to right the admiral and his brothers, and *Bovadilla* should be obliged to restore all he had taken from them; and that the admiral should be allow'd all that belong'd to him, according to the articles their highnesses had granted him; and that the rebels should be proceeded against and punish'd according to their offences. *Nicolas de Obando*, commendary of laws, was sent with this power; he was a wife and judicious man, but as afterwards appear'd partial, craftily concealing his passions, giving credit to his own surmises, and malicious persons; and therefore acting cruelly and revengefully, as appears by the death of the eighty kings we have spoken of before. But to return to the admiral; as their majesties were pleas'd to send *Obando* to *Hispaniola*, so they thought it proper to send the admiral upon some voyage that might turn to his advantage, and keep him employ'd till the said *Obando* could pacify and reduce the island *Hispaniola*, because

The admiral well receiv'd at court.

they did not like to keep him so long out of his right, without any just occasion, the information sent by *Bovadilla* plainly appearing to be full of malice, and not containing any thing whereby he might forfeit his right. But there being some delay in the execution of this design, it being now the month of October 1500. and ill men endeavour'd to prevail that a new information might be expected, the admiral resolv'd to speak to their majesties, and beg of them that they would defend him against all dangers, which he afterwards repeated by letter. This they promis'd him by letter, when the admiral was ready to set out upon his voyage; the words of it are to this effect:

AND be assured that your imprisonment was very displeasing to us, which you were sensible of, and all men plainly saw, because as soon as we heard of it, we applied the proper remedies. And you know with how much honour and respect we have always ordered you to be treated, which we now direct should be done, and that you receive all worthy and noble usage, promising that the privileges and prerogatives by us granted you shall be preserv'd in ample manner, according to the tenor of our letters patents, which you and your children shall enjoy without any contradiction, as is due in reason: And if it be requisite to ratify them a-new, we will do it, and will order that your son be put into possession of all, for we desire to honour and favour you in greater matters than these. And be satisfied we will take the due

The admiral well receiv'd at court.

" due care of your sons and brothers, which  
" shall be done when you are departed ;  
" for the employment shall be given to  
" your son, as has been said. We there-  
" fore pray you not to delay your departure.  
*Given at Valentia de la Torre, on the 14<sup>th</sup>  
of March 1502.*

This their majesties writ, because the admiral had resolved not to trouble himself any more with the affairs of the *Indies*, but to ease himself upon my brother, wherein he was in the right ; for he said, that if the services he had already done were not sufficient to deserve to have those villainous people punish'd, all he could do for the future would never obtain it, since he had already perform'd the main thing he undertook before he discover'd the *Indies*, which was to shew that there was a continent and islands westward, that the way was easy and navigable, the advantage visible, and the people gentle and unarm'd. All which, since he had verified himself in person, there now remained nothing but for their highnesses to pursue what was begun, sending people to discover the secrets of those

countries ; for now the gate was open'd, any one might follow the coast, as some did already, who improperly call themselves discoverers ; not considering they have not discovered any new countrey, but that for the future they pursue the first discovery, the admiral having shewn them the islands and province of *Paria*, which was the first land of the continent discover'd. Yet the admiral having always had a great inclination to serve their catholick majesties, and particularly the queen, he was content to return to his ships, and undertake the voyage we shall speak of ; for he was convinced there would daily be found out great wealth, as he writ to their highnesses the year 1499. speaking of the discovery in this manner : It is not to be discontinued ; for to say the truth, because one time or other something material will be found. As has since appeared by *New Spain* and *Peru*, though at that time, as generally happens to most men, no body gave credit to what he said, and yet he said nothing but what proved true, as their catholick majesties testify in a letter of theirs writ at *Barcelona* on the 5<sup>th</sup> of *September* 1498.

# C H A P. LXXXVIII.

*How the admiral went from Granada to Seville, to fit out a fleet for another discovery.*

THE admiral having been well dispatched by their catholick majesties, set out from *Granada* for *Seville* in the year 1501. and being there, so earnestly solicited the fitting out his squadron, that in a small time he had rigg'd and provided four ships, the biggest of 70, the least of 50 tun burthen, and 140 men and boys, of which number I was one.

We set sail from *Cadiz* on the 9<sup>th</sup> of *May*, 1502. and failed to *St. Catherine's*, whence we parted on *Wednesday* the 11<sup>th</sup> of the same month, and went to *Arzilla* to relieve the *Portuguese*, who were reported to be in great distress ; but when we came thither, the *Moors* had rais'd the siege. The admiral therefore sent his brother *D. Bartolomeu Columbus*, and me, with the captains of the ships ashore, to visit the governor of *Arzilla*, who had been wounded by the *Moors* in an assault. He return'd the admiral thanks for the visit and his offers, and to this purpose sent some gentlemen to him, among whom some were relations to *Donna Philippa Moniz*, the admiral's wife in *Portugal*. The same day we set sail, and arriving at *Gran Canaria*, on the 20<sup>th</sup> of *May*, cast anchor among the little islands ; and on the 24<sup>th</sup> went over to *Maspalomas* in the

same island, there to take in wood and water for our voyage. The next night we set out for the *Indies*, and it pleas'd God the wind was so fair, that without handling the sails, on *Wednesday* the 15<sup>th</sup> of *June* we arrived at the island *Matinino* with a rough sea and wind. There, according to the custom of those that sail from *Spain* to the *Indies*, the admiral took in fresh wood and water, and made the men wash their linen, staying till *Saturday*, when we stood to the westward, and came to *Dominica*, ten leagues from the other. So running along among the *Caribbee* islands, we came to *Santa Cruz*, and on the 24<sup>th</sup> of the same month ran along the south-side of the island of *St. John*. Thence we took the way for *St. Domingo*, the admiral having a mind to exchange one of his ships for another, because it was a bad sailer, and besides, could carry no sail, but the side would lie almost under water, which was a hindrance to his voyage, because his design was to have gone directly upon the coast of *Paria*, and keep along that shore, till he came upon the streight, which he certainly concluded was about *Veraagua* and *Nombre de Dios*. But seeing the fault of the ship, he was forced to repair to *St. Domingo* to change it for a better.

And

The admiral's voyage.

And to the end the commendary *Lores* sent by their majesties to call *Bovadilla* to an account for his male-administration, might not be surpriz'd at our unexpected arrival, upon *Wednesday* the 29<sup>th</sup> of *June*, being near the port, the admiral sent *Peter de Terreros*, captain of one of the ships to him, to signify what occasion he had to change that ship; for which he, as also because he apprehended a great storm was coming, he desired to secure himself in that port, advising him not to let the fleet sail out of the port for eight days to come; for if he did it would be in great danger. But the afore said governor would not permit the admiral to come into the harbour, nor did he hinder the going out of the fleet that was bound for *Spain*, which consisted of eighteen sail, and was to carry *Bovadilla*, who had imprison'd the admiral and his brothers, *Francis Roldan*, and all the rest, who had been in rebellion against them, and done them so much harm, all whom it pleased God to infatuate, that they might not admit of the admiral's good advice. And I am satisfied it was the hand of God; for had they arrived in *Spain*, they had never been punish'd as their crimes deserv'd; but rather been favour'd and prefer'd, as being the bishop's friends. This was prevented by their setting out of that port for *Spain*; for no sooner were they come to the east point of the island *Hispaniola*, but there arose so terrible a storm, that the admiral of the fleet sunk, in which was *Bovadilla*, with most of the rebels, and made such havock among the rest, that of 18 ships, only three or four were saved. This happen'd upon *Thursday* the last of *June*, when the admiral having foreseen the storm, and being refused admittance into the port, for his security drew up as close to the land as he could, thus sheltering himself, not without much dissatisfaction among his men, who for being with him were denied that reception, which had been allowed to strangers, much more to them that were of the same nation; for they fear'd they might be so serv'd, if any misfortune should befall them for the future. And tho' the admiral was concern'd on the same account, yet it

*He foresaw a great storm, and is refus'd admittance in Hispaniola.*

more vex'd him to behold the baseness and ingratitude us'd towards him in that country he had given to the honour and benefit of *Spain*, being refused to shelter his life in it. Yet his prudence and judgment secured his ships, till the next day the tempest increasing, and the night coming on very dark, three ships broke from him every one its own way: the men aboard each of them, tho' all of them in great danger, concluded the others were lost; but they that suffer'd most were those aboard the ship called *Santo*, who to save their boat, which had been ashore with the captain *Terreros*, dragg'd it a-stern, where it over-set, and were at last forced to let it go to save themselves. But the caraval *Bermuda* was in much more danger, which running out to sea, was almost cover'd with it, by which it appeared the admiral had reason to endeavour to change it and all men concluded, that under God the admiral's brother was the saving of her, by his wisdom and resolution; for as has been said above, there was not at that time a more expert sailor than he. So that after they had all suffer'd very much, except the admiral, it pleased God they met again upon *Sunday* following in the port of *Azuza*, on the fourth-side of *Hispaniola*, where every one giving an account of his misfortunes, it appeared that *Bartolomew Columbus* had weather'd so great a storm, by flying from land like an able sailor; and that the admiral was out of danger, by lying close to the shore like a cunning astrologer, who knew whence the danger must come. Well might his enemies blame him therefore, saying, he had rais'd that storm by art magick, to be reveng'd on *Bovadilla*, and the rest of his enemies that were with him, seeing that none of his four ships perish'd; and that of 18 which set out with *Bovadilla*, only one called *la Aguja*, or *The Needle*, the worst of them all held on its course for *Spain*, where it arrived safe, having on board 4000 peso's in gold, worth eight shillings a peso, belonging to the admiral, the other three that escap'd, returning to *S. Domingo* shatter'd, and in a distressed condition.

*All his ships escape.*

*Great error of the sea charts.*

*Fourteen bound for Spain cost six*

#### C H A P. LXXXIX.

*How the admiral departed from Hispaniola, and discovered the islands of Guanaia.*

THE admiral in the port of *Azuza*, gave his men a breathing time after the storm; and it being one of the diversions us'd at sea, to fish, when there is nothing else to do, I will mention two sorts of fish among the rest, which I remember were

taken there; the one of them was pleasant, the other wonderful. The first was a fish call'd *Saavina*, as big as half an ordinary bell, which lying asleep above water, was struck with a harping-iron from the boat of the ship *Biscaina*, and held so fast, that it could

could not break loose; but being tied with a long rope to the boat, drew it after it as swift as an arrow; so that those aboard the ship seeing the boat scud about, and not knowing the occasion, were astonish'd it should do so without the help of the oars, till at last the fish sunk, and being drawn to the ship's side, was there hall'd up with the tackle. The other fish was taken after another manner, the *Indians* call it *Manati*, and there are none of the sort in *Europe*: it is as big as a calf, nothing differing from it in the colour and taste of the flesh, but that perhaps it is better and fatter; wherefore those that affirm there are all sorts of creatures in the sea, will have it, that these fishes are real calves, since within they have nothing like a fish, and feed only on the grass they find along the banks. To return to our history, the admiral having a little refresh'd his men, and repaired his ships, left port *Azuza*, and went to that of *Brasil*, which the *Indians* call *Giaccemo*, to shun another storm that was coming. Hence he sail'd again on the 14<sup>th</sup> of *July*, and was so becalm'd, that instead of holding on his course, the current carried him away to certain islands near *Jamaica*, which are very small and sandy, and he called them *Los Poros*, or *The Wells*, because not finding water in them, they dug many pits in the sand, and took up that water for their use. Then sailing southward for the continent, we came to certain islands, where we went ashore upon the biggest only, called *Guanaia*, whence those that make sea charts, took occasion to call all those islands of *Guanaia*, which are almost 12 leagues from the continent, near the province now call'd *Honduras*, tho' then the admiral called it *cape Casinas*. But these men making such charts without having seen the world, they commit vast mistakes; which since it now comes in my way, I will here set down, tho' it interrupts the course of our history. These same islands and continent are by them twice set down in their charts, as if they were different countries; and whereas *cape Gracias a Dios*, and that they call *cape . . . . .* are but one and the same, they make two of it. The occasion of this mistake was, that after the admiral had discovered these countries, one *John Diaz de Solis*, (from whom the river *de la Plata*, that is, of Silver or Plate, was called *Rio de Solis*, because he was there killed by the *Indians*;) and one *Vincent Yanez*, who commanded a ship the first voyage, when the admiral discover'd the *Indies*, set out together to discover in the year 1508. designing to follow along that coast the admiral had discovered in his voyage from *Veragua* westward; and he following almost the

VOL. II.

same track, they put into the coast of *Cariari*, and pass'd by *cape Gracias a Dios*, as far as *cape Casinas*, which they call'd *Honduras*, and the aforesaid islands they call'd *Guanaias*, giving the name of the biggest to them all. Thence they proceeded on further, without owning the admiral had been in any of those parts, that the discovery might be attributed to them, and to have it believ'd they had found large countries; notwithstanding that, *Peter de Lefesma*, one of their pilots, who had been before with the admiral in his voyage to *Veragua*, told them, he knew that country, and that he had been there with the admiral discovering it, from whom I afterwards had this. But the nature of the charts plainly demonstrates it; for the same thing is twice set down, and the island is in the same shape, and at the same distance, they having at their return brought a true draught of that country, only saying, it lay beyond that which the admiral had discover'd. So that the same country is twice describ'd in one chart; which, if it please God, time will make appear, when that coast is better known; for they will find but one country of that sort, as has been said. But to return to our discovery, being come to the island of *Guanaia*, the admiral order'd his brother *Bartholomew Columbus* to go ashore with two boats, where they found people like those of the other islands, but not of such high foreheads. They also saw abundance of pine-trees and pieces of *Lapis Calaminaris*, us'd to mix with copper, which some seamen taking for gold, kept hid a long time.

The admiral's brother being ashore in that island, very desirous to know something of it, fortune so order'd it, that a canoe as long as a galley, and eight foot wide, all of one tree, and like the others in shape, put in there, being loaded with commodities brought from the westward, and bound towards *New Spain*. In the midst of it was a covering like an awning made of palm-tree leaves, not unlike those of the *Venetian Gondola's*, which kept all under it so close, that neither rain nor sea-water could wet the goods. Under this awning were the children, the women, and all the goods, and tho' there were 25 men aboard this canoe, they had not the courage to defend themselves against the boats that pursued them. The canoe being thus taken without any opposition, was carried aboard, where the admiral blessed God, for that it had pleas'd him at once to give him samples of the commodities of that country, without exposing his men to any danger. He therefore order'd such things to be taken, as he judg'd most lightly and

7 P valuable

goods they  
had.

valuable; such as some quilts, and shirts of cotton, without sleeves, curiously wrought and dy'd of several colours, and some small clouts to cover their privities, of the same sort; and large sheets in which the *Indian* women aboard the canoe wrapp'd themselves, as the *Moorish* women at *Granada* us'd to do; and long wooden swords with a channel on each side, where the edge should be, in which there were sharp edges of flint fix'd with thread, and a bituminous sort of matter, which cut naked men, as if they were of steel, and hatchets to cut wood like those of stone the other *Indians* use, but that these were made of good copper; also bells of the same metal, plates, and crucibles to melt the metal. For their provision they had such roots and grain as they in *Hispaniola* eat, and a sort of liquor made of *Maiz*, like the *English* beer; and abundance of *Cacao* nuts, which in *New Spain* pass for money, which they seemed to value very much; for when they were brought aboard among their other goods, I observ'd that when any of these nuts fell, they all stoop'd to take it up, as if it had been a thing of great consequence: yet at that time they seem'd to be in a manner besides themselves, being brought prisoners out of their canoe aboard the ship, among such strange and fierce people, as we are to them; but

so prevalent is avarice in man, that we ought not to wonder that it should prevail upon the *Indians* above the apprehension of the danger they were in. I must add, that we ought to admire their modesty; for it falling out, that in getting them aboard, some were taken by the clouts they had before their privities, they would immediately clap their hands to cover them; and the women would hide their faces, and wrap themselves up as we said the *Moorish* women do at *Granada*. This mov'd the admiral to use them well, to restore their canoe, and give them some things in exchange for those that had been taken from them. Nor did he keep any one of them but an old man, whose name was *Giumbe*, that seem'd to be the wisest and chief of them, to learn something of him concerning the country, and that he might draw others to converse with the christians, which he did very readily and faithfully all the while we sail'd where his language was understood. Therefore, as a reward for this his service, when we came where he was not understood, the admiral gave him some things, and sent him home very well pleased, which was before he came to cape *Gracias a Dios*, on the coast of *Orechia*, where of mention has been made already.

Modesty of  
the Indians.

#### CHAP. XC.

*How the admiral would not go to New Spain, but sail to the eastward to find out the streight in the continent.*

NOTwithstanding the admiral had heard so much from those in the canoe, concerning the great wealth, politeness, and ingenuity of the people westward towards *New Spain*; yet thinking that those countries lying to the leeward, he could sail thither when he thought fit from *Cuba*, he would not go that way at this time, but held on his design of discovering the streight in the continent, to clear a way into the *South Sea*, which was what he aim'd at in order to come at the countries that produce spice, and therefore resolv'd to sail eastward towards *Veragua* and *Nombre de Dios*, where he imagin'd the said streight to be, as in effect it was; yet was he deceiv'd in the matter; for he did not conceit it to be an *Isthmus*, or narrow neck of land, but a small gulph running from sea to sea. Which mistake might proceed from the likeness of the names; for when they said the streight was at *Veragua* and *Nombre de Dios*, it might be understood either of land or water; and he took it in the most usual sense, and for

that he most earnestly desir'd. And yet tho' that streight is land, yet it was and is the way to the dominion of both seas, and by which such immense riches have been discovered and convey'd; for it was God's will, a matter of such vast concern should not be otherwise found out, that canoe having given the first information concerning *New Spain*.

There being nothing therefore in those islands of *Guanaia* worth taking notice of, he without further delay sail'd in order to seek out the streight towards the continent, to a point he called *Casinas*, because there were abundance of trees that bear a sort of fruit that is rough, as a spungy bone, and is good to eat, especially boil'd; which fruit the *Indians* of *Hispaniola* call *Casinas*. There appearing nothing worth taking notice of all about that country, the admiral would not lose time to go into a great bay the land makes there, but held on his course eastwards along that coast, which runs along the same way to cape *Gracias a Dios*, and

and is very low and open. The people nearest to cape *Casinas*, wear those painted shirts or jerkins before-mentioned, the clouts before their privities, which were like coats of mail made of cotton strong enough to defend them against their weapons, and even to bear off the stroke of some of ours.

But the people higher eastward towards cape *Gracias a Dios*, are almost black, of a fierce aspect, go stark naked, are very savage, and as the *Indian* that was taken, said, eat mens flesh, and raw fish just as it is taken. They have their ears bored with such large holes, that they may put a hens egg into them, which made the admiral call that coast *de las Orejas*, or of the Ears. There on Sunday the fourteenth of August 1502, *Bartolomeu Columbus* went ashore in the morning with the colours, the captains, and many of the men, to hear mass; and on Wednesday following, when the boats went ashore to take possession of the country for their catholic majesties, above a hundred men ran down to the shore, loaded with provisions; who as soon as the boats came ashore came before the lieutenant, and on a sudden retired back without speaking a word. He ordered they should give them horse-bells, beads, and other things; and by means of the aforesaid interpreter, inquired concerning the country; tho' he having been but a short time with us, did not understand the christians, by reason of the distance of his country from *Hispaniola*, where several persons aboard the ships had learnt the *Indian* language. Nor did he understand those *Indians*; but they being pleased

with what had been given them, came the next day to the same place, above two hundred of them loaded with several sorts of provisions, as hens of that country, which are better than ours, geese, roasted fish, red and white beans, like kidney beans, and other things like those they have in *Hispaniola*. The country was green and beautiful, tho' low, producing abundance of pines, oaks, palm-trees of seven fots, and *Mirabalans* of those of *Hispaniola* they call *Hobi*, and almost all sorts of provisions that island affords were here to be found. Abundance of leopards, deer, and other sorts of fish there are in the islands and in *Spain*. The people of this country are much like those of the islands, but that their foreheads are not so high, nor do they seem to have any religion. There are several languages among them, and for the most part they go naked, but cover their privities; some wear short jumps down to their navel without sleeves, their arms and bodies have figures wrought on them with fire, which make them look oddly; and some have lions, others deer, and others castles with towers, and other things painted on their bodies. Instead of caps, the better sort of them wear red and white cloths of cotton; and some have locks of hair hanging on their foreheads. But when they are to be fine against a festival day, they colour their faces, some black, and some red; others draw streaks of several colours; others paint their nose, and others black their eyes; and thus they adorn themselves to appear beautiful, whereas in truth they look like devils.

## CHAP. XCL

*How the admiral left the coast called de las Orejas, and by cape Gracias a Dios, came to Cariari, and what he did and saw there.*

THE admiral sailed along the said coast *de las Orejas* eastward to cape *Gracias a Dios*, which was so called, because there being but sixty leagues to it from cape *Casinas*, we laboured seventy days by reason of the currents and contrary winds upon the tack to gain it, standing out to sea, and then making the shore, sometimes gaining and sometime losing ground, as the wind was scant or large when we came about. And had not the coast afforded such good anchoring we had been much longer upon it; but being clear, and having two fathom water half a league from the shore, and two more at every leagues distance; we had always the conveniency of anchoring at night when there was but little wind, so that the course was navigable by reason of the good anchoring, but with difficulty.

1

When on the fourteenth of September we came up to the cape, perceiving the land turned off to the south, and that we could conveniently continue our voyage with those *Levant* winds that reigned there, and had been so contrary to us, we all in general gave thanks to God, for which reason the admiral called this cape *Gracias a Dios*. Cape *Gracias a Dios*. A little beyond it, we passed by some dangerous sands that ran out to sea, as far as the eye could reach.

It being requisite to take in wood and water; on the sixteenth of September, the admiral sent the boats to a river that seemed to be deep, and to have a good entrance, but the coming out proved not so; for winds freshing from sea, and the waves running high against the current of the river, so distressed the boats, that one of them

was

was lost with all the men in it, wherefore the admiral called it the river *de la Degradia*, that is, of the disaster.

In this river and about it, there were canes as thick as a man's leg; and on *Sunday* the twenty fifth of *September*, still running southward, we came to an anchor near a little island called *Quiriviri*, and a town on the continent, the name whereof was *Cariari*, where were the best people, country, and situation, we had yet seen; as well because it was high, full of rivers, and abounding in trees, as because the island was thick wooded, and full of forests of palm, mirabilan, and other sorts of trees. For this reason, the admiral called it *Hucite*. It is a small league from the town the *Indians* call *Cariari*, which is near a great river, whither resorted a great multitude of people from the adjacent parts, some with bows and arrows, others with staves of palm-tree, as black as a coal, and hard as a horn, pointed with the bones of fishes, others with clubs; and they came together as if they meant to defend their country. The men had their hair braided and wound about their heads; the women short like ours. But perceiving we were peaceable people, they were very desirous to barter their commodities for ours, theirs were arms, cotton-jerkins, and large pieces like sheets, and *Guanines*, which is pale gold, they wear about their necks, as we do relics. These things they swam with to the boats, for the christians went not ashore that day nor the next; nor would the admiral allow any thing of theirs to be taken, that we might not be taken for men that value their goods, but gave them some of ours. The less they saw us value the exchange, the more eager they were, making abundance of signs from land. At last, perceiving no body went ashore, they took all the things that had been given them, without reserving any, and tying them together, left them in the same place where the boats first went ashore, and where our men found them on the *Wednesday* following when they landed. The *Indians* about this place, believing, that the *Christians* did not confide in them, they sent an ancient man of an awful presence with a flag upon a staff, and two girls, the one about eight, the other about fourteen years of age, who putting them into the boat, made signs that the christians might safely land. Upon their request, they went ashore to take in water, the *Indians* taking great care not to do any thing that might fright the christians, and when they saw them return to their ships, they made signs to them to take along with them the young girls with their *Guanines* about their necks, and at the request of the old man that con-

ducted them, they complied and carried them aboard. Wherein those people showed more friendly than others had done; and in the girls appeared an undauntedness. For tho' the christians were such strangers to them, they express no manner of concern, but always looked pleasant and modest, which made the admiral treat them well, clothed, fed, and set them ashore again, where the fifty men were, and the old man that had delivered them received them again with much satisfaction. The boats going ashore again that same day, found the same people with the girls, who restored all the christians had given them. The next day the admiral's brother going ashore to learn something of those people, two of the chief men came to the boat, and taking him by the arms between them, made him sit down upon the grass; and he asking some questions of them, ordered the secretary to write down what they answered; but they seeing the pen, ink, and paper, were in such a consternation, that most of them ran away, which, as was believed, they did for fear of being bewitched; for to us they seemed to be sorcerers, or superstitious people, and that not without reason; because, when they came near the christians they scattered some powder about them in the air, and burning some of the same powder endeavoured to make the smoke go towards the christians; besides, their refusing to keep any thing that belonged unto us, shewed a jealousy, for, as they say, *a knave thinks every man like himself*. Having staid here longer than was convenient, considering the haste we were in, after repairing the ships, and provided all we wanted, upon *Sunday* the second of *October*, the admiral ordered his brother to go ashore with some men to view that *Indian* town, and learn something of their manners, and the nature of the country. The most remarkable things they saw were, in a great wooden palace covered with canes, several tombs, in one of which there was a dead body dry'd up and embalmed; in another, two bodies, wrapped up in cotton sheets without any ill scent; and over each tomb, was a board with the figures of beasts carved on it; and on some of them, the effigies of the person buried there, adorned with *Guanines*, beads, and other things they most value. These being the most civilized *Indians* in those parts, the admiral ordered one to be taken, and learn of him the secrets of the country; and of seven that were taken, two of the chiefest were picked out, and the rest sent away with some gifts, and civil entertainment, that the country might not be left in an uproar, telling them, they were to serve as guides

guides upon that coast, and then be set at liberty. But they believing they were taken out of covetousness, that they might ransom themselves with their goods and things of value, the next day abundance of them came down to the shore, and sent four aboard the admiral, as their ambassadors, to treat about the ransom, offering some things, and freely giving two hogs of the country, which tho' small, are very wild. The admiral therefore observing the policy of this people, was more desirous to be acquainted with them, and would not depart till he had learnt something of them, but would not give ear to their offers. He therefore ordered some trifles to be given to the messengers, that they might not go away dissatisfied, and that they should be paid for their hogs, one of which was hunted after this manner. Among other creatures that country produces, there is a kind of cats of a greyish colour, and as big as a small greyhound, but have a longer tail, and so strong, that whatsoever they clap it about is as it were tied with a rope. These run about the trees like the squirrels, leap-

ing from one to another; and when they leap, they do not only hold fast with their claws, but with their tail too, by which they often hang, either to rest them, or sport. It happened that one *Ballester* brought one of these cats out of a wood, having knocked him off a tree, and not daring to meddle with it when down, because of its fierceness, he cut off one of his fore legs, and carrying it so wounded aboard; it frightened a good dog they had; but put one of the hogs they had brought us into a much greater fear; for as soon as the swine saw the cat, it run away, with signs of much dread, which we were surprized at; because before this happened, the hog ran at every body, and would not let the dog rest upon the deck. The admiral therefore ordered it to be put close to the cat, which presently wound her tail about its snout, and with that fore-leg it had left, fastened on its pole to bite it, the hog for fear grunting most violently. By this we perceived that these cats hunt like the wolves or dogs in *Spain*.

# C H A P. XCII.

*How the admiral went from Cariari, to Caravaro and Veragua, till he came to Portavelo, all along a very fruitful coast.*

Bay of Caravaro.

UPON Wednesday the 5th of October, the admiral sailed, and came to the bay of *Caravaro*, which is six leagues in length, and above three in breadth, where there are many small islands, and two or three channels to get in or out at any time. Within these islands the ships sail as it were in streets between islands, the leaves of the trees striking against the shrouds. As soon as we anchored in this bay, the boats went to one of the islands, where there were twenty canoes upon the shore, and the people by, as naked as they were born, and had only a gold plate about their neck, and some an eagle of gold. These, without showing any tokens of fear, the two *Indians* of *Cariari* interpreting, gave a gold plate for three horse-bells; it weighed ten ducats, and they said there was great plenty of that metal up the continent not far from them.

The next day being the seventh of October, the boats went ashore upon the continent, where meeting ten canoes full of people, and they refusing to chaffer away their gold plates, two of the chief of them were taken, that the admiral might learn something of them with the assistance of two interpreters. The gold plate one of them wore weigh'd fourteen ducats, and the other's eagle

twenty two. These said, that a day or two's journey up the country, there was abundance of gold found in some places which they named. In the bay a vast deal of fish was taken, and ashore there were abundance of those creatures above-mentioned at *Cariari*; also great plenty of their food, such as roots, grain, and fruit. The men, who are painted all over face and body of several colours, as red, black and white, go naked, only covering their privities with a narrow cotton cloth.

From this bay of *Caravaro*, we went to another close by it, called *Aburena*, which in some measure is like the other.

On the seventeenth we put out to sea to continue our voyage; and being come to *Guaiga*, a river twelve leagues from *Aburena*, the admiral commanded the boats to go ashore, which as they were doing, they saw above a hundred *Indians* on the strand, who vaulted them furiously, running up to the middle into the water, brandishing their spears, blowing horns, and beating a drum in warlike manner, to defend their country, throwing the salt water towards the christians, chewing herbs and spurning it towards them. Our men not stirring endeavoured to appease them, as they did, for at last they drew near to exchange the gold

Product of the coast.  
try.

Aburena.

plates

Vol. I.

7 Q

plates they had about their necks, some for two, and some for three horse bells, by which means we got sixteen gold plates, worth a hundred and fifty ducats. The next day being *Friday* the nineteenth of *October*, the boats went to land again to barter; yet before any christian went ashore, they called to some *Indians*, who were under some bowers they had made that night to defend their country, fearing the christians would land to do them some wrong. Tho' they called never so much, yet none of them would come, nor would the christians land without knowing first what mind they were in: for, as afterwards appeared, they waited in order to fall on them as soon as they landed. But perceiving they came not out of the boats, they blew their horns, beat the drum, and making a great noise, ran into the water, as they had done the day before, till they came almost to the boats, making signs as if they would cast their javelins if they did not return to their ships. The christians offended at this their proceeding, that they might not be so bold, and despise them, wounded one with an arrow in the arm, and fired a cannon, at which they were so frightened, that all ran away to land. Then four christians landed, and calling them back, they came very peaceably, leaving their arms behind them, and exchanged three gold plates, saying, they had no more, because they came not provided for to trade, but to fight.

Catiba.

All the admiral looked for in this journey, was to get samples of what those parts afforded; and therefore without farther delay, he proceeded to *Catiba*, and cast anchor in the mouth of a great river. The people of the country were seen to gather, calling one another with horns and drums; and afterwards sent a canoe with two men in it to the ships, who having talked with the *Indians* that were taken at *Cariari*, presently came aboard the admiral without any apprehension of fear; and by the advice of those *Indians*, gave the admiral two plates of gold they had about their necks, and he in return gave them some baubles of ours. When these were gone ashore, there came another canoe with three men

wearing plates hanging at their necks, who did as the first had done. Amiry thus settled, our men went ashore, where they found abundance of people with their king, who differed in nothing from the rest, but that he was covered with one leaf of a tree, because at that time it rained hard; and to give his subjects a good example, he exchanged a plate, and bid them barter for theirs; which in all were nineteen of pure gold. This was the first place in the *Indies* where they saw any sign of a structure, which was a great mass of wall, or imagery, that to them seemed to be of lime and stone; the admiral ordered a piece of it to be brought away as a memorial of that antiquity.

He went away eastward, and came to *Cobravo*, the people of which place lie near the rivers of that coast; and because none came down to the strand, and the wind blew fresh, he held on his course, and went on to five towns of great trade, among which was *Veragua*, where the *Indians* said the gold was gathered and the plates made.

The next day he came to a town, called *Cubiga*, where the *Indians* of *Cariari* said the trading country ended, which began at *Carakora*, and ran as far as *Cubiga*, for fifty leagues along the coast.

The admiral without making any stay, went on till he put into *Porto Bello*, giving it that name, because it is large, beautiful, well-peopled, and encompassed by a well cultivated country. He entered this place on the second of *November*, passing between two small islands, within which the ships may lie close to the shore, and turn it out if they have occasion. The country about that harbour higher up, is not very rough, but tilled and full of houses, a stone's throw or a bow shot one from the other; and it looks like the finest landskip a man can imagine. During seven days we continued there on account of the rain and ill weather, there came continually canoes from all the country about to trade for provisions, and bottoms of fine spun cotton which they gave for some trifles, such as points and pins.

Retrete very fine port.

## C H A P. XCIII.

*How the admiral came to port Bastimentos, or Nombre de Dios, and continued his voyage till he put into Retrete.*

ON *Wednesday* the 9th of *November*, we sail'd out of *Porto Bello*, eight leagues to the eastward; but the next day were forced back four leagues by stress of weather, and put in among the islands near the con-

tinent, where is now the town of *Nombre de Puerto de Dios*; and because all those small islands were full of grain, he call'd it, *Puerto de Bastimentos*, that is, the port of provisions.

port of provisions.

There

There a boat well mann'd, pursuing a  
canoe, the Indians imagining our men  
would do them some harm, and perceiving  
the boat was within less than a stone's throw  
of them, they all threw themselves into  
the water to swim away, as in effect they  
did; for tho' the boat row'd hard, it  
could not in half a league the pursuit last-  
ed, overtake any of them; or if it did  
happen to overtake one, he would dive like  
a duck, and come up again a bow-shot or  
two from the place. This chase was very  
pleasant, seeing the boat labour in vain,  
which at last returned empty.

Here we continued till the 23d of No-  
vember, refitting the ships, and mending  
our cask; and that day we sailed eastward  
to a place called *Guiga*, there being ano-  
ther of the same name between *Veragua*  
and *Cerago*. The boats going ashore,  
found above 300 persons on it, ready to  
trade for such provisions as they have, and  
some small things of gold they wore hang-  
ing at their ears and noses.

Retrete, a  
very small  
port.

But without making any stay here, on  
*Saturday* the 24th of November, we put in-  
to a small port, which was called *Retrete*,  
that is, retir'd place, because it could not  
contain above five or six ships together,  
and the mouth of it was not above 15 or  
20 paces over, and on both sides of it rocks  
appearing above water as sharp as dia-  
monds; and the channel between them was  
so deep that they found no bottom, tho' if  
the ships inclin'd never so little to either  
side, the men might leap ashore, which  
was it that sav'd the ships in that narrow  
place, which was the fault of those who  
went in the boats to view it, they being co-  
vetous to deal with the Indians, and per-  
ceiving the ships would lie there convenient-  
ly for it, close to the shore. In this place  
we continued nine days with bad weather;  
and at first the Indians came very familiarly  
to trade for such as they had, but when they  
saw the christians steal privately out of their

ships they retir'd to their houses, because  
the seamen like covetous, dissolute men,  
committed a thousand infolencies; inso-  
much that they provok'd the Indians to  
break the peace, and some skirmishes hap-  
ned between them. They increasing daily, *War with*  
Indians.  
took courage to come up to the ships, which,  
as we said, lay with their sides close to the  
shore, thinking to do some harm, which  
design of theirs had turn'd to their own de-  
triments, had not the admiral always en-  
deavour'd to gain them by patience and  
civility: but at last, perceiving their inso-  
lence, to strike a terror into them, he caus'd  
some pieces of cannon to be fir'd, which  
they answer'd with shouts, threshing the  
trees with staves, and threatening by signs,  
shewing they did not fear the noise, for  
they thought it had been only a thundering  
to terrify them. Therefore to abate their  
pride, and make them not condemn the  
christians, the admiral caus'd a shot to be  
made at a company of them that was got  
together upon a hillock, and the ball fall-  
ing in the midst of them, made them sen-  
sible there was a thunderbolt as well as  
thunder; so that for the future they durst  
not appear, even behind the mountains.  
The people of this country were the pro-  
perest they had yet seen among the Indians,  
for they were tall and spare, without any  
great bellies, and well countenanced.

The country was all plain, bearing little  
grafs, and a few trees; and in the harbour  
there were vast great *Crocodiles* or *Alliga-*  
tors, which go out to stay and sleep ashore,  
and scatter a scent as if all the musk in the  
world were together; but they are so raven-  
ous and cruel, that if they find a man  
sleeping, they drag him to the water to de-  
vour him, tho' they are fearful and coward-  
ly when attack'd. These *Alligators* are  
found in many other parts of the continent,  
and some do affirm they are the same as the  
*Crocodiles* of Nile.

Alligatora.

*How the admiral being drove by stress of weather, stood again to westward, to get intelligence concerning the mines, and enquire concerning Veragua.*

ON Monday the 5th of December, the  
admiral perceiving the violent east  
and north-east winds did not cease, and  
that there was no trading with those people,  
he resolv'd to go back, to be satisfied con-  
cerning what the Indians said of the mines  
of *Veragua*, and therefore that day he re-  
turn'd to *Porto Bello*, ten leagues westward;  
and continuing his course the next day, was  
assaulted by a west wind, which was oppo-  
site to his new design, but favourable to

that he had for three months past. But he  
believing this wind would not last long, did  
not alter his course, but bore up against the  
wind for some days, because the weather  
was unsettled; and when the weather seem'd  
a little favourable to go to *Veragua*, ano-  
ther wind would start up and drive him to-  
wards *Porto Bello*; and when we were most  
in hopes to get into port, we were quite  
beat off again, and sometimes with such  
thunder and lightning, that the men durst

not

tempests  
for many  
days.

not open their eyes, the ships seem'd to be just sinking, and the sky to come down. Sometimes the thunder was so continued, that it was concluded, some ship fired its cannon to desire assistance. Another time there would fall such storms of rain, that it would last violently for two or three days, insomuch that it look'd like another universal deluge. This perplex'd all the men, and made them almost despair, seeing they could not get half an hour's rest, being continually wet, turning sometimes one way, and sometimes another, struggling against all the elements, and dreading them all; for in such dreadful storms, they dread the fire in flashes of lightning, the air for its fury, the water for the terrible waves, and the earth for the hidden rocks and sands which sometimes a man meets with near the port, where he hop'd for safety, and not knowing them, chafes rather to contend with the other elements in whom he has less share.

Besides all these terrors, there occur'd another no less dangerous and wonderful, which was a spout rising from the sea, on Tuesday the 13th of December, which if they had not dissolv'd by saying the gospel of St. John, it had certainly sunk whatsoever it fell upon; for as has been said, it draws the water up to the clouds like a pillar, and thicker than a butt, twisting it about like a whirlwind. That same night we lost sight of the ship called *Caimo*, and had the good fortune to see it again after three dreadful dark days, though it had lost its boat, and been in great danger, being so near land as to cast anchor, which it lost at long run, being forced to cut the cable. Now it appeared that the currents on that coast follow the wind, running westward with the east-wind, and the contrary, the water still going after the prevailing wind. The ships being now almost shattered to pieces with the tempest, and the men quite spent with labour, a day or two's calm gave them some respite, and brought such multitudes of sharks about the ships, that they were dreadful to behold, especially for such as are superstitious; because, as it is reported, that ravens at a great distance smell out dead bodies; so some think these sharks do, which if they lay hold of a man's arm or leg, cut it off like a razor, for they have two rows of teeth in the nature of a saw. Such a multitude of these was killed with the hook and chain, that being able to destroy no more, they lay swimming upon the water, and they are so greedy, that they do not only bite at carrion, but may be taken with a red rag upon the hook. I have seen a tortoise taken out of the belly of one of these

Multitudes  
of sharks.

sharks, and it afterwards liv'd aboard the ship; but out of another was taken the whole head of one of his own kind, we having cut it off and thrown it into the water, as not good to eat, no more than they are themselves, and that shark had swallowed it; and to us it seem'd contrary to reason, that one creature should swallow the head of another of its own bigness, which is not to be admired, because their mouth reaches almost to their belly, and the head is shaped like an olive. Tho' some look'd upon them to forebode mischief, and others thought them bad fish, yet we all made much of them, by reason of the want we were in, having been now above 8 months at sea, so that we had consum'd all the fish and flesh brought from *Spain*; and what with the heat and moisture of the sea, the biscuit was so full of maggots, that, as God shall help me, I saw many that staid till night to eat the portage or brevice made of it, that they might not see the maggots; and others were so us'd to eat them, that they did not mind to throw them away when they saw them, because they might lose their supper if they were so very curious.

Upon Saturday the 17th, the admiral put into a port 3 leagues east of *Pennon*, which the *Indians* called *Huiva*. It was like a great bay, where we rested 3 days, and going ashore, saw the inhabitants dwell upon the tops of trees, like birds, laying sticks across from bough to bough, and building huts upon them, rather than houses. Tho' we knew not the reason of this strange custom, yet we guess'd it was done for fear of the griffins there are in that country, or of enemies; for all along that coast, the people at every league distance are great enemies to one another.

We sailed from this port on the 20th with fair weather, but not settled; for as soon as we were got out to sea, the tempest began to rage again, and drove us into another port, whence we departed again the third day, the weather seeming somewhat mended, but like an enemy that lies in wait for a man, rush'd out again, and forced us to *Pennon*, where when we hop'd to put in, the wind started up so contrary, that we were drove again towards *Veragua*. Being at an anchor in the river, the weather became again so stormy, that all the favour we had from it, was, that it allowed us to get into that port, where we had been before on Thursday the 12th of the same month. Here we continued from the 2d day in *Christmas*, till the 3d of *January* the following year 1503. when having repair'd the ship called *Gallega*, and taken aboard abundance of *Indian* wheat, water,

change of  
matters.

and wood, we turn'd back towards *Veragua* with bad weather, and contrary winds, which chang'd crossly, just as the admiral alter'd his course. And this was so strange and unheard of a thing, that I would not have repeated so many changes, if, besides by being then present, I had not seen the same written by *James Mendez*, who sail'd with the canoes of *Jamaica*, whereof I shall speak hereafter, and writ an account of this voyage; and the letter the admiral sent by him to their catholic majesties, which is printed, will inform the reader how great our sufferings were, and how much torture persecuted him the ought most to favour. But to return to the changes of weather, and of our course, which put us to so much trouble between *Veragua* and *Porto Bello*, for which reason, that coast was called *Costa de Contraffes*, that is, coast of thwartings.

Upon *Thursday*, being the feast of the *Epiphany*, we cast anchor near a river, which the *Indians* call *Yebra*, and the admiral nam'd *Belem*, or *Betlem*, because we came to that place upon the feast of the three kings. He caus'd the mouth of that river, and of another westward, to be

founded; the latter the *Indians* call *Veragua*, where he found but shoal water, and in that of *Belem*, 4 fathom at high water. The boats went up this river to the town, where they were inform'd the gold mines of *Veragua* were. At first the *Indians* were so far from conversing, that they assembled with their weapons, to hinder the christians landing. The next day, our boats going to the river of *Veragua*, the *Indians* there did as the others had done, and that not only ashore, but stood upon their guard with their canoes in the water. But an *Indian* of that coast, who understood them a little, going ashore with the christians, and telling them, we were good people, and desir'd nothing but what we paid for, they were somewhat pacified, and truck'd 20 gold plates, some hollow pieces like joints of reeds, and some grains never melted; which to make their value the more, they said were gathered a great way off upon uncouth mountains; and that when they gather'd it, they did not eat, nor carry women along with them, which some thing the people of *Hispaniola* said, when it was first discovered.

Indian po-  
lity.

# C H A P. XCV.

*How the admiral went into the river of Belem, and resolv'd to build a town there and leave his brother the lieutenant in it.*

Terrible  
the Indians.

ON monday the 9th of *January*, the admiral's ship, and that called *Biscaina*, went up the river, and the *Indians* came presently to truck for such things as they had, particularly fish, which at certain times of the year comes out of the sea up these rivers in such quantities as seems incredible to such as do not see it; and they exchange'd some little gold for pins, and those things they most valued they gave for beads or hawks-bells. Next day the other two ships came in, which they had not done at first, because there being but little water at the mouth of the river, they were forced to stay for the flood; tho' there the sea never rises or falls above half a fathom.

*Veragua* being fam'd for mines and extraordinary wealth, the third day after our arrival, the admiral's brother went up the river with the boats to the town of *Quibio*, so the *Indians* call their king, who hearing of the lieutenant's coming, came down the river in his canoes to meet him. They met in very friendly manner, giving one another interchangeably such things, as they valu'd most, and having discours'd a long time together, every one went away peaceably. Next day the said *Quibio* came aboard

to visit the admiral, and having discours'd together about an hour, the admiral gave him some things, and his men truck'd bells for some gold, and so he return'd without any ceremony the same way he came.

We being thus very easie and secure, on *Wednesday* the 24th of *January*, the river of *Belem* suddenly swell'd so high, that before we could provide against it, or carry a cable ashore, the fury of the water came so impetuously against the admiral's ship, that it broke one of its two anchors, and drove her with such force against the ship *Gallega*, which lay a-stern of it, that it brought the foremast by the board, and were both carried away foul of one another in utmost danger of perishing. Some judg'd the mighty rains to have been the cause of this mighty flood, they having never ceas'd all the winter in that country; but had that been it, the river would have swell'd by degrees, and not all on a sudden, which made it be believed some great shower had fallen on the mountains of *Veragua*, which the admiral called *St. Christopher's*, because the highest of them was above the region of the air, where meteors are bred; for no cloud was ever seen above, but all

A danger-  
ous sudden  
flood.

below it. To look to, it is like an hermitage, and lies at least 20 leagues up the country, in the midst of woody mountains, whence we believed that flood came which was so dangerous, that tho' it brought water enough to carry the ships out to sea, the wind was then so boisterous, that they must have been shatter'd to pieces at the mouth of the river, distant half a mile from whence they broke loose. This tempest lasted so long, that we had time enough to refit and caulk the ships. The waves broke so furiously upon the mouth of the river, that the boats could not go out to discover along the coast, to learn where the mines lay, and chuse a place to build a town; the admiral having resolved to leave his brother there with most of the men, that they might settle and subdue that country, whilst he went to *Spain* to send supplies of men and provisions: Upon this prospect, the weather growing calmer, on Monday the 6th of February, he sent his brother with 68 men by sea to the mouth of *Veragua* river, a league distant from *Belem* westward, and he went a league and a half up the river, to the *Cacique's* town, where he

staid a day enquiring out the way to the mines.

On Wednesday they travel'd four leagues and a half and came to lie near a river, which they pass'd 44 times, and the next day advanced a league and a half towards the mines, show'd them by *Indians* sent by *Quibio* to guide them. In two hours time after they came thither, every man gather'd some gold about the roots of the trees, which were there very thick, and of a prodigious height. This sample was much valued, because none of those that went had any tools to dig, or had ever gather'd any. Therefore the design of their journey being only to get information of the mines, they return'd very well pleas'd that same day to *Veragua*, and the next to the ships. True it is, that, as was afterwards known, these mines, were not those of *Veragua*, which lay much nearer, but of *Urira*, a town whose people are enemies to those of *Veragua*, to do whom a displeasure, *Quibio* ordered the christians to be conducted thither, and that they might go away to those and leave his.

#### C H A P. XCVI.

*How the admiral's brother went to see some towns of that province; with an account of the country, and customs of those people.*

ON Thursday the 14th of February 1503, the admiral's brother went into the country with 40 Men, a boat following with 14. The next day they came to the river of *Urira*, 7 leagues from *Belem* westward. The *Cacique* came out a league from his town to meet him, with 20 Men, and presented him with such things as they feed on, and some gold plates were exchange'd here. Whilst they were here, the *Cacique*, and chief men, never ceased putting a dry herb into their mouths and chewing it, and sometimes they took a sort of powder they carried with that herb, which looks very odd. Having rested here a while, the christians and *Indians* went together to the town, where abundance of people came out to them, and assign'd them a great house to lie in, giving them much to eat. Soon after came the *Cacique* of *Dururi*, which is a neighbouring town, with a great many *Indians*, who brought some gold plates to truck; all these *Indians* said, there were *Caciques* up the country, who had plenty of gold, and abundance of men arm'd like ours. Next day, the lieutenant ordered the rest of his men to return by land to the ships, and he with thirty, he kept with him, held on his journey to-

wards *Zabraba*, where the fields for above 6 leagues were all full of *Maiz*, like corn-fields. Thence he went to *Cateba*, another town; at both places he was well entertained, abundance of provisions given him, and some gold plates truck'd, which, as has been said, are like the paten of a chalice, some bigger and some less, weighing 12 ducats more or less; they wear them about their necks, hanging by a string, as we do relics. The lieutenant being now very far from the ships, without finding any port along that coast, or any river bigger than that of *Belem* to settle his colony, he came back the same way on the 24th of February, bringing above — ducats in gold he had exchanged for. As soon as he return'd, presently order was taken for his stay, and 80 men being appointed to remain with him, they agreed by ten and ten, or more or less in a gang, and began to build houses upon the bank of the aforesaid river of *Belem*, about a cannon shot from the mouth of it, within a trench that lies on the right hand, coming up the river, at the mouth of which there is a little hill. Besides these houses, which were all of timber, and covered with palm-tree leaves, which grew along the shore, another large house

house was built, to serve as a storehouse and magazine, into which several pieces of cannon, powder, and provisions were put, and other necessities for the support of the planters. But for wine, biscuit, oil, vinegar, cheese, and much grain, which was all they had to eat, these things were left in the safest place, aboard the ship called *Gallega*, that was to be left with the lieutenant, that he might make use of it either at sea, or ashore, having all its cordage, nets, hooks, and other fishing tackle; for as we have said, there is vast plenty of fish in that country in every river, several fairs at certain times running along the coast in shoals, on which the people of the country feed more than upon flesh; for tho' there be some sorts of beasts they are not enough to maintain them. The customs of these *Indians* are for the most part much like those of *Hispaniola*, and the neighbouring islands; but these people of *Veragua*, and the country about it, when they talk to one another, and eat, turn their backs, and are always chewing an herb, which we look upon to be the occasion that their teeth are decay'd and rotten. Their food is fish, which they take with nets and hooks made of tortoise-shell, which they cut with a thread, as if they were sawing; the same they use in the islands. They have another way of catching some very small fishes, which in *Hispaniola* they call *Titi*. These at certain times being drove to the shore by the rains, are so persecuted by the bigger fish, that they are forced up to the surface of the water, where the *Indians* take as many as they will of them in little mats, or small nets, and wrap them up in leaves of trees, as apothecaries do their drugs; and having dried them in an oven, they keep a long time. They also catch pilchards almost in the same manner; for at certain times these fishes fly from the great ones so violently, and in such fear, that they leap out two or three paces upon the dry land, so that there is no more to do, but to take them as they do the others. These pilchards

are taken after another manner; for in the middle of their canoes, from stem to stern, they raise a partition of palm-tree leaves two yards high, and plying about the river they make a noise, and beat the shore with their oars, and then the pilchards, to fly from the other fish, leap into the canoe, and hitting against those leaves fall in, by which means they take as many as they please. Several sorts of fish pass along the coast in shoals, whereof wonderful quantities are taken, which they keep roasted a long time. They have also abundance of *Maiz*, which is a sort of grain growing in Indian an ear, or hard head like *millet*, whereof <sup>Indians</sup> wine. they make white and red wine, as beer is made in *England*, and mix of their spice with it as pleases their palate; it has a pleasant taste like a sharp brisk wine: they also make another sort of wine of certain trees like palms; and I believe they are of that kind, but that they are smooth, and have such prickles on the trunk as the thorn. From the pith of this palm, which is like palm-toes squeez'd, they draw a juice, whereof they make wine, boiling with it water and spice; and this they make great account of. They make another wine of the fruit we said is found in the island *Guanadalupe*, which is like a great pine-apple: It is planted in great fields, and the plant is a sprout growing out at the top of the fruit itself, like that which grows out of a cabbage or lattice. One plant lasts three or four years, and bears. They make wine of other sorts of fruit, particularly of one that grows upon very high trees, and is as big as a large limon, and every one has two, three, and some nine stones like nuts, but they are not round, but long, or like a chestnut. The rind of this fruit is like a pomegranate, and when first taken from the tree it resembles it exactly, save only that it wants the prickly circle at the top. The taste of it is like a peach: Of these some are better, some worse, as is usual among other fruit. There are of them in the islands, and the *Indians* call them *Mamei*.

# C H A P. XCVII.

*How for the greater security of the christian colony, Quibio, and several of the principal men were made prisoners, and how through the carelessness of his keepers, he made his escape.*

The mouth  
of the ri-  
ver choak'd  
up with  
sand.

ALL things were now settled for the christian colony, and ten or twelve houses built and thatched, and the admiral ready to sail for *Spain*, when he fell into greater danger for want of water, than he had been before by the inundation. For the great rains of *January*, being over,

the mouth of the river was so choaked up with sand, that whereas when they came in, there was about ten foot water, which was scant enough, when we would have gone out there were not two foot, so that we were shut up without any help, it being impossible to get the ships over the sand,

sand; and though there had been such an engine, the sea was so boisterous, that the least wave which beats upon the shore was enough to beat the ships in pieces, especially ours, which were at this time like a honey-comb, being all worm-eaten through and through. We had nothing left but to have recourse to God, and beg rain of him, as before we pray'd for fair weather; for the rain we knew would swell the river, and clear the sand from the mouth of it, as is usual in those rivers. It being in the mean while discovered by means of the interpreter, that *Quibio*, the *Cacique* of *Veragua* intended to set fire to the houses and destroy the christians, because all the *Indians* were against their planting upon that river; it was therefore thought fit, as a punishment to him, and a terror and example to others, to make him a prisoner with all his chief men, and send them into *Spain*, and that his town should remain at the disposal of the christians.

To this purpose, the lieutenant on the 30th of *March*, went with 76 men to the town or village of *Veragua*; and because I call it a town or village, it is to be observed that in those parts their houses are not close together, but they live as in *Biscay* at some distance from one another. When *Quibio* understood that the lieutenant was come near, he sent him word not to come up to his house, which stood upon a hill above the river of *Veragua*; and the lieutenant, that he might not fly for fear of him, resolved to go with only five men, ordering those he left behind to come after him, two and two, at some distance from one another; and when they heard a musquet fired, they should beset the house, that none might escape. Being come up to the house, *Quibio* sent another messenger, bidding him not go in, for he would come out to talk to him, tho' he was wounded with an arrow, which they do that their women may not be seen, being wonderful jealous of them. Accordingly he came and sat at the door, bidding only the lieutenant come near him, who did so, ordering the rest to fall on, as soon as he laid hold of his arm. He asked the *Cacique* some questions concerning his indisposition, and the affairs of the country by the assistance of an *Indian* he had, whom we had taken not far off, above three months since, and he willingly went along with us. This man was then much afraid, for knowing that *Quibio* design'd to destroy all the christians, and not knowing our strength, he thought that might easily be done by the great multitude of people there was in that province. But the lieutenant minded not his fear, and pretending to look where

the *Cacique* was wounded, he took him by the arm, and tho' they were both very strong, yet the lieutenant took such good hold, that he lost it not till the other four came up, which done, one of them fired a musquet, and on a sudden all the christians running out of their ambush, beset the house, in which there were thirty people great and small, most of which were taken, and never a one wounded, for they seeing their king taken, would make no resistance. Among these there were some wives and children of *Quibio*, and other men of note, who offered great wealth, saying, there was a great treasure in the adjoining wood, and they would give it all for their ransom. But the lieutenant not regarding their promises, ordered *Quibio*, with his wives and children, and the principal men, to be carried aboard, before the country took the alarm, staying himself there with most of the men, to go after his kindred and subjects who were fled. Then having consulted with the captains and chief men, whom they should intrust to conduct the prisoners to the mouth of the river; he at last delivered them to *John Sanchez de Cadiz*, a pilot, and a man in good reputation, he offering to carry them, the *Cacique* being bound hands and feet; and this pilot being charged to take special care that the *Cacique* should not escape, he answered, he would give them leave to pull of his beard if he got from him. So he took him into his custody, and went down the river of *Veragua*. Being come within half a league of the mouth of it, and *Quibio* complaining that his hands were too hard bound, *John Sanchez* out of compassion, loosed him from the seat of the boat to which he was tied, and held the rope in his hand. A little after, *Quibio* observing he did not mind him, threw himself into the water; and *John Sanchez* not being able to hold fast the rope, let go that he might not draw him after into the water. Night coming on, and those in the boat being all in a confusion, they could not see or hear where he got ashore, so that they heard no more of him than if a stone had fallen into the water: That the like might not happen with the rest of the prisoners, they held on their way to the ships with much shame for their carelessness and oversight. The next day the lieutenant perceiving the country was very mountainous and woody, and that there were no regular towns, but one house here, and another at a great distance, and that it would be very difficult to pursue the *Indians* from place to place, he resolved to return to the ships with his men, not one of them being either killed or wounded. He presented

wounded. He  
presented

presented the admiral with the plunder of Quibio's house, worth about 300 ducats in gold plates, little eagles, and small quills which they string and wear about their arms and legs, and in gold twists which they put about their head in the nature of

a coronet. All which things, deducting only the 5th part for their catholick majesties, he divided among those that went upon the expedition: And to the lieutenant, in token of victory, was given one of those crowns or coronets above-mention'd.

# C H A P. XCVIII.

*How after the admiral was gone from Belem to return to Spain, Quibio assaulted the christian colony, in which engagement there were many killed and wounded.*

ALL things being provided for the maintenance of the colony, and the rules and methods for them to be govern'd by, settled by the admiral, it pleased God to send so much rain, as swelled the river and open'd the mouth of it; wherefore the admiral resolv'd to depart with all speed for *Hispaniola*, to send speedy supplies to this place. Having waited for a calm that the sea might not beat upon the mouth of the river, he went out with three ships, the boats going a-head and towing us. Yet never a one went out so cleverly, but his keel raced upon the sand, and had been in danger notwithstanding the calm but that those are loose moving sands. Then we presently took in all we had unladed to lighten the ships that they might get out. As we lay waiting for a fair wind upon the open coast, a league from the mouth of the river, it pleased God miraculously to give us an occasion of sending the admiral's boat ashore as well for water, as for other necessary affairs, that by the loss of these both those ashore, and those in the ships might be saved, which happened thus. When Quibio and the *Indians* saw that the ships were without, and could not relieve them that were left behind, they assaulted the christian colony at the same time that the boat came to the shore. They having not been discover'd by reason of the thickness of the wood, when they came within ten paces of our mens houses, fell on with great shouts, casting javelins at those they spied, and at the very houses, which being covered with palm-tree leaves, were easily struck through and through, and so sometimes they wounded those within. Having thus surprized our men thinking of no such thing, they wounded 4 or 5 before they could put themselves into a posture of defence. But the lieutenant being a man of great resolution, he went out against the enemy with a spear, encouraging his men, and falling furiously on the *Indians*, with 7 or 8 that followed him, so that he made them retire to the wood, which (as we said) was close to the houses. Thence they returned and skirmish'd, casting their javelins and then retiring, as the *Spaniards* use to do in the sport they call *Juego de Can-*

*nas*, many of them flying from the christians after they had felt the edge of their swords, and the teeth of a dog, who furiously fell in among them; so that at length they fled, having killed one christian and wounded 7, one of which was the lieutenant, who was hurt with a javelin in the breast; from which danger two christians took care to preserve themselves, which story I will relate to show the comicalness of the one, who was an *Italian of Lombardy*, and the gravity of the other who was a *Spaniard*. The *Lombard* running hastily to hide himself in a house, *James Mendez*, of whom mention will be made hereafter, said to him, turn, turn back *Sebastian*, whither are you going? He answered, let me go, you devil, for I am going to secure my person. The *Spaniard* was captain *James Triflan*, whom the admiral sent ashore in the boat, who never went out of it with his men, tho' the fray was just by the river; and being blamed by some for not assisting the christians, he answered, he said he did it that those ashore might not run to the boat and so all perish, because if the boat were lost, the admiral would be in danger at sea, and therefore he would do no more than he had been commanded, which was to take in water, and to see whether there was any need of his assistance. Resolving therefore to take in the water immediately, that he might carry the admiral an account of what had happen'd, he went up the river for it, where the sweet did not mix with the salt, tho' some advised him not to go, for the danger there was of the *Indians* and their canoes; to which he answered, he did not fear that danger, since he was sent for that purpose by the admiral. Accordingly he went up the river, which is very deep within, and shelter'd on both sides with abundance of trees, which come to the edge of the water and so thick that there is scarce any going ashore, except in some places which are the fishermen's paths, and where they hide their canoes. As soon as the *Indians* perceived he was got about a league from the colony up the river, they rushed out from the thickest on both sides the river in their canoes, and making a hideous noise, blow-

*Indians  
kill all the  
Spaniards  
in the  
boats.*

ing their horns, assaulting him boldly on all sides with great odds on their side, because their canoes being swift, and one man being enough to command and turn them which way they please, especially those that are little and belong to the fishermen, three or four men came in each of them, one of whom row'd, and the rest cast their javelins at those in the boat; I call them javelins because of their bigness, tho' they have no iron-heads, but only points of fish-bones. There being but seven or eight men in our boat who row'd, and the captain with three or four men for fight, they could not cover themselves against the many javelins they threw at them, and therefore they were forced to quit the oars to take up their targets. But there was such a multitude of Indians, who pour'd in on all sides, coming up and retiring in good order, as they thought fit, that they wounded most of the christians, especially the captain, who was hurt in many places; and tho' he stood unmoved encouraging his men, it availed him nothing; for he was beset on all sides, and could not stir, nor make use of his musquets, till at last they struck a javelin into his eye, and he fell down dead; and all the rest came to the like fate, except one *John de Noia of Sevil*, who by good luck in the height of the fray fell into the water, and diving got to the shore, and made his way through the thickest of the wood to the colony, to carry the news of what had happened. This so terrified our men, that seeing they were but a few, some of their companions being kill'd and others

wounded, and that the admiral was at sea without a boat, and in danger not to return to a place whence he might send them relief, they resolv'd not to stay there; and accordingly would have gone away immediately without any orders, had not the mouth of the river hindred, the bad weather having shut it up again; for neither could the ship they had left them get out, nor durst any boat attempt it, because the sea beat so violently, so that there was no sending the admiral advice of what had happened. He was in no less danger himself, riding in an open road, having no boat and but few men, so many having been killed: So that we were all in the same trouble and confusion, as they were within, who considering what had happened, and seeing those that had been killed in the boat drive down the river covered with wounds, and followed by the country crows, look'd upon these things as ill omens, and dreaded coming to the same end; and the more because they perceived the Indians were puff'd up with their success, inasmuch that they gave them not a minute's respite by reason of the ill situation of the colony; and there is no doubt but that they must have all suffer'd, had they not advis'd to remove to an open strand eastward, where they made a work round them with the casks and other things, and planting the cannon in convenient places defending themselves, the Indians not daring to come out of the wood, because of the mischief the bullets did among them.

## C H A P. XCIX.

*How the Indians that were kept prisoners aboard made their escape, and the admiral was informed of the success of his men.*

Some Indians swim ashore, and others hang themselves.

WHilst these things happen'd, the admiral waited ten days with much trouble, and suspecting what might fall out, till the sea would settle, that he might send another boat to know what it was that detain'd the first; but fortune thwarting him in all things, would not allow us to hear of one another; and to add to our affliction, it happened that the sons and kindred of *Quibio*, whom we kept prisoners aboard the ship *Bermuda*, to carry them to Spain, found means to escape thus. At night they were kept under hatches, and the scuttle being so high that they could not reach it, the watch forgot to fasten it with a chain as they used to do, especially because some seamen lay upon it. The prisoners therefore one night gathering the stones that were in the hold under the scuttle, and rai-

sing themselves on them, set their shoulders against it, and forced it open, tumbling those that lay on it over and over, and some of the principal men leaping out, and cast themselves into the sea. The seamen taking the alarm, many of them could not get out; and the scuttle being fastened with the chain, better care was taken; but those that remained in despair, because they could not get off with their companions, hang'd themselves with the ropes they could come at, and so were found the next morning, their feet and knees dragging upon the bottom of the hold, the place not being high enough for them to hang without touching, so that all the prisoners aboard that ship escap'd or died. Tho' this loss was not material to the ships, yet besides that it increased the number of misfortunes, it was fear'd

feard it might be hurtful to those ashore; because *Quibio* would willingly have made peace with them to get his children, and now there being no hostage left, there was cause to suspect he would make war with the greater fury. Being thus afflicted amidst so many troubles and disasters, having nothing to trust to but our anchors and cables, without knowing any thing from shore, there wanted not those, who said, that since those *Indians* only to obtain their liberty, had ventured to leap into the sea above a league from shore, they to save themselves, and so many more, would be content to swim ashore, provided that boat which remained would carry them as far as where the waves did not break. I say one boat remain'd, which was that of the ship *Bermuda*, for that of the *Biscaina*, we said before, was lost in the fray, so that they had only that one boat at present among the three ships. The admiral hearing these seamen's honest proposal, allow'd of it, and so the boat carried them within a musket shot of land, not being able to go nearer without great danger, because of the great waves that broke

on it. There one *Peter de Ledesma*, a pilot of *Sevil*, threw himself into the water, and with a good heart got to shore, where he learnt the condition our men were in, and how they all unanimously said, they would not upon any account remain there in that forlorn condition, and therefore desired the admiral not to sail till he had taken them off, for to leave them there was sacrificing of them, and the more because there were already divisions among them, and they obey'd neither the admiral's brother nor the captains, and all their care was upon the first fair weather, to secure a canoe and go aboard, because this could not be conveniently done with only one boat that was left them; and if the admiral would not receive them, they would endeavour to save their lives aboard that ship which was left them, and rather trust fortune than be at the mercy of the *Indians*, who would inhumanly butcher them. With this answer *Peter de Ledesma* returned to the boat which waited for him, and thence to the ships, where he gave the admiral an account how matters stood.

# CHAP. C.

*How the admiral brought off the men he had left at Belem, and struck over to Jamaica.*

The new  
colony at  
bandon'd.

THE admiral understanding the rout, the confusion and despair those ashore were in, he resolv'd to stay and bring them off, tho' not without great danger, because his ships lay in an open road, out of all shelter, and without hopes of escaping had the weather grown more boisterous. But it pleas'd God in eight days he continued there, the weather mended so much, that those ashore with their boat and large canoes fast bound together, that they might not over-set, began to gather their goods, and every one striving to be none of the last, they us'd such diligence, that in two days nothing was left ashore but the hulk of the ship, which by reason of the worms was unfit for service. Thus rejoicing we were all together again, we sail'd up that coast eastward; for tho' all the pilots were of opinion that we might return to *St. Domingo* standing away to the north, yet only the admiral and his brother, know it was requisite to run a considerable way up that coast, before they struck across that gulph that is between the continent and *Hispaniola*, which our men were much displeas'd at, thinking the admiral design'd directly for *Spain*, whereas he neither had provisions, nor were his ships fit for that voyage. But he knowing best what was fit to be done,

we held on our course till we came to *Porto Bello*, where we were forced to leave the ship *Biscaina*, it was so leaky, being all worm-eaten through and through. And holding along up the coast, we pass'd by the port we call'd *Retrete*, and a country near which there were abundance of small islands, which the admiral call'd *las Barbas*, but the *Indians* and pilots, call that the territory of the *Cacique Pocoroja*: Hence we held on ten leagues to the last land we saw of the continent, call'd *Marmora*, and on Monday the first of May 1503, we stood to the northward, the wind and currents east, which made us lie as near the wind as we could. And tho' all the pilots said, we should be east of the *Caribbee* islands, yet the admiral fear'd he should not make *Hispaniola*, which proved so; for upon Wednesday the 10th of the same month of May, we were in sight of two very small and low islands, full of tortoises, as was all the sea about, infomuch that they look'd like little rocks, for which reason those islands were call'd *Tortugas* or *Tortois*. Sailing on northwards, on Friday following about evening, 30 leagues from those islands, we came to those call'd *Jardin de la Reina*, or the queen's garden, which is a great number of islands on the south-side of *Cuba*. Being here at

an anchor, ten leagues from *Cuba*, with men and trouble enoegn, because they had nothing to eat but bisket, with some little oil and vinegar, labouring day and night at the pump, because the ships were so worm-eaten they were ready to sink, a great storm arose in the night, and the ship *Bermuda* not being able to ride it out, ran foul of us, and broke our stem and its own stern, and tho' with much difficulty, because of the roughness of the sea and high wind, it pleas'd God they got loose from one another; and tho' we cast all our anchors none would hold but the sheet-anchor, whose cable when day appeared, we found held but by a thread, which if the night had lasted an hour longer, must have given way, and all that place being full of rocks, we could not miss splitting upon some of those that were a-stern us. But it pleas'd God to deliver us here, as he had done from many other dangers. And so failing hence with much toil, we came to an *Indian* town on the coast of *Cuba*, called *Mataia*, where having got some refreshment, we sail'd for *Jamaica*, for the east winds and great currents setting westward, would not permit us to stand for *Hispaniola*, especially the ships being so worm-eaten, that as has been said, we never ceas'd day

and night working at three pumps in each of them, and if any one broke, whilst it was mended, we were forced to supply the want of it with kettles. For all this, the night before *Midsummer-Eve*, the water was so high in our ship, that there was no draining of, for it came almost up to the deck; and with much labour we held out in that manner till day appearing we put into a harbour in *Jamaica* called *Puerto Bueno* or *Good Harbour*, which tho' good to take shelter against a storm, had no fresh water, nor any town near it. Having made the best shift we could, on the day after the feast of *St. John*, we set out for another harbour eastward, called *Santa Gloria* or *Holy Glory*, which is enclosed with rocks. Being got in, and no longer able to keep the ships above water, we run them ashore as far in as we could, stranding them close together board and board, and shoaring them up on both sides, fixed them so that they could not budge; and in this posture the water came up almost to the deck, upon which, and the poop and fore-castle, were sheds made for the men to lie in, to secure our selves, that the *Indians* might not hurt us, because the island was not then inhabited or subdued by *Christians*.

The admiral runs his ships aground.

Cause of our shipwreck.

#### CHAP. CI.

*How the admiral sent canoes from Jamaica to Hispaniola, to give advice that he was cast ashore there with his men.*

Being thus fortified in our ships about a bow shot from land, the *Indians*, who were a peaceable good natured people, came in their canoes to sell provisions, and such things as they had, for our commodities. Therefore, that there might not be some disorder committed among the christians, and that they might not take more in exchange than was fitting, and the others might have their due, the admiral appointed two persons to oversee the buying of such things as they brought, and to divide daily among the men what was exchanged, because there was nothing left aboard to subsist on, as well because most of the provisions were spent, as for that the rest was spoil'd and some lost when the men came away from *Belem*, where the haste and confusion hindred things being brought off as they should. That we might be supplied with sustenance, it pleas'd God to direct us to that island, which abounds in provisions, and is inhabited by *Indians*, who are willing enough to trade, and therefore they resorted from all parts to barter such commodities as they had. For this reason, and that the christians might not

The admiral's care to prevent disorders.

disperse about the island, the admiral chose to fortify himself upon the sea, and not settle a dwelling ashore; because we being naturally disobedient, no command or punishment would have kept the men from running about the country, and into the houses of the *Indians*, to take from them what they found, and thus they would have anger'd their wives and children, which would have caus'd quarrels and made them our enemies, and the taking their provisions by force, would have reduced us to great want and distress. This could not happen now, because the men were aboard, and there was no going ashore without leave, which pleas'd the *Indians*, who sold two *Huties*, which are little creatures like rabbets, for a bit of tin, and cakes of bread they call *Zabi*, for two or three red or yellow glass beads; and when they brought a quantity of any thing, they had a hawk's-bell, and sometimes we gave a *Cacique* or great man a little looking-glass or red cap, or a pair of scissors to please them. This good order kept the men plentifully supplied with provisions, and the *Indians* were well pleas'd with our company.

pany. But it being requisite to find some means to return to *Spain*, the admiral sometimes consulted with the captains and principal men about the means of getting out of that confinement, and at last returning to *Hijpaniola*; for to stay there in hopes some ships might arrive was a mere folly, and to think to build a vessel was impossible, having neither tools nor workmen fit to do any thing to the purpose, but what would take up a long time, and not produce such a vessel as was fit to sail against the winds and currents that prevail among those islands; and therefore it had been only time lost, and would rather have proved our ruin than relief. Therefore after many consultations, the admiral resolved to send to *Hijpaniola* to give an account that he was cast ashore on that island, and desired a ship might be sent him with provisions and ammunition. To this purpose he made choice of two persons that might perform it faithfully and courageously, I say courageously, because it seemed impossible to go over from one island to the other in canoes, and there was no other way for it: These being boats, as has been said above, made of one single tree hollowed, and so contrived that when they are loaded, they are not a span above water. Besides, they must be indifferently large for that passage, because little ones would be more dangerous, and the biggest by reason of their own weight were not fit for a long voyage, or to perform what was design'd. Two canoes fit for the purpose being chose, the admiral in July 1503, ordered *James Mendez de Segura*, his chief secretary, to go in one of them with six christians and ten Indians to row, and in the other he sent *Bartholomew Fiesco*, a Genoese gentleman, with the like number of men; that as

soon as *James Mendez* got over to *Hijpaniola*, he might continue his journey to *St. Domingo*, which was 250 leagues from the place where we were, and *Fiesco* might return to bring the news that the other was safe arrived, and we might not be left in fear lest some disaster had befallen him, which there was much cause to fear; considering, as has been said, how unfit a canoe is to live upon a rough sea, especially when there were christians in it; for if there were none but Indians the danger had not been so great, because they are so dexterous, that tho' a canoe overlets when they are half way over, they turn it up again, swimming, and get into it. But honour and necessity putting men upon bolder attempts than this, the persons above-mentioned took their way along the coast of *Jamaica* to the easternmost point of it, that the Indians call *Aoamagueue* from a Cacique of that province so called, 33 leagues from *Maima*, where we were. There being 30 leagues distance between the two islands, and nothing in the way but one little island or rock eight leagues from *Hijpaniola*, it was requisite to expect a calm, in order to cross over so great a sea in such poor vessels, which it pleased God they soon had. Every Indian having put aboard his calabash of water and *Car-rabi*, or such provisions as they use, and the Christians with swords and targets, and the necessary sustenance, they put out to sea; and the admiral's brother, who went to that point of *Jamaica* to see that the Indians of the island should no way hinder them, staid there till night coming on, he lost sight of them, and then returned easily towards the ships, in his way perceiving the people of the country to converse and be friendly with us.

## C H A P CII.

*How the brothers called Porras, with many of the men, mutiny'd against the admiral, saying, they would go to Spain.*

WHEN the canoes were gone for *Hijpaniola*, the men left aboard the ships began to fall sick, as well by reason of the hardships endur'd during the voyage, as the change of diet; for at present they had no Spanish provisions, nor wine, nor flesh, except some of those *Huties* we have spoke of, they happened to get in exchange. So that those who were sound, thinking it very hard to be so long confin'd, did not forbear to mutter among themselves in private; saying, the admiral would return into *Spain* no more, because their catholick majesties had turn'd him off, nor much less to *Hijpaniola*.

Mutiny  
against the  
admiral.

VOL. II.

*niola*, where he had been refus'd admittance at his coming from *Spain*, and that he had sent those in the canoes into *Spain* to solicit his own affairs, and not to bring ships or other succours, and that he design'd, whilst they were soliciting their catholick majesties to stay there to fulfil his banishment; for otherwise *Bartholomew Fiesco* had been come back by this time, as was given out he was to do. Besides, they knew not, whether he and *James Mendez* were drown'd by the way; which, if it had happened, they should never be reliev'd, if they did not take care for it themselves, since the admi-

7 T

ral

## The first Discovery of

ral did not seem to look to it for the reasons aforesaid, and because of the gout, which had so seiz'd all his limbs, that he could scarce stir in his bed, much less undergo the fatigue and danger of going over to *Hispaniola* in canoes. For which reasons, they ought with a good heart to fix their resolution, since they were well, before they fell sick, with the rest, that it would not be in the admiral's power to hinder them; and being once in *Hispaniola*, they would be so much the better received, by how much the danger they left him in was greater, because of the hatred and enmity born him by the commendary *Lares*, then governor of that island; and that when they went into *Spain* they might go to the bishop *D. John de Fonseca*, who would favour them, as would the treasurer *Morales*, who kept for his mistress the sister of those *Porras's*, the ring-leaders of the mutineers, and chief fomenters of the sedition, who did not doubt but they should be well received by their catholic majesties, before whom all the fault would be laid upon the admiral, as had been in the affairs of *Hispaniola* with *Roldan*; and their majesties would the rather seize him and take all he had, than be obliged to perform all that was agreed upon between them and him. These and the like arguments they us'd among themselves, and the persuasions and suggestions of the aforesaid brothers, one of whom was captain of the ship *Bermuda*, and the other controller to the squadron, prevail'd with 48 men to join in this conspiracy, taking *Porras* for their captain; and every one provided what he could against the day and hour appointed; and being all ready with their arms, on the 2d of *January* in the morning, the aforesaid captain *Francis de Porras* came upon the quarter-deck of the admiral's ship, and said to him, My lord, what is the meaning that you will not go into *Spain*, and will keep us all here perishing? The admiral hearing these unusual insolent words, and suspecting what the matter might be, very calmly answer'd, He did not see which way they could go, till those that were gone in the canoes sent a ship. That no man was more desirous to be gone than he, as well for his own private interest, as for the good of them all, for whom he was accountable; but that if he had any thing else to propose, he would again call together the captains and principal men to consult, as had been done several times before. *Porras* replied, It was no time to talk, but that he should embark quickly, or stay there by himself; and so turning his back, added in a loud voice, I am going to *Spain* with those that will follow me, at which time all his followers, who were pre-

sent began to cry out, We will go with you, We will go with you, and running about, possess'd themselves of the fore-castle, poop, and round tops, all in confusion; and crying, Let them die; others, For *Spain*, for *Spain*; and others, What shall we do captain? Though the admiral was then in bed so lame of the gout that he could not stand; yet he could not forbear rising and stumbling out at this noise. But two or three worthy persons, his servants, laid hold of, and with labour laid him in his bed, that the mutineers might not murder him. Then they ran to his brother, who was courageously come out with a half pike in his hand; and wresting it out of his hands, put him in to his brother, desiring captain *Porras* to go about his business, and not do some mischief they might all suffer for, that he might be satisfied they did not oppose his going; but if he should kill the admiral, he could not expect but to be severely punish'd, without hopes of any benefit. The tumult being somewhat appeas'd, the conspirators took ten canoes, that were by the ship's side, and which the admiral had bought all about the island, and went aboard them as joyfully as if they had been in some port of *Spain*. Upon this, many more, who had no hand in the plot, in despair to see themselves as they thought forsaken, taking what they could along with them, went aboard the canoes with them, to the great sorrow and affliction of those few faithful servants, who remain'd with the admiral, and of all the sick, who thought themselves lost for ever, and without hopes of ever getting off. And it is certain, that had the people been well, not 20 men had remain'd with the admiral, who went out to comfort his men with the best words the posture of his affairs would suggest; and the mutineers, with their captain, *Francis de Porras*, in their canoes, went away for the east-point of the island, whence *James Mendez* and *Fiesco* went over <sup>Mutineers</sup> <sup>go away in</sup> <sup>the Coast</sup> <sup>of the</sup> <sup>Island</sup> for *Hispaniola*; and wheresoever they came, they insulted the *Indians*, taking away their provisions, and what else they pleas'd by force; and telling them, they might go to the admiral and he would pay them, but in case he did not, they might kill him, which was the best thing they could do; because he was not only hated by the *Cibrianians*, but had been the cause of all the mischief had befallen the *Indians* of the other island, and would do the same by them, if they did not prevent it by his death, for that was his design in staying there. Thus travelling to the easternmost point of *Jamaica*, the first calm they set out for *Hispaniola*, carrying some *Indians* in every canoe to row. But the weather not being well settled,

Their Bar- barities.

settled, and their canoes overloaded, they resolv'd to return to *Jamaica* before they were four leagues at sea, the wind turning against them, and they being able to make but little way. Besides, they not being skilful at managing the canoes, it happen'd a little water flash'd in over the sides; to remedy which, they lightened, throwing all they carried over-board; so that nothing remain'd but their arms, and as much provision as would serve them back. The wind still freshing, and they thinking themselves in some danger, it was resolv'd to murder the *Indians*, and throw them into the sea; this they accordingly executed upon some of them; and others, who for fear of death, trusting in their skill in swimming, leap'd over into the water, and being very weary would hang by the canoes to breath a little, had their hands cut off, and were wounded in other parts; so that they butcher'd 18, leaving only a few alive to steer the canoes, because they knew not how to do it. And had not the need they had of them prevented it, they had compleated the greatest act of cruelty imaginable, leaving not one of them alive, after they had by intreaties, and deceitfully drawn them to their assistance in that dan-

gerous voyage. Being come to shore, they differ'd in opinions; for some said it was better to go to *Cuba*, and that from that place where they were, they might take the east winds and currents upon their quarter, and so run over without any trouble in a short time, and so cross over from thence to *Hispaniola*, not knowing they were 17 leagues asunder: Others said it was better to return to the ships, and make their peace with the admiral, or take from him by force what commodities and arms he had left; others were for staying till another calm, to attempt the same passage again. This being thought the best advice, they staid in that town of *Acamaquique* above a month, waiting for fair weather, and destroying the country. When the fair weather came, they embark'd again twice, but made nothing of it, the wind being contrary. Being thus disappointed of that passage, they set out towards the west from one town to another, with an ill-will, without canoes or any comfort, sometimes eating what they found, and taking it where they could by force, according to their strength, and that of the *Caciques*, through whose territories they pass'd.

### CHAP. CIII.

*What the admiral did, after the mutineers were gone from him, and the Advantage he made of an eclipse.*

TO return to what the admiral did, after the rebels were gone, he took great care that the sick should be furnished with such things as were proper for their recovery, and that the *Indians* should be so civilly treated that they might not forbear bringing provisions to exchange for our commodities; which things were so well manag'd, and with such application by him, that the *Christians* soon recover'd, and the *Indians* continued some days providing all things plentifully. But they being a people that take little pains in sowing; and we eating more in one day than they did in 20; besides having no longer any inclination to our commodities, and making little account of them, they began in some measure to take the advice of the mutineers, since they saw so great a part of our men against us, and therefore brought not such plenty of provisions as we stood in need of. This brought us to great distress; for if we would have taken it by force, the greatest part of us must have gone ashore in warlike manner, and have left the admiral aboard in great danger, he being very ill of the

The *Indians* fail to supply the *Spaniards*.

gout; and if we expected they should bring it of their own accord, we must live in misery, and give ten times as much for it as we did at first, they knowing how to make their bargains, as being sensible of the advantage they had over us. But God, who never forsakes those that have recourse to him, as the admiral had, put him in the way how he should be furnish'd with all he wanted, which was thus. He bethought himself, that within three days there would be an eclipse of the moon in the first part of the night; and then sends an *Indian* of *Hispaniola*, who was with us, to call the principal *Indians* of that province, saying, he would talk with them about a matter of concern. Being come that day before the eclipse was, he ordered the interpreter to tell them, That we were *Christians*, and believ'd in God, who dwelt in heaven, and took care of the good, and punish'd the wicked: That he seeing the rebellion of the *Spaniards*, had not permitted them to go over to *Hispaniola*, as *James Mendez* and *Fiesco* had done, but had made them run through all those sufferings and dangers all

the

the island had heard of: That as for the *Indians*, seeing how negligent they were in bringing provisions for our commodities, he was angry with them, and had decreed to punish them with plague and famine; which because perhaps they would not believe, God had appointed to give them a manifest token of it in the heaven that they might plainly know the punishment was to come from him. Therefore, he bid them that night, observe when the moon appear'd, and they should see her rise angry and of a bloody hue, to denote the mischief God intended should fall on them. Having said this to them, the *Indians* went away, some afraid, and others looking upon it as an idle story: but the eclipse beginning as the moon was rising, and increasing, the higher she was, the *Indians* took notice of it, and were so frightened, that they came running from all parts loaded with provisions, crying and lamenting, and pray'd the admiral by all means to intercede with God for them, that he might not make them feel the effects of his wrath, and promising for the future carefully to bring him all he wanted. The admiral said he would speak with God, and

shut himself up whilst the eclipse lasted, they still crying out to him to assist them; and when the admiral saw, the eclipse began to go off, and the moon would soon shine, he came out of his cabin, saying, He had pray'd to his God for them, and promis'd him in their names they would be good for the future, and use the *Christians* well, bringing them provisions and other necessities; and that therefore God forgave them, and as a token of it they should see the angry and bloody colour of the moon would go off. This proving so; just as he spoke it, they gave the admiral many thanks, and prais'd God, continuing so till the eclipse was quite pass'd. From that time forwards they always took care to provide all that was necessary, ever praising the God of the *Christians*; for they believ'd the eclipses they had seen at other times, had denoted mischiefs to befall them; and being ignorant of the cause of them, and that they happened at certain times, not believing it possible to know on earth, what was to happen in the heavens, they certainly concluded the God of the *Christians* had reveal'd it to the admiral.

## C H A P. CIV.

*Of another mutiny among those that remain'd with the admiral, which was quell'd by the coming of a vessel from Hispaniola.*

Another  
Mutiny.

EIGHT months being pass'd after *James Mendez* and *Baribolomew Pisco* went away, and there being no news of them, the admiral's men were very much cast down, suspecting the worst; some saying they were lost at sea; others, that they were kill'd by the *Indians* in *Hispaniola*; and others, that they had died with sickness and hardships; for from the point of that island, which lay next *Jamaica*, there was above 100 leagues to *S. Domingo*, whither they were to go for relief, the way by land being over uncouth mountains, and by sea against the prevailing winds and currents. To confirm their suspicion, some *Indians* assur'd them they had seen a canoe overfet and carried on the coast of *Jamaica* by the current, which its likely had been spread abroad by the mutineers to make those that were with the admiral despair of getting off. They therefore concluding for certain that no relief would come to them; one *Bernard*, an apothecary of *Valencia*, with two companions, whose names were *Zanora* and *Villatoro*, and most of those that had remain'd sick, secretly conspir'd together to do the same the others had done before. But almighty God, who knew how dangerous this second

sedition must be to the admiral, was pleas'd to put a stop to it by the coming of a vessel sent by the governor of *Hispaniola*. It came to an anchor one evening near the ships that were a ground; and the captain of it, whose name was *James de Escobar*, came in his boat to visit the admiral, saying, The commendary and governor of *Hispaniola* sent him his commendations; and not being able so soon to send a ship fit to carry off all those men, had sent him in his name to visit him, and presenting him a cask of wine and two fitches of bacon, return'd to his caraval, and without taking any letter, sail'd away that very evening. The men, somewhat comforted with his coming, took no notice of what they had conspir'd to do; tho' at the same time they much wonder'd that the caraval had stole away so privately, and in such haste; and they suspected, that perhaps the governor of *Hispaniola* would not have the admiral go thither. He being aware of it, told them he had so ordered it, because he would not go away without carrying them all off, which that caraval was not big enough to perform; he being willing to prevent any disorders his stay might occasion, from the mutineers. But the

grace for  
itself.

the governor of *Hispaniola* was afraid that if the admiral return'd to *Spain*, their catholic majesties would restore him to his government, and so he should be forced to quit it; for which reason he would not provide, as he might have done, for the admiral's voyage to *Hispaniola*; and therefore had sent that

little caraval to spy and observe the condition the admiral was in; and to know whether he could contrive with safety to have him destroyed, which he knew, by what had happened to *James Mendez*, who sent an account of his voyage in writing, by the caraval, which was as follows.

## C H A P. CV.

*An account of what happened to James Mendez, and Fiesco in their voyage.*

**J**AMES Mendez, and Fiesco, setting out from *Jamaica*, that day they found the weather settled calm, and so held on till night, encouraging and persuading the *Indians* to row with those paddles they use instead of oars; and the weather being violently hot, they would sometimes leap into the water and swim, and then come fresh again to row. Thus holding on their way, at sun-set they lost sight of land, and half the *Christians* and *Indians* taking their watch together at night to row, and take care the *Indians* should not prove treacherous, they advanced all that night without staying, so that when day appeared they were all weary enough. But the commanders encouraging their men, and sometimes vowing to give a good example; after eating to recover their strength, and the fatigue of the night, they fell to their labour again, seeing nothing but sky and water. And tho' this was enough to afflict them sufficiently, yet we may say of them that they were in *Tantalus* his condition; who having water within a span of his mouth, could not quench his thirst; so they were in distress; for through the ill management of the *Indians*, and the great heat of the foregoing day and night; all the water was drank up, without any regard to the future: And all heat and labour being intolerable without drink, the higher the sun ascended the second day after they set out, the more the heat and thirst increased, so that by noon they had no strength left. And as upon such occasions, the head is bound to supply the defect of the hands and feet; so by good fortune, the captains found two casks of water, wherewith now and then relieving the *Indians*, they kept them up till the cool of the evening, encouraging them, and affirming they should be soon near a small island called *Nabazza*, which lay in their way eight leagues distant from *Hispaniola*. This with their extraordinary thirst, and the labour of rowing two days and a night, quite cast them down, believing they had lost their way; for according to their reckoning they had run 20 leagues, and ought now to be in sight of the island. But it was weariness that deceived them, as well because a canoe that rows well cannot in a day and night row above

10 leagues, as by reason the currents are against them that go from *Jamaica* to *Hispaniola*, which they always judge to be more that suffer most by it. Night being come, having thrown one into the sea who died with thirst, and others lying stretch'd out on the bottom of the canoe, they were so afflicted in mind, and so weak and spent, that they hardly made any way. Yet, taking sometimes sea-water to refresh their mouths, which we may say was the comfort given our saviour, when he said, *I thirst*; they gently held on their way till the second night came on without sight of land: But they being of those God intended to save, it pleas'd him, that in that time of need, when the moon began to rise, *James Mendez* perceiv'd she got up over-land, for a little island cover'd her in the nature of an eclipse. Nor could they have seen it otherwise, because it was small, and at that time of night. Comforting them cheerfully, and showing them the land, he so encouraged them, supplying them in their great thirst with a little water out of the barrels, that the next morning they found themselves near the small island, we said was 8 leagues from *Hispaniola*, and called *Nabazza*. They found it to be all round a hard rock, and about half a league in circumference. Landing there the best they could, they all gave God thanks for that mercy; and there being no spring nor tree, they went about taking up rain-water with their calabashes, which lay in holes among the rocks; which it pleas'd God to give them such plenty of, that they fill'd their bellies and vessels; and tho' the wiser sort advis'd the others to use moderation in drinking, yet thirst made some of the *Indians* exceed all measure, whereof some died there, and others got desperate distempers. Having rested that day till evening, diverting themselves, and eating such things as they found along the shore; for *James Mendez* had all utensils to strike fire, rejoicing to be in sight of *Hispaniola*; and fearing some bad weather might start up, they made ready to put an end to their voyage, and accordingly about sun-setting in the cool of the evening, they set out towardscape *St. Michael*, the nearest land of *Hispaniola*, where they arriv'd the next morning

Great Distress for thirst.

Bale Practice of the Governor of Hispaniola.

morning, being the fourth day after they set out. When they had rested here two days, *Baribolomeo Fiesco*, who was a gentleman that stood upon his honour, would have return'd as the admiral had commanded him, but the men who were sailors, and *Indians*; being spent and in dispos'd with their past labour, and drinking sea-water, and thought they had been delivered out of the whales belly, their 3 days and nights answering to those *Jonas* lay there, he could not get a man to go with him. *James Mendez*, as being most in haste, was gone up the coast of *Hispaniola* in his canoe, notwithstanding he suffer'd under a quartan ague caus'd by his great sufferings at sea and at land, in that condi-

tion, travelling over mountains and bad roads, he came to *Xaragua*, which is a province in the west of *Hispaniola*, where the governor then was, who seem'd to rejoice at his coming, tho' afterwards he was tedious in dispatching him, for the causes above-mention'd, till after much importunity, it was obtain'd of him, that he should give *James Mendez* leave to go to *St. Domingo*, there to buy and fit out a vessel with the admiral's money; which ship being by him got ready, was sent to *Jamaica* at the latter end of *May* 1504, and failed for *Spain*, according to the admiral's direction, to give their catholic majesties an account of the success of his voyage.

## C H A P. CVI.

*How the mutineers set themselves against the admiral, and would bear of no agreement.*

*The admiral finds and offers pardon to the mutineers.*

NOW to return to the admiral, who with all his company had now receiv'd some comfort and certain hopes of being delivered, by the account of *James Mendez* his arrival, and the coming of the caraval; he therefore thought fit to make it known to the mutineers, that their jealousy ceasing, they might return to their duty. He therefore sent two men of note, who had friends among them, and knowing they would not believe, or at least not seem to believe the coming of the caraval, he sent them part of the bacon, the captain of it had presented him. These two being come where captain *Porras* was, with those he confided most in, he came out to meet them, that they might not move, or persuade the men to repent them of the crime they had committed, imagining, as the truth was, that the admiral sent them a general pardon. Yet it was not in the power of the brothers so to curb their men, but that they heard the news of the coming of the caraval, the health of those that were with the admiral, and the offers he made them. After several consultations among themselves, and the principal men, the result was, that they would not trust to the pardon the admiral sent them, but would go peaceably away to *Hispaniola*, if he would promise to give them a ship to go in, provided two came; and if there came but one, he should assign them half of it; and in the mean while, because they had lost their clothes, and commodities they had to trade upon the sea, he should share what he

had with them. To which the messengers answering, that those were no reasonable proposals, they interrupted them saying, that since it was not granted them by fair means, they would have it by force. Thus they dismiss'd the admiral's messengers, misinterpreting his offers, and telling their followers, that he was a cruel revengeful man; and tho' they fear'd nothing for themselves, because the admiral durst not presume to wrong them, because of the favour they had at court, yet they had reason to fear he would be reveng'd on the rest, under colour of just punishment; and that for this reason, *Roldan* and his friends in *Hispaniola* had not trusted him, nor his offers, and it succeeded well with them, they finding so much favour, that they had him sent into *Spain* in irons. And that the coming of the caraval with the news of *James Mendez*, might make no impression on them, they intimated to them, that it was no true caraval, but a phantom made by art magick, the admiral being very skilful in that art, alledging, it was not at all likely, that if it had really been a caraval, the men aboard it would not have had some further discourse with those about the admiral, but would have vanish'd so soon. Nay, it was more probable, that had it been a caraval, the admiral himself would have gone aboard it, with his son and brother. With these and other words to this purpose, they again confirm'd them in their rebellion; and then brought them to resolve to repair to the ships to take what they found by force, and secure the admiral.

*The rebels obstinate.*

*The rebels resist.*

## C H A P. CVII.

*How the mutineers being come to the ships, the admiral's brother went out to fight them, overcame them, and took Porras their captain.*

THE mutineers continuing obstinate in their wicked resolution, came to a town of the *Indians* within a quarter of a

league of the ships, then called *Maima*, where afterwards the *Christians* built the town they called *Sevil*; which the admiral under-

understanding, and being inform'd of their  
design, he resolv'd to send his brother a-  
gainst them, to endeavour to reduce them by  
good words; but so attended, that if they of-  
fer'd him any wrong, he might be able to  
oppose them. To this purpose, the lieuten-  
ant drew out 50 men, well arm'd, and rea-  
dy for any service. These being come to a  
small hill, a bow-shot from the town where  
the rebels were, sent those two before, who  
had gone on the first message, to require  
them to be peaceable, and that their captain  
should come peaceably to a conference. But  
they being nothing inferior in strength or  
number, and almost all seamen, persuaded  
themselves, that those who came with the  
lieutenant were weak men, and would not  
fight them; therefore they would not per-  
mit the messengers to talk to them, but with  
their naked swords, and the spears, they had  
all in a body, crying, Kill, kill, fell upon  
the lieutenant's party; six of the rebels, who  
were accounted the boldest, having taken an  
oath, not to part, but go directly against the  
lieutenant, for if he were kill'd, they made  
no account of the rest; wherein it pleas'd  
God they were disappointed; for they were  
so well received, that 5 or 6 of them drop'd  
at the first charge, most of them being of  
those that aim'd at the lieutenant, who fell  
upon his enemies in such manner, that in a  
very short time, John Sanchez de Cadiz, from  
whom Quibio made his escape, was kill'd, as  
was John Barba; the first I saw draw his  
sword when they ran into rebellion, and some  
others fell very much wounded, and Francis  
de Porras their captain was taken. Seeing  
themselves so roughly handled like base re-  
bellious people, they turn'd their backs and  
fled as fast as they could. The lieutenant  
would have pursued, had not some of the  
chief men about him been against it, saying,  
it was good to punish, but not so severely,  
lest when he had killed many of them, the  
Indians should think fit to fall upon the  
victors, since he saw they were all in arms,  
waiting the event of the fray, without taking  
either side. The lieutenant approving of  
the advice, return'd to the ships, carrying  
along with him the captain of the rebels  
and some other prisoners, where he was well  
receiv'd by the admiral, his brother, and  
those that had remain'd with him, all of them  
giving thanks to God for that victory, which  
they attributed to him, and wherein the guil-  
ty had receiv'd their just punishment, and  
their pride been humbled, none being wound-  
ed on our side but the lieutenant in his hand,

and one of the admiral's gentlemen of the  
chamber, who died of a small wound he re-  
ceiv'd with a spear in his hip. But to return  
to the rebels, Peter de Ledezma, that pilot  
we mention'd above, who went with Vincent  
Yanez to Honduras, and swam ashore at Be-  
lem, fell down certain rocks, and lay hid  
that day and the next, till the evening, no  
body assisting him, or knowing where he  
was, except the Indians, who with amaze-  
ment, not knowing how our swords would  
cut, with little sticks opened his wounds,  
one of which was in his head, and his brains  
were seen thro' it, another on his shoulder,  
so large that his arm hung, as it were, loose,  
and the calf of one leg almost cut off, so  
that it hung down to his ankle, and one foot,  
as if it had a slipper on it, being sliced from  
the heel to the toes. Notwithstanding all  
which desperate hurts, when the Indians dis-  
turb'd him, he would say, Let me alone,  
for if I get up, &c. And they at these words  
would fly in a great consternation. This  
being known aboard the ships, he was car-  
ried into a thatch'd house hard by, where  
the dampness and gnats were enough to have  
kill'd him. Here instead of turpentine, they  
dress'd his wounds with oil, and he had so  
many, besides those already mention'd, that  
the surgeon who dress'd him swore, that for  
the first 8 days, he still found out new ones,  
and yet at last he recover'd, the gentleman  
of the chamber dying, in whom he appreh-  
ended no danger. The next day, being  
the 20th of May, all those that had escap'd,  
sent a petition to the admiral, humbly beg-  
ging he would be merciful to them, for they  
repented them of what was past, and were  
ready to submit themselves to him. The  
admiral granted their request, and pass'd a  
general pardon, upon condition the captain  
should continue a prisoner, as he was, that  
he might not raise another mutiny. And  
because they could not be so easy, and conve-  
niently aboard the ships, and there might  
arise some provoking words among the com-  
mon sort, which would cause disturbance,  
and rub up old sores, which might be the  
cause of fresh tumults, and because it would  
be a hard matter to quarter, and maintain so  
many men conveniently, those few there  
were beginning to suffer want, he resolv'd to  
send them a commander with commodities  
to exchange, that he might go with them  
about the island, and contain them within  
the bounds of justice, till such time as the  
ships came, which he daily expected.

A wonder-  
ful account  
of a wound  
done.

The rebels

# CHAP. CVIII.

How the admiral went over to Hispaniola, and thence into Spain, where at Valladolid  
it pleas'd God to take him to himself.

THE christians being all again return'd  
to their duty, and the Indians for

that same reason being more careful to sup-  
ply them for their commodities, some days  
pass'd

pass'd which made up a year since we arrived at *Jamaica*. After which, there arrived a ship, which *James Mendez* had bought and fitted out at *St. Domingo* with the admiral's money, aboard which all the men, as well enemies as friends, were shipped, and setting sail on the 28th of *June*, we proceeded on our voyage with much difficulty, the winds and currents, as we have said before, being very contrary to go from *Jamaica* to *St. Domingo*, where we arrived in great need of rest, on the 13th of *August* 1504; and the governor made a great reception for the admiral, lodging him in his own house; tho' this was a treacherous kindness; for on the other side, he set *Porras* who had headed the mutineers at liberty, and attempted to punish those who had a hand in apprehending of him, and to try other causes and offences that belong'd only to their catholick majesties, who had appointed the admiral captain general of their fleet; and yet he fawned upon the admiral, using all demonstrations of kindness in his presence. This lasted till our ship was refitted, and another hired, on which the admiral, his kindred and servants embark'd, most of the rest remaining in *Hispaniola*. We sailed on the 2d of *September*, and being but two leagues at sea, the mast of the ship came by the board; for which reason the admiral caused it to return into the harbour, and we in the other held on our course for *Spain*. Having run about the 3d part of the way, there arose such a terrible storm, that the ship was in great danger. The next day, which was the 19th of *October*, the weather being fair, and we very still, the mast flew into four pieces; but the courage of the lieutenant, and the admiral's ingenuity, tho' he could not rise out of his bed for the gout, found a remedy for this misfortune, making a jury-mast of a yard, and strengthening the middle of it with ropes, and some planks they took from the poop and stern. In another storm we spent our foremast, and yet it pleased God we sailed 700 leagues in that condition, and arrived at the port of *St. Lucar de Barrameda*, and thence to *Sevil*, where the admiral took some rest after the fatigues he had gone through; and in *May* 1505, set out for the catholick king's court; for the glorious queen *Isabel* had the year before exchanged this life for a better, which was no small trouble to the admiral, she having always favoured and supported him, whereas the catholick king had proved unkind and adverse to his affairs, which plainly appeared by the reception he gave him; for tho' to appearance he shew'd him a favourable aspect, and pretended to restore him to his full power, yet he would have quite stript him of

all, had not shame hindered him; which, as has been said, has great power over noble spirits; and the king himself and queen had both ingag'd their faith to him, when he went upon his last voyage. But the *Indies* daily more and more discovering what they were like to be, and the king perceiving how great a share fell to the admiral, by virtue of the articles granted him, he strove to have the absolute dominion in himself, and to dispose of all those employments which belong'd to the admiral, according to his own will and pleasure. Hereupon he began to propose new terms to him, by way of equivalent, which God would not permit to take effect; because just then king *Philip* I. came to reign in *Spain*; and at the time his catholick majesty went from *Valladolid* to meet him, the admiral much oppress'd with the gout, and troubled to see himself put by his right, other distempers coming on him, gave up his soul to God upon *Ascension-Day*, being the 20th of *May* 1506, at the aforesaid city of *Valladolid*, having devoutly received all the sacraments of the church, and said these words last, *Into thy hands, O Lord, I commend my spirit*; which through his infinite mercy we do not question but he received into his glory: To which may he admit us with him.

His body was afterwards convey'd to *Sevil*, and there by the catholick king's order magnificently buried in the cathedral, and an epitaph in *Spanish* cut on his tomb, in memory of his renewed actions, and discovery of the *Indies*. The words are these:

A CASTILIA, YA LEON,  
NUEVO MUNDO DIO COLON.

That is,

Columbus gave Castile and Leon a new world.

words well worth observing, because the like cannot be found either among the ancients or moderns.

It will therefore be ever remembred, that he was the discoverer of the *West-Indies*, tho' since then, *Ferdinand Cortez* and *Francis Pizarro* have found out many other provinces and vast kingdoms on the continent; for *Cortez* discovered the province of *Yucatan*, and the city of *Mexico*, called *New Spain*, then possess'd by the great *Montezuma*, emperor of those parts; and *Francis Pizarro* found out the kingdom of *Peru*, which is of a vast extent, and full of endless wealth, which was under the dominion of the great king *Atabaliba*. From which countries and kingdoms there come every year into *Spain*, many ships laden with gold, silver, brazil, cochineal, sugar, and many other commodities of great value, besides pearls and other jewels, which are the cause that at this time *Spain* and its princes flourish and abound in wealth.

*This*

*This LETTER underneath was written by Mr. Greaves to the famous Claudius Hardy, who published EUCLID's DATA, and was in great Esteem for his Learning in the Mathematicks, and his skill in the Oriental Languages.*

*Clarissimo Doctissimoque Viro D. C. H. To the most worthy and most learned D. C. D.*

**Q**Uatuor anni elapsi sunt (vir clarissimè) ex quo propter longinquam peregrinationem à me in Orientem susceptam, nulla mihi opportunitas data est, affectum, sincerumque tibi animum testandi. Tandem favente NUMINE, salvo & incolumi reverso, conceditur nonnihil otii, & de periculis præteritis, & de amicis veteribus, cogitandi. Inter quos si rectè de humanitate, studiisque tuis judico, nemo erit qui de reditu meo, majori, quàm tu, lætitiâ afficiatur. Eaque tantò erit accumulatio, cùm intellexeris iter tam periculosum non alias ob causas initum, nisi ut linguis orientalibus, & studiis astronomicis, peregrè felicius incumberem, in quibus utriusque quantum profeceris, eruditis tuis scriptis, literatis omnibus satis comprobasti. Quapropter breviter, strictimque, ubi commemoratus sim, quid præstiterim, & quos libros mecum adduxerim, pro veteri amicitia tibi indicabo. Primum annum Constantinopoli egi, ut me totum linguæ Arabicæ addicerem, sed spe falsus, idoneis destitutus magistris, ad alias curas animum induxi, cùmque diligenti librorum MSS. disquisitioni applicui. Quo quidem in genere non poenitendam operam locavi. Nam præter varios codices Arabicos, Persicos, Turcicos, propemodum de universis scientiis scriptos, & præter lexica melioris notæ tribus hæc linguis deservientia, coemi insuper penè omnes antiquos mathematicos Græcos, in idioma Arabicum ante aliquot sæcula traductos, unà cum operibus præcipuè astronomorum recentium, apud Arabes, & Indos, maxime insignium. Inter verò illos antiquos, non leviter gaudeo adhuc superstites reperiri, quatuor libros Apollonii Pergæi geometræ subtilissimi.

في قطع الخطوط على النسي

quorum Pappus, alique meminerunt. Constantinopoli cum classe Turcicâ solvi, eo anni tempore, quo solent, multis navigiis simul, pro more gentis, Alexandriam petere. Fretus satis prosperâ navigatione Rhodum appuli, ubi, propter auctoritatem Possidonii, clanculum in submænicianis Christianorum hortis altitudinem solis sæpe ob-

**I**T is now four years, worib; sir, since my long travels into the East have deprived me of the opportunity of giving you some testimony of my affection, and sincere inclinations to you. Being at length, by the help of God, returned in safety, I have some leisure to think on past dangers, and old friends, among whom, if I be not mistaken in your favour and inclinations, none will more rejoice at my return than you. And your satisfaction will be the greater, when you understand that I undertook so dangerous a journey upon no other account, but to apply my self more successfully in foreign parts, to the study of astronomy, and the oriental languages, in both which, how great a proficient you are, has been sufficiently made appear to the learned world by your writings, full of erudition. I will therefore, in pursuance of our former friendship, briefly inform you in what parts I resided, what I did there, and what books I have brought with me. I spent the first year at Constantinople, with a design to apply my self wholly to the Arabick tongue, but being deceived in my expectation, and wanting able masters, I bent my mind to other affairs, and applied my self to a diligent search of manuscript books. Wherein I have not lost my labour: for besides several Arabick, Persian, and Turkish books, which treat of almost all sciences, and besides the best lexicons for the understanding of these three languages, I have bought almost all the ancient Greek mathematicians, translated some ages since into the Arabick tongue, together with the works of the most renowned modern astronomers among the Arabians and Indians. But among these ancient ones, I do not a little rejoice, that there are still found in being four books of Apollonius Pergæus, the most subtle geometrician,

Conicorum libri quatuor.

of which Pappus, and others make mention. I sailed from Constantinople with the Turkish fleet at the same time the great convoy of that nation uses to set out for Alexandria. My passage was good, and I arrived at Rhodes, where, in respect to Possidonius's authority, I often took the sun's altitude privately in the gardens of the Christians without the walls.

servavi: inde post sex dies è portu discedens, octo dierum spatio, flantibus leniter Etesiiis, Alexandriam perveni: ubi corruptis Judæis, qui vectigalibus ibi præfunt, instrumenta mea astronomica sine periculo exposui. Erant autem diversa, ex ære ut plurimum fabrefacta, & ab egregio artifice summâ cum diligentia constructa, quorum maximum quadrans erat totus æneus, radium obtinens septem eorum pedum, qui apud Anglos veteri edicto regio usurpatur. Alexandriæ sex menses continuos hæsi, soli stellisque intentus, quoties per caligines, aut pluvias, licebat, quas illic, mediâ præcipuè hyeme, contra receptam opinionem, & crebras, & violentas, esse sensi. Laboribus, & vigiliis defessus, relaxandi animi gratiâ bis Memphim petii, seu ut rectius loquar *مصر القديمة* Nam antiquâ Memphi orientalius est hodierna Elkahira septem ad minimum millibus passuum: inde ad sepulcra veterum Ægyptiorum accessi, & cryptas illas subterraneas subii; post ad pyramides me contuli, earumque justam magnitudinem, idoneis ad eam rem adjunctis instrumentis, deprehendi, & multa illic, dum omnia curiosius perlustro, nec à præfisis scriptoribus, nec à recentioribus, literis mandata, annotavi. Opera sanè stupenda, & ab ipsis antiquis inter orbis miracula meritis judicata, sed a nemine (quod sciam) pro eorum dignitate satis descripta.

Interiorem cameram, & nonnulla secretiora adyta, temporis injuriâ nondum corrupta, nec unquam, si rectè judico, corruptenda, mensuris Anglicis diligenter mensus sum, adeo exactè, ut è viginti mille partibus, in quas viginti pedes, lineis transversis, sive potius diagonis, divisi, ne unam quidem, vel deesse, vel superesse, existimem. Quod ideo tanto accuratius præstiti, ut ex istâ comparatione omnium gentium mensuræ, quæ hodie sunt, aut olim fuerunt, è duraturo aliquo monumento posteris signari possint. Quod quidem si à Mathematicis olim præstitum fuisset, selectis aliquibus idoneis locis, temporum injuriæ non obnoxiiis, minus hodie incerti essemus in antiquorum mensuris investigandis. Quid de meo consilio censendum sit, eruditorum judicio permitto; me certe, neque propositi, neque laboris, suscepti poenitet. Te verò (vir clarissime) inter alios præcipuè, oro, & obsecro, ut pondera, & mensuras gallicas, summâ diligentia cum archetypis, collatis, & regio sigillo, ut fieri adest, munitas ad me transmittas, & si qua numismata, vasa præfata, vel pedes vetusti, ad hæredibus nobilissimi D. viri Perescii recuperari possint, meo ære compares. Multum ille in hac palæstrâ desudavit, & quantum ex literis

*Departing that port after six days, a gentle easterly gale, in eight days, brought me to Alexandria; where bribing the Jews, who have the collecting the customs, I landed my astronomical instruments in safety. I had several of them, most of them of brass, and made by a notable workman, with extraordinary accuracy; the biggest whereof was a brass quadrant, whose radius was seven ancient statute foot of England. I continued six whole months at Alexandria, observing the sun and stars, as often as fogs and rains would permit; which, contrary to the received opinion, I found to be frequent and violent, especially in the depth of winter. Being spent with labour and watching, I went twice to divert my self to Memphis, or to speak more properly, Elkahira: for the present Elkahira (Grand Cairo) is at least seven miles to the eastward of the ancient Memphis. Thence I repaired to the sepulchres of the ancient Egyptians, and entered those subterranean cells, or caverns; thence I went to the pyramids, and having fit instruments for that purpose, took their exact dimensions, observing there many things, as I curiously view'd them, which have not been delivered in writing either by the ancient or modern authors. They are indeed amazing structures, and deservedly reckoned by the ancients among the wonders of the world, but not yet described as they ought to be by any one that I know of.*

*I carefully took the dimensions of the inner chamber, and some more private places, which time has not yet, nor, if I mistake not, ever will destroy, with English measures, and that so exactly, that I believe there is not one part over or under of 20000, into which twenty foot are divided by cross, or rather diagonal lines. Which I was the more exact in, to the end that the measures of all nations that now are, or formerly were, may be transmitted to posterity from some lasting monument, by comparing them with these. Had this been formerly done by mathematicians, choosing for the purpose some proper places not exposed to the injury of time, we should not at present be so uncertain in the search after the measures of the ancients. I leave it to the learned to determine, what judgment is to be made of this my design; for my part I neither repent my attempt nor my labour. I intreat and conjure you (most worthy sir) to send me the French weights and measures, carefully compared with the standards, and sealed by the king's authority, as is usual; and if any coins, old vessels, or ancient feet can be obtained of the heirs of the most noble Perescius, that you will buy them upon my account. He laboured much in this affair, and, as may be conjectured by his letters, had he brought forth what he had so long conceived,*

ipſius licet conſpicere, ſi peperiffet, quæ tam diu parturivit, omnium induſtriam, & conatus facilè ſuperaffet. Ipſe dum peregrè agebam tanquam itineris præſectus, Arabum, Perſarum, Turcarum, Itolorum, Hiſpanorum, Germanorum, varia, & diverſa pondera, & menſuras, meis oculis, manibusque ſubjeci, & cum Anglicis ſedulò, & fideliter contuli. Idem & de Gallicis in animum induxiſſem, ſi per Pariſios domum redire contigiſſet, ſed, ſpe fraſtratus, iſtam tibi, tuæque diligentiæ provinciam demando. Tu me interea eadem benevolentia proſequeris, quâ ſolchas, & ſi quid, quod mihi adjumento eſſe poſſit, repereris, viro doctiſſimo, meique amantiſſimo, D. Dorrel in ædibus oratoris Angli, committe. Vale.

Londini 18 Kal.  
Jun. MDCXLI.

Tibi addiſtiſſimus,

JOANNES GRAVIUS.

*conceiv'd, he would doubtleſs have out-done all others. I, during my travels, by the by, view'd and handled the ſeveral and ſundry weights and meaſures of the Arabians, Perſians, Turks, Italians, Spaniards, and Germans, and carefully compar'd them with the Engliſh. I ſhould have done the ſame by the French, had I returned home by the way of Paris, but being diſappointed of it, I commit this affair to your care. Do you continue your wonted good will to me, and if you happen to find any thing that may be a help to me, deliver it to the moſt learned gentleman, and my very good friend, Mr. Dorrel, at the Engliſh ambaffador's. Farewel.*

London, May  
14. 1641.

Your moſt affectionate,

JOHN GREAVES.

*Cheaves* *flection*, *Cchemmis*,) signifying *adulstion*, which anciently might be the same in *Aegyptian*, and *χλωψ*, or *χλωψ*, signifying *swarthy visage* or *adulst*; *Herodotus* might call him *Cheops* in Greek, whom in the *Aegyptian* language *Diodorus* styles *Cchemmis*. But I go on with *Diodorus*. This *Cchemmis*,<sup>1</sup> faith he, erected the greatest of these three *Pyramids*, which are reputed among the seven wonderful fabricks of the world; where he also enlarges the number of the workmen employed by him, to three hundred and sixty thousand, which *Herodotus* mentions only to have been an hundred thousand; though both of them concur, and <sup>2</sup> *Pliny* with them both, that twenty years were spent in the building of this *Pyramid*.

Concerning the second *Pyramid*, *Herodotus* and *Diodorus* assign the author of it to have been *Cephren*, brother to the former king. *Diodorus* adds, that by some he is also called *Chabryis*, and was the son of *Cchemmis*; a difference which I imagine to have been occasioned out of the diversity of pronunciation of *Chabryis* for *Cephren*; there being an easy transmutation in letters of the same organ, as *grammarians* use to speak. *Cheops*, as <sup>3</sup> *Herodotus* informs us, being deceased, his brother *Cephren* reigned after him; who imitated him, as in other things, so in the making of a *Pyramid*, the magnitude of which is less than that of his brother's. And <sup>4</sup> *Diodorus* relates, That *Cchemmis* being dead, his brother *Cephren* succeeded him in the kingdom, and reigned fifty six years: some say, that not his brother, but his son, which was named *Chabryis*, reigned after him. This is affirmed by the consent of all, that the successor of the former king, in imitation of him, built the second *Pyramid* like to the first, in respect of the art and workmanship, but far inferior to it in respect of magnitude.

The third *Pyramid* was erected by *Myserinus*, some call him *Myserinus*, as it is observed by *Diodorus*, who makes him the son of *Cchemmis*, as *Herodotus* doth of *Cheops*; the difference between them being, as we noted before, rather nominal than real. The same <sup>5</sup> *Herodotus* also writes, That some of the *Grecians* make the third *Pyramid*

the work of *Rhodopis* a *curtizan*; an error in opinion of those who seem not to know who this *Rhodopis* might be of which they speak; for neither could she have undertaken such a *Pyramid*, on which so many thousand talents were to be spent; neither lived she in this man's time, but in the time of king *Amasis*. Now this *Amasis*, as he elsewhere shews, lived long after these *Pyramids* were in being. The same story is cited both by <sup>6</sup> *Strabo* and *Pliny*, both of them omitting the names of the founders of the former two. *Strabo* gives her a double name; The third *Pyramid* is the sepulchre of a *curtizan*, made by her lovers, whom *Sappho* the poetess calls *Doricha*, mistress to her brother *Charaxus*; others name her *Rhodope*. But whether we name her *Doricha*, or *Rhodope*, the relation is altogether improbable, if we consider either her condition or the infinite vastness of the expence. For <sup>7</sup> *Diodorus*, though he rightly acknowledges this *Pyramid* to be much less than either of the former two, yet in respect of the exquisite workmanship, and richness of the materials, he judges it not inferior to either of them. A structure certainly too great and sumptuous to have been the design and undertaking of a *curtizan*, which could hardly have been performed by a rich and potent monarch. And yet *Diodorus* hath almost the same relation, only a little altered in the circumstances: <sup>8</sup> Some say, that this is the sepulchre of the strumpet *Rhodope*; of whom, some of the *Nomarchæ* (or prefects of the provinces) being enamoured, by a common expence to win her favour, they built this monument. But to pass by this fable, (for it is no better,) and to return to our enquiry. The same author immediately before, ingenuously confesses, that concerning them all three, there is little agreement either amongst the natives or amongst writers: <sup>9</sup> For they say, *Armæus* made the greatest of these; the second, *Amasis*; the third, *Inaron*. And <sup>10</sup> *Pliny* informing us, that these three were made in seventy eight years and four months, leaves the founders of them very uncertain: for reciting the names of many authors that had described them, he

<sup>1</sup> *Diod. Sic. lib. 1.* Χίρμις] κατισμένης ὅ τὴν μάλιστα τοῦ πρώτου Πυραμίδου τοῦ ἐν τοῖς ἑπτὰ τοῖς ἐπιφανέστατος ἦν ἐκ τῶν μόνων.

concludes, \* *Inter omnes eos non constat à quibus factæ sint, iustissimo casu oblitteratis tantæ vanitatis auctoribus.*

The *Arabians*, whose excellencies I judge to have been in the speculative sciences, and not in the histories and occurrences of ancient times, assign other founders of these three, different from those mentioned by the *Greeks*. The author of the book intitled, *Morat Alzezan*, writes, *They differ concerning him that built the Pyramids: some say Joseph, some say Nimrod, some Dalukah the queen, and some that the Egyptians built them before the flood: for they foresaw that it would be, and they carried thither their treasures, but it profited them nothing*. In another place he tells us, *That the Coptites (or Egyptians) report, that these two greater Pyramids, and the lesser, which is coloured, are sepulchres*. In the east Pyramid is king Saurid, in the west Pyramid his brother Hougib, and in the coloured Pyramid Fazarfinoun the son of Hougib: The Sabæans relate, that one of them is the sepulchre of Shitit, (that is, Seth), and the second the sepulchre of Hermes, and the coloured one the sepulchre of Sab, the son of Hermes, from whom they are called Sabæans. They go in pilgrimage thither, and sacrifice at them a cock, and a black calf, and offer up incense. Ibn Abd Albohm, another Arabian, discoursing of this argument, confesses, that he could not find amongst the learned men in Egypt, any certain relation concerning them, (wherefore) *what is more reasonable* (saith he) *than that the Pyramids were built before the flood?* For if they had been built after, there would have been some memory of them amongst men. At last he concludes, *The greatest part of chronologers affirm, that he which built the Pyramids, was Saurid Ibn Salhouk the king of Egypt, who was before the flood three hundred years*. And this opinion he confirms out of the books of the *Egyptians*: To which he adds, *The Coptites mention in their books, that upon them there is an inscription engraven; the explication of it in Arabic is this, I Saurid the king, built the Pyramids in such and such a time, and finished them in six years; he that comes after me, and says he is equal to me, let him destroy them in six hundred years; and yet it is known, that it is easier to pluck down than to build; and when I had finished them, I covered them with satin, and let him cover them with mats*. The same relation I find in several others

of them, that this *Saurid* was the founder of these three Pyramids, which the admiration of after-times enrolled amongst the miracles of the world. And these are those three, which are still fair and entire, and standing near to one another, formerly not far distant from the great and ancient city *Mempbis*, built by *Uchoreus*, of which there is now not so much as the ruins left,) and less distant from the river *Nilus*, as *Diodorus*, *Strabo*, and *Pliny*, rightly describe.

Besides these three, we find mentioned in *Herodotus* and *Diodorus*, the names and authors of some others, not much inferior to these in magnitude, long since ruined and defaced by time. On the contrary, there are many now standing in the *Libyan* desert, whose names and authors, neither *Herodotus* nor *Diodorus*, nor yet any of the ancients, have expressed.

After Myserinus, according to \*Herodotus, (for Diodorus is here silent,) *Alysbeis* succeeded in the kingdom, *a* who being desirous to excel his predecessors, left for a monument a Pyramid made of bricks, with these words engraven in stone, Compare not me with the Pyramids built of stone, which I as far excel as Jupiter doth the other gods. For striking of the bottom of the lake with long poles, and gathering the dirt which stuck to them, they made thence bricks, and formed me in this manner.

The fame author relates, that many ages after this *Ajchis*, *Sanacharib* king of the *Arabians* and *Affyrians*, who certainly is the fame which is mentioned in the fcriptions, having expelled *Sebon* the king of the *Egyptians*, and the priest of *Vulcan*,<sup>b</sup> the *Egyptians* recovering their liberty, made choice of twelve kings, (which is alfo confirmed by *Diodorus*), dividing *Egypt* into fo many parts; for they could at no time live without a king, thefe by a common confent, built a labyrinth above the lake of *Mœris*: At the angle where the labyrinth ends, there is a Pyramid of *xi*. *Orgyie*, (that is, of *ccxi* feet,) in which are engraven huge resemblances of beafts, the paffage to it is under ground. And this is that Pyramid, as may evidently be collected out of *Strabo*, in which *Imandes* lies buried, whom we may probably fuppofe to have been the builder of it: His words are thefe, At the end of this building, (that is, of this labyrinth,) which contains a furlong in length, there is a certain *ſepucbre*, being a quadrilateral Pyra- mid,

a circle of gold of three hundred and sixty five cubits compass, and a cubit in thickness, in which the days

**GREAVES** mid, each side of which is cccc feet, and the altitude is the same; the name of him that lies buried there is Imandes, whom the author of the epitome calls Maindes, and Strabo himself not long after Imandes; Diodorus names him Ojmanduas. Which of these two, whether Herodotus or Strabo, hath given the truest measure of it, unless the Pyramid were now extant, cannot be decided by us. Though Pliny adheres to the dimensions of Herodotus; but whereas Herodotus and Strabo mention there but one Pyramid, he makes mention of many. And whereas Strabo makes this to be quadrilateral, he describes these (if I mistake not his words) to be hexangular. \**Superque Nemeses xv. adiculis inclusit Pyramides complures* (that is, above this labyrinth which he places in Heracleopolite Nomo,) *quadragesimum ulnarum vi radice muros obliquescentes.*

Long before these four Pyramids of Cheops, Cephren, Mycerinus, and Asychis, who immediately succeeded one another in the kingdom, but after this of Imandes, Myris as he is called by Diodorus, (but Herodotus, Strabo and Pliny, name him Meris) another Egyptian king, built two admirable Pyramids; the description of which, tho' in Herodotus, it immediately follows that of the twelve kings; yet as it may evidently be collected out of him and Diodorus, these two of Meris must many ages have preceded. For Herodotus tells us, that from Menes (the first king of the Egyptians, whom Diodorus names Menas,) the priests recited out of their books cccxxx kings, the last of which was Meris; long after whom reigned Sesostris, who is call'd by Manethos, Setbosis; and by Diodorus, Sesostris, and Sesoosis, who more particularly than Herodotus, expresses Sesostris to have been 8 seven ages after Meris, and to have reigned long before these twelve kings. The which Sesostris, or Setbosis, immediately succeeding Amenophis, (according to Manethos in Josephus, as we shall shew in the ensuing discourse,) must have been before Cheops, Cephren, Mycerinus, and Asychis; and therefore consequently, that Meris must long have preceded these twelve kings. This Meris undertook,

and finished that most admirable lake denominated after his name, as it is testified by Herodotus, Diodorus, Strabo, and Pliny. A work the most useful and wonderful, if it be rightly considered, that I think was ever by any man attempted; in the midst of which, he erected two Pyramids, the one in memory of himself, the other of his wife, each of them being 120 feet in height; the description of both which, and of his lake, we have in Herodotus, the latter we find in Strabo, but in none so fully as in Diodorus, and therefore I shall relate his words. Ten schœnes, (that is, 120 furlongs; though Strabo and Artemidorus before him, observe a difference of schœnes in Egypt, above the city (Memphis), Myris dug a lake of admirable use, the greatness of which work is incredible. For they relate, that the circumference of it contains 120 120 120 120 furlongs, the depth of it in many places is fifty fathoms, (that is, two hundred cubits, or three hundred feet,) who therefore may not deservedly ask, that shall consider the greatness of the work, how many myriads of men, and in how many years they made it? The common benefit of it to those that inhabit Egypt, and the wisdom of the king, no man can sufficiently commend. For since the rising of Nilus is not always alike, and the country is the more fruitful by the moderateness of this, he digged a lake to receive the superfluity of the water, that neither by the greatness of the inundation unseasonably drowning the country, it should occasion marshes or lakes; or flowing less than it should do, for want of water, it should corrupt the fruits; he therefore cut a ditch from the river to the lake, eighty furlongs long, and three hundred feet in breadth. By which, sometimes receiving in, and sometimes diverting the river, he exhibited a seasonable quantity of water to the husbandmen, the mouth of it sometimes being opened, and sometimes shut, not without much art, and great expences. For he that would open the bars (or sluices,) or shut them, it was necessary that he spent at the least fifty talents. The lake in this manner benefiting the Egyptians, hath continued to our times, and from the author of it at this day, is called the lake of Myris. The king that digged it, left a place in the midst, in which he built a sepulchre and two

of the year were inscribed, and divided into a cubit a piece, with a description according to their nature, of the setting and rising of the stars, and also their operations, after the Egyptian astrologers. They lay, this circle was carried away by Cambyse and the Persians, at what time they conquered Egypt. (Diod. Sicul. lib. 1.) He which shall seriously consider this, and several other passages in Herodotus and Diodorus, of the stupendous works of the Egyptians, must needs acknowledge, that for magnificence, if not for art, they far exceeded the Grecians and Romans, even when their empires were at the height, and most flourishing. And therefore, those *admiranda Romæ*, collected by Lipsius, are scarce to be admired, if compared with some of these. At this day there is hardly any vestige or obelisk remaining in Rome, worthy of note. Which hath not anciently been brought thither out of Egypt.

Pyramids, each a furlong in height ; the one for himself, the other for his wife, placing upon them two marble-statues, sitting on a throne, imagining by these works he should propagate to posterity an immortal memory of his worth. The revenue of the fish of this lake, he gave to his wife for her unguents, and other ornaments ; the fishing being worth to her a talent a day : For they report, there are two and twenty sorts of fishes in it, and that such a multitude is taken, that those who are perpetually employed in salting them, of which there is a very great number, can hardly dispatch the work. Thus far Diodorus. Which description, as it is much more full than that of Herodotus, so Herodotus hath this memorable observation omitted by Diodorus : ' That this lake was made by hand, and hollowed, it is apparent, because almost in the midst of it, there stands two Pyramids fifty fathoms above the water, and as many fathoms of the building under-water : Upon the top of each of which, there is a Colossus of stone sitting upon a throne ; so that the Pyramids are an hundred fathoms high. Strabo I know not by what oversight omits these two Pyramids, whereas he acknowledges the lake of Meris in which they stood, to be admirable, being like a sea for greatness and for colour.

Besides these which we have handled, and whose founders are upon record in the writings of the ancients, there are many others in the Libyan desert where it bounds Egypt, of which there is no particular mention extant, either in the Greeks, Latins, or Arabians ; unless we shall apply these words of <sup>1</sup> Diodorus to some of them. There are three other Pyramids, each side of which contain two hundred feet, the structure of them, excepting the magnitude, is like to the former, (that is, as he there specifies, to those three Pyramids of Chemmis, Cephren, and Mycerinus,) these three kings before-mentioned, are reported to have erected them for their wives. The signets of some of these now extant, doth well answer the measure assigned by Diodorus : but if these three kings built them for their queens, it may be wondered why they should have placed them so remote from their own sepulchres ; or why they should stand at such large and unequal distances of several miles from one another. I find as little satisfaction in <sup>2</sup> Pliny where he writes, *Multa circa hoc vanitas ilorum hominum fuit, vestigiaque complurium inchoatarum ex-*

*tant, una est in Arsinoite Nomo, duc in GRAVES Memphi, non procul labyrintho, de quo & ipsi dicemus.* For not telling us the founders of these, he leaves us still in the same darkness, only we may in general collect out of him, and likewise out of that ode in Horace :

*Exegi monumentum ære perennius ;  
Regaliq; situ Pyramidum altius.*  
Horat. ode 30. lib. 3.

That they were the works of Egyptian kings ; but of which of them, and at what time, we are altogether uncertain. *Regum pecunia,* <sup>3</sup> saith Pliny, *otiosa, ac stulta ostentatio.* Of the same opinion is *Leo Africanus*, in his accurate description of Africa, after many years travel in those parts. *Hæc per desertum arenaceum, iuxta ad Pyramides, nempe ad præcorum Egypti regum sepulchra, quo in loco Memphi olim existisse asserunt.* It may be it was the royal prerogative, and that it was prohibited to private men, how wealthy and potent soever to be thus intombed ; but without some farther light from the ancients, it would be too great a presumption to determine any thing.

<sup>4</sup> *Lucan*, I know not upon what ground, makes as if the Ptolemies had imitated the Egyptian kings in this particular :

*Cum Ptolemæorum manes seriemque pu-  
dendam  
Pyramides claudant.*

Surely if they did, these are none of those : For they would have built them at Alexandria, which was then the regal seat, and not at Memphis, the which as <sup>5</sup> Diodorus assures us, began to decay after the building of Alexandria, like as the ancient Thebes (as the <sup>6</sup> Grecians stiled it ; or the city of the sun, as the Egyptians, according to <sup>7</sup> Diodorus, called it ; or Diospolis, as Diodorus and <sup>8</sup> Strabo also name it,) did after the building of Memphis. Those which imagine the monument or sepulchre, mentioned by <sup>9</sup> Plutarch at Alexandria, into which Cleopatra fled for fear of Augustus, to have been a Pyramid, are much deceived. For in the life of Mark Antony, where he informs us, that there were sepulchres near the temple of Isis, of exquisite workmanship, and very high ; into which she conveyed the richest of her treasures, he describes one of them, wherein she hid her self, to have

**G**RAEVES had a window above the entrance, by which she drew up with cords the body of *Antony*, and by which afterwards *Proculeius* entered, and surprized her. This window is not in any of those Pyramids I have seen; neither can I apprehend, if these were of as solid and massive stones, and of the same shape as those at *Memphis*, and the chambers within as remote from the outward superficies, of what use it could be, either in

respect of light or ornament; and therefore I conjecture these monuments of the *Ptolemies* to have been of a different structure from those of the Pyramids.

In all other classical authors, I find no mention of the founders of the rest in the *Libyan* desert; and after such a distance of time, we must be content to be silent with them.

### Of the Time in which the PYRAMIDS were built.

**T**O define the precise time in which these Pyramids were erected, as it is an inquiry of much difficulty, so of much importance, in regulating the various and uncertain traditions of the antients concerning the *Egyptian* chronology. For if we shall peruse those fragments of *Manetho*, an *Egyptian* priest, preserved by <sup>a</sup> *Josephus*; or those relations of <sup>b</sup> *Herodotus*, of cccxxx kings to *Mæris*, from *Menes* the first that reigned in *Egypt*, (who probably is <sup>c</sup> *Mizraim*, the second son of *Cham*, and <sup>d</sup> father of the *Egyptians*;) or that computation of <sup>e</sup> *Diodorus*, borrowed from their sacred commentaries, that to the clxxx *Olympiad*, or to the time in which he travelled thither, there had been a succession in the royal throne for xv cto years; or that calculation of <sup>f</sup> *Pomponius Mela*, of cccxxx kings to the time of *Amasis*, continued above xiii cto years; or lastly, those *Dynasties* mentioned by *Africanus* and *Eusebius*, but pretermitted by *Herodotus* and *Diodorus*, the first of which <sup>g</sup> *Joseph Scaliger* places in the vii cto and ix year of that *Julian* period, which by him is called *periodus Juliana postulatitia*, and the time *tempus prolepticum*, preceding the creation by cto ccc xxxvi years, we shall find our selves intangled in a labyrinth, and maze of times, out of which we cannot, without much perplexity, unwind our selves. And if we farther consider, that amongst those many names delivered by *Manetho*, and preserved by *Josephus*, *Africanus*, *Eusebius*, and *Synellus*, how few there are that concur with those of *Herodotus* and *Diodorus*, or with those in *Plato*, *Strabo*, *Pliny*, *Plutarch*, *Censorinus*, and some others: And that which is of greater consequence, how difficult is it to reconcile these names and times to the *Egyptian* kings recorded in the scriptures, we shall find our selves beset, and as it were invironed on every side with great inextricable doubts. What therefore in inquiries of this nature, is ap-

proved as the most solid and rational foundation, that is, to find out some common and received *Epocha*, in which either all or most agree, that shall be our guide in matters of so great antiquity. Now of all the ancient *epocha's* which may conduce to our purpose, that is none that we may safer rely upon than there of the migration of the *Israelites* out of *Egypt*; which had the same hand faithfully to pen it, that was the most active and miraculous instrument of their departure. And though prophane historians differ much in the manner of this action, either as they were tainted with malice against the *Hebrews*, or misled with the calumnies and false reports of their enemies, the *Egyptians*; of whom, <sup>h</sup> *Josephus* may seem to have given a true censure, *That all the Egyptians in general are ill affected to the Jews*; yet all agree in this, that *Moses* was the chief author, and conductor of this expedition. If therefore we shall discover the time in which *Moses* flourished, and in which this great enterprize was performed by him, it will follow by way of consequence, that knowing what *Pbaraoh*, or king in *Egypt*, was coetaneous and concurrent with him, we may by *synchronism*, comparing sacred and prophane authors, and following the line of their successions, as it is delivered by good authority, at length fall upon the age in which *Cheops*, and those other kings reigned in *Egypt*, whom we assigned out of *Herodotus* and *Diodorus*, to have been the founders of these Pyramids.

And here, for our inquiry, what *Egyptian* king was concurrent with *Moses*, we must have recourse to the relations, not only of the scriptures, but also of other approved authors amongst the *Jews* and *Gentiles*; in which last though we often find more than an *Egyptian* darkness, yet sometimes through this we may discover some glimmerings of light. By the scriptures alone, it is impossible to infer, what king of

Egypt

Egypt was coetaneous with Moses; seeing the name, which is there given him, of Pharaoh, is a common denomination applicable to all of them; much like Caesar or Augustus with the Roman emperors; or some time Cosroe with the Persians, and no distinctive appellation. Yet in Herodotus we find one king, the successor of Sesostris, to have been called Pheron, which I suppose is Pharaoh, and his proper and peculiar name. But who this Pharaoh should be, whose heart God hardened, and upon whom Moses wrought so many wonders, is worth our disquisition. Josephus in his first book contra Apionem, out of Manethos contends, that Teimosis (who is termed also Amosis by African. and Eusebius,) reigned then in Egypt. The whole force of his argument lies in this, that Manethos mentions the expulsion of the nation of shepherds to have been by Teimosis: but the Hebrews were a nation of shepherds: therefore the Hebrews were expelled out of Egypt, or in the scripture-pharse, departed out of Egypt under Teimosis; and consequently, that Moses, who was their conductor, was coetaneous with him. That the Hebrews were a nation of shepherds, and so accounted of themselves, and were esteemed by others, is very perspicuous. And Joseph said unto his brethren, and unto his father's house, I will go up and shew Pharaoh, and say unto him, My brethren and my father's house which were in the land of Canaan, are come unto me: and the men are shepherds, for their trade hath been to feed cattle, and they have brought their flocks, and their herds, and all that they have. And it shall come to pass, when Pharaoh shall call you, and shall say, What is your occupation? that ye shall say, thy servants trade hath been about cattle, from our youth even until now, both we and also our fathers; that ye may dwell in the land of Goshen. For every shepherd is an abomination to the Egyptians. But before we shall disprove this assertion of Josephus, which carries much speciousness with it, and therefore is approved and followed by Tatianus, by Justin Martyr, and by Clemens Alexandrinus, we shall put down the words of Manethos himself, as they are reported by Josephus in his first book contra Apionem. Timanus by name being our king, under him I know not how God was displeased, and beyond expectation, out of the eastern countries, men of obscure birth encamped themselves in the country, and easily, and without battle, took it by force, binding the princes, and besides, cruelly burning

the cities, and overthrowing the temples of the gods. Last of all, they made one of themselves a king, who was named Salatis; he reigning nineteen years, died. After him, another, named Bæon, reigned forty four years; next to him Apachnas; another, thirty six years, seven months; then Apophis, sixty one; Janias, fifty, and one month; after all, Asis, forty nine years and two months. And these were the first six kings of them always conquering, and desiring to extirpate Egypt. Their nation was called Hyclos, that is, kingly shepherds. For hyc in the sacred tongue, signifies a king; and sos a shepherd, or shepherds in the common dialect, and thence hyclos is compounded. But some say, that these were Arabians. [In other copies I have found, that by the denomination hyc, kings are not signified, but on the contrary, captive shepherds. For hyc in the Egyptian language, when it is pronounced with a broad sound, plainly signifies captives; and this seems more probable to me, and better agreeing to the ancient history.] These kings therefore, which we before mentioned, and those which were called Pastores, and those which defended of them, ruled Egypt five hundred and eleven years. After this, he mentions that by the kings of Thebes, and of the rest of Egypt, there was an invasion made against these shepherds, and a very great and lasting war. The which, he says, were conquered by a king, whose name was Alisfragmuthosis, whereby they lost all Egypt, being shut up into a place containing in circuit ten thousand acres. This space Manethos says, the shepherds encompassed with a great and strong wall, that they might secure all their substance and their spoils in a defensible place. But Themosis, the son of Alisfragmuthosis endeavouring to take them with four hundred thousand armed men, beleaguering the walls, who despairing to take them by siege, made conditions with them that they should leave Egypt, and go without any damage whither they would: they upon this agreement, no less than two hundred and forty thousand, with all their substance, went out of Egypt by the desert into Syria, and fearing the power of the Assyrians, (who then ruled Asia,) in that country, which is now called Judæa, they built a city capable to receive so many myriads of men, naming it Hierusalem.

By way of answer to Josephus, we say, that though the Israelites might properly be called shepherds, yet it cannot hence be inferred out of Manethos, that these shepherds were Israelites. Nay, if we compare this relation of Manethos, with that in Exodus, which Josephus being a Jew,

[These are the words of Josephus, and not of Manethos.]

<sup>1</sup> Σωσιππος ὁ ἐπὶ τῶν ἱερῶν ἐκείνων ἱστορεῖ τὸν βασιλεὺς τῶν ποιμένων αὐτῶν Σάλατις. Herodot. l. 2.

<sup>8</sup> Exod. i.

**G**RAVES cannot but approve of, we shall find the contrary. For there they live under a heavy slavery and persecution, whereas here they are the persecutors and afflictors; there they groan under their task-masters the Egyptians, here they make all Egypt to groan under them: Lastly, whereas there they are employed in the lowest offices, in mortar and in brick, and in all manner of service in the field: Here, after the destruction of many cities, and men, and infinite outrages committed upon the Egyptians, they make one of themselves a king, and for six descents keep themselves in possession of the royal throne, of which, after a long and bloody war, they are deprived. Their building likewise of a city in Judæa, and naming it Jerusalem, according to Manethos, is a strong argument against Josephus, that these shepherds could not have been the Israelites. For before the entrance of the Israelites into Canaan, we find that Jerusalem was a fort of the Jebusites upon mount Sion, unconquered by Joshua. As for the Jebusites the inhabitants of Jerusalem, the children of Israel could not drive them out. But they were long after subdued by David. And David and all Israel went to Jerusalem, which is Jebus, where the Jebusites were the inhabitants of the land. And the inhabitants of Jebus said to David, Thou shalt not come hither; nevertheless, David took the castle of Zion, which is the city of David. Besides all this, the history and chronology of those ancient times, if we compare sacred and prophane authors, will in no sort admit that these shepherds must have been the Israelites. For if these that departed out of Egypt in the reign of Tetbmosis, king of Thebais, or of the upper part of Egypt, were the children of Israel, then must Moses their conductor have been as ancient as Tetbmosis, or Amosis, that is, as ancient as Inachus, the first king of the Argives. For Apion, in his fourth book of the histories of Egypt, shews out of Ptolemæus Mendesium, an Egyptian priest, that this Amosis lived in the time of Inachus, as it is recorded by Tatianus, Justin Martyr, Clemens Alexandrinus, and others. Eusebius, tho' he doth not approve of it, for he places Moses in the time of Cecrops, yet he assures us, that it was a received opinion among many learned men, Moïsen Inachi fuisse temporibus eruditissimi viri tradiderunt ex nostris Clemens, & Africanus; ex Judæis, Josephus, & Justus, veteris historiæ monumenta replicantes. Now Inachus according to Cassor

an ancient chronographer, with whom Eusebius also concurs, began to reign a thousand and eighty years before the first olympiad, that is, 1100 years before the destruction of the temple under Zedekiah, and before Christ's nativity, after the Dionysian or common account, 1100 years. That of the olympiads is so assured an epocha, and so strongly and clearly proved by eclipses of the sun and moon, which are the best demonstrations in chronology, these being expressed by some of the ancients to have happen'd in such a year of such an olympiad, as by Ptolemy; others in such a year of the epocha of Nabonassar, that we cannot err in our calculations an hour, much less an intire day. By this therefore we shall fix the time of Zedekiah, and the destruction of the temple: And consequently, if, by our continuation of the years mentioned in the sacred story, it shall appear, that from the time of Moses, either to the first olympiad, or to Zedekiah and the destruction of the temple, there cannot be so great a distance as these suppose, we may safely then conclude, that Moses lived not in the time of this Tetbmosis, and is not so ancient as Josephus makes him; and that these shepherds were not the Israelites, but very probably Arabians, as Manethos here also reports. Some say that these were Arabians; who to this day, for the greatest part, like the Nomades, wander up and down, feeding their cattle, and often make incursions upon the Egyptians and Syrians. Which occasioned Sesostris the great (as we find it in Diodorus,) to make a wall on the east-side of Egypt, a thousand and fifty furlongs in length, from Pelusium by the desert to Heliopolis, against the invades of the Syrians and Arabians: As at this day the Chinese have done against the irruptions of the Tartars on the north and west parts of China, for many hundred miles, the which appears by a large map of mine of that country, made and printed in China. On the contrary, if the succession of times from Moses, recorded in the holy writ, better agrees with the age of Amenophis, the father of Ramesses, whose story Josephus hath preserved out of Manethos, and whose time and rank in the Dynasties, Africanus and Eusebius deliver out of the same Manethos, we may with more probability affirm, that the migration of the Israelites and time of Moses, was when Amenophis was Pharaoh, or king of Egypt, than that it was when Tetbmosis reigned, as Josephus and others contend, out of a desire to make Moses ancients than in truth he is.

<sup>4</sup> Exod. i. 14. <sup>5</sup> Josh. xv. 63. <sup>6</sup> 2 Chron. xi. 4, 5. <sup>7</sup> In oratione contra Græcos. <sup>8</sup> In parenthetico ad Græcos. <sup>9</sup> Lib. 1. Strom. <sup>10</sup> And so doth St. Augustin, eduxit Moïsem ex Ægypto populum Dei novissimo tempore Cecropis, Atheniensium regis. L. 18. c. 11. de Civ. Dei. <sup>11</sup> Euseb. Chron. <sup>12</sup> Ibid. <sup>13</sup> Ptolemæus in γεωγραφικῇ ἐπιστάσει. <sup>14</sup> Diod. Sic. lib. 1. <sup>15</sup> Joseph. lib. 1. contra Apionem.

And tho' this argument from the series and successions of time is so demonstrative and conclusive, that nothing can be opposed against it, and therefore might be sufficient to evince our purpose: yet if we considerately examine another relation of *Manethos*, (which is slighted and depressed by *Josephus*, because it made not for his purpose,) it must necessarily be that those shepherds he meant not the *Israelites*, but rather by the *Israelites* the leprous people, which in his computation are three hundred thirty years and six months after the Dynasty of the shepherds. And therefore we may oppose the authority of *Manethos* against himself, or rather against *Josephus*. The sum of whose discourse is this, That *Amenophis*, who was a great worshipper of the gods, as *Orus* one of the former kings had been, being desirous to see the gods, one of the priests of the same name with him, told him he might, if he cleansed the country of leprous and polluted people. This leprous people chose for their captain one of the priests of *Heliopolis*, named *Osarsiphus*, who changing his name, was called *Moses*; he causing *Amenophis* for fear to fly into *Æthiopia*, was afterwards by him, and by his son *Setbon*, who was also called *Rameses*, by the name of his father overthrown in battle, and the leprous people were pursued by them unto the confines of *Syria*. Thus far out of *Manethos*. Here, which is very remarkable, we have expressly the name of *Moses*; whereas in the former relation of *Manethos* there is no mention of him, but of six other kings, with their peculiar names. Whereas it is not probable he would have omitted the name of *Moses* if he had lived in that age, being a name so famous and so well known to them; and by *Josephus* acknowledged, that the *Ægyptians* accounted him to be an admirable and divine man. The pursuing of them unto the confines of *Syria*, doth very well intimate the following of the *Israelites* by *Pharaoh* and his host. For his terming them a leprous and polluted people, we must consider him to have been an *Ægyptian*, and therefore not unlikely to throw as many aspersions as he could upon the *Israelites*, whom they deadly hated, it may be out of memory of their former plagues.

However it were, *Charemon* hath almost the same history, as *Josephus* confesses. *Charemon* professing to write the history of *Ægypt*, says, That under *Amenophis* and his son *Rameses*, Two hundred and fifty thousand leprous and polluted men were cast out of *Ægypt*. Their leaders were *Moses* the scribe, and *Josephus*, who was also a sacred scribe. The *Ægyptian* name of *Moses* was *Tisithen*, of *Joseph* *Peteleph*. These coming to *Pelusium*, and finding there three hundred and eighty thousand men left by *Amenophis*, which he would not admit into *Ægypt*, making a league with them, they undertook an expedition against *Ægypt*. Upon this *Amenophis* flies into *Æthiopia*, and his son *Messenes* drives out the *Jews* into *Syria*, in number about two hundred thousand, and receives his father *Amenophis* out of *Æthiopia*. I know *Lyfimachus* assigns another king, and another time, in which *Moses* led the *Israelites* out of *Ægypt*, and that was when *Bocchoris* reigned in *Ægypt*, the nation of the *Jews* being infected with leprosy, and scabs, and other diseases, betook themselves to the temple to beg their living, many being tainted with the disease, there happened a death in *Ægypt*. Whereupon *Bocchoris* consulting with the oracle of *Ammon*, received answer, That the leprous people were to be drowned in the sea in fleets of lead, the scabbed were to be carried into the wilderness; who choosing *Moses* for their leader, conquered that country which is now called *Judæa*. Out of which relation of *Lyfimachus*, and some others of like credit, *Tacitus* may have borrowed his in the fifth book of his histories. Most authors agree, that there arising a contagion in *Ægypt* which defiled their bodies, king *Bocchoris* consulting the oracle of *Hammon* for remedy, was bid to purge his kingdom, and to carry that sort of men, as hated of the gods, into other countries. Thence the vulgar sort being enquired after, and collected together, after they had been left in the deserts, the rest being heavy with tears, *Moses*, one of the banished men, admonished them, not to expect the help either of gods or men, being deserted by both, but that they should trust to him as their captain sent from heaven, to whose assistance by their giving credit at the first, they had overcome

<sup>d</sup> *Tacit.* l. 5. Hist. *Plurimi auctores consentiunt, erit per Ægyptum tabe quæ corpora fœdaret: regem Bocchorin, adito Hammonis oracula, remedium petentem, purgare regnum, & id genus hominum ut invisum deis alias in terras avolvere iussim.* Sic conquestum collectumque vulgus, postquam vastis locis relictum sit, ceteris per la-brynas serpentinibus, Moysen unum exulium monuisse, ne quam deorum hominum opem expectarent ab utrisque desertis, sed sibi ut duci caelesti crederent, primo cuius auxilium credentes præsentis miseriae pepulissent. Affertur atque omnium ignari fortissimum iter incipiunt.

*GRAEVES* their present calamities. They assented unto him, and being ignorant of all, they begin their journey as fortune should lead them. Thus much and more hath Tacitus of Moses and the Jews. But to pass by his and *Lysimachus's* calumnies, we can no more assent to these testimonies of theirs, that *Moses* lived in the time of *Bocchoris*, than we did to *Josephus* that he was coetaneous with *Teibmosis*. For we find *Bocchoris* to be placed by *Africanus* and *Eusebius*, both following *Manethos* in the twenty fourth dynasty, and by *Diodorus* long after *Sesestris* the great, or *Rameses*, which *Rameses*, or *Seibosis*, or *Setbon*, (that is, *Sesestris*, and *Sesosis* in *Diodorus*,) both in *Manethos* and *Charemon*, is the son of *Amorophis*, who is the last king of the eighteenth dynasty, according to *Africanus* and *Eusebius*. I purposely omit the opinion of *Apian*, that *Moses* (whom he makes to be of *Helopolis*,) departed with these lepers, and blind, and lame, in the first year of the seventh olympiad, in which year, saith he, the Phœnicians built Carthage; and that other of *Porphyrius* in his fourth book against the Christians, that *Moses* was before *Semiramis*. Where he places him as much too high, as *Apian* doth too low.

Laying therefore aside these vain and uncertain traditions, we have no more assured way exactly to fix the time of *Moses*, and by *Moses* the time in which the Pyramids were built, than to have recourse to the sacred scriptures, and sometimes to compare such authors of the Gentiles with these, against whom we have no just exceptions. For by those, and these conjointly, we may continue his time to the first olympiad, and thence to the destruction of the temple, by *Nebuchadnezzar* king of *Babylon*: That of the olympiads being a most certain and known epocha with the Greeks, as that of the destruction of the temple with the Jews. From *Moses* then, or the migration of the Israelites out of *Egypt*, to the building of *Solomon's* temple, are *ccccxxx* years current, or

four hundred seventy nine complete; and so also *Eusebius* computes them. The words of the text plainly conclude this sum: "And it came to pass in the four hundred and fourth-score year, after the children of Israel were come out of the land of *Egypt*, in the fourth year of *Solomon's* reign over Israel, in the month *Zif*, which is the second month, that he began to build the house of the Lord. From the building of the temple to the destruction of it in the reign of *Zedekias*, by the calculation and confession of the best chronologers, are betwixt four hundred and twenty and four hundred and thirty years. Which is thus deduced: After the first foundation of the temple, *Solomon* reigned thirty seven years, *Rehoboam* with *Abia* twenty; in whose time we are to place *Shishak*, or *Sesobosis*, the king of *Egypt*. "And it came to pass in the fifth year of king *Rehoboam*, that *Shishak* king of *Egypt*, came up against *Jerusalem*, and he took away the treasures of the house of the Lord, and the treasures of the king's house, he even took away all; and he took away all the shields of gold which *Solomon* had made. This *Shishak* is named by the *Septuagint* *Σισακ*, by *St Hieron* *Sesac*, and is the same whom *Josephus* calls *Σισακ*, which he imagines to have been *Sesestris* the great, whose victories and conquests are describ'd at large by *Herodotus*. But this *Sesestris*, or *Sesosis*, as *Diodorus* also terms him, must long have preceded *Rehoboam's* time, as in the sequel of this discourse it will appear. Therefore the more probable opinion is that of *Scaliger*, that by *Shishak* is meant *Sesobosis*, whom *Manethos* calls *Σισοβυς*, and the scoliast of *Apollonius* *Σισοβυς*, the time of the twenty second dynasty, in which we find him placed by *Africanus* and *Eusebius*, doth well agree with it, and the radical letters in *Shishak*, *Sesac*, and *Σισακ*, being the same, do very much strengthen our assertion. After *Rehoboam* and *Abia's* reign, *Asa* and *Jeboas* reigned *lxxvi* years, *Joram* and *Abazias* *ix*, *Abazias* and *Joas* *xlv*, *Amasias* *xxix*, *Uzziah* *lvi*, *Jotham* *xvi*, *Ahaz*

xvi, being contemporary with *Hoshea* the last king of *Israel*, in whose time we find *So* to reign in *Egypt*, (2 Kings xvii. 4.) After *Abaz* succeeded, *Hezekiah* reigning 1 xxix years

Now <sup>1</sup> in the fourteenth year of king *Hezekiah*, did *Sennacharib* king of *Assyria*, come up against all the fenced cities of *Judah*, and took them. But afterwards, when he came to besiege *Jerusalem* — <sup>2</sup> It came to pass that night, that the angel of the Lord went out and smote in the camp of the *Assyrians* an hundred fourscore and five thousand; and when they arose early in the morning, behold, they were all dead corpses. So *Sennacharib* king of *Assyria* departed, and went, and returned and dwelt at *Nineveh*. In the time of this *Sennacharib*, *Seibon* succeeding *Anysis* reigned in *Egypt*, according to <sup>3</sup> *Herodotus*, who in his *Euterpe* hath plainly the name of *Sanacharib*, siliing him king of the *Arabians* and *Assyrians*, and making him to have received a miraculous defeat, which it may be was that of *Hezekiah*, though he applies it to *Seibon* king of the *Egyptians*. His story is well worth our observation; which runs thus: "After this (Anysis) the priest of *Vulcan*, by name *Sethon*, reigned, who abusing the men of war of the *Egyptians*, and condemning them as not useful to him, besides other ignominies he deprived them of their lands, which had been given to every company of twelve by the former kings. Wherein it happened, that when afterwards *Sanacharib*, the king of the *Arabians* and *Assyrians*, invaded *Egypt*, the *Egyptian* soldiers refused to assist him. Then the priest destitute of counsel, stout himself up, lamenting before the image how much he was in danger to suffer; in the midst of his mourning falling asleep, a God appeared to him, encouraging him that he should suffer no distress, if he would march against the armies of the *Arabians*; for he would send him succour.

He therefore giving credit to this dream, taking with him such volunteers of the *Egyptians* as followed him, pitched his army at *Belusium*; for there *Egypt* is easiest invaded: Neither did any of the soldiers follow him, but trades-men, and artificers, and merchants. Coming thither by night, an infinite number of mice entering upon his enemies, gnawed their quivers and bows, and the leathers of their shields, so that the next day the enemies destitute of arms, fled, many of them being slain. And therefore now this king stands in the temple of *Vulcan*, in a statue of marble, holding in his hand a mouse with this inscription. He that looks upon me let him be religious. After *Hezekiah*, <sup>4</sup> *Manasses* reigned 1 v years, <sup>5</sup> *Amon* 11, <sup>6</sup> *Josiah* xxxi. "In his days *Pharaoh* *Nechoh* king of *Egypt*, went up against the king of *Assyria* to the river *Euphrates*, and king *Josiah* went against him, and he slew him at *Megiddo* when he had seen him. The same relation we read in *Herodotus*, if we pardon him the mistake of *Magdolo* for *Megiddo*, who writes, that <sup>7</sup> *Necus* (the king of *Egypt*) fighting a battle on land with the *Syrians* in *Magdolo*, obtained the victory, and after the fight he took *Cadytus*, a great city in *Syria*.

Next to *Josiah* succeeded <sup>8</sup> *Joachaz*, <sup>9</sup> *Jehoiakim*, and <sup>10</sup> *Jechoniah* or *Jehoiachin*, reigning eleven years and six months. And in the eleventh year of <sup>11</sup> *Zedekiah*, the next king after *Jechoniah*, was the temple burnt by *Nebuzaradan*, in the 19 nineteenth year of *Nebuchadnezzar* king of *Babylon*, or the second of *Vaphres* king of *Egypt*, in the computation of *Clemens Alexandrinus*. This *Zedekiah*, saith <sup>12</sup> *Josephus*, having been a confederate of the *Babylonians* for eight years, broke his faith with them, and joining league with the *Egyptians*, hoped to overthrow the *Babylonians*. This league we find intimated in <sup>13</sup> *Ezekiel*; and we read in <sup>14</sup> *Jeremiah* and <sup>15</sup> *Josephus* of succours

<sup>1</sup> 2 Kings xviii. 2. He reigned twenty nine years in Jerusalem.

<sup>2</sup> 2 Kings xix. 35, 36.

<sup>3</sup> Herod. lib. 2. *Sanacharib*, &c.

<sup>4</sup> 2 Kings xxii. 19. He reigned two years in Jerusalem.

<sup>5</sup> He reigned thirty one years in Jerusalem.

<sup>6</sup> 2 Kings xxiii. 29. and Chron. xxxv. 20. *Necho* king of *Egypt*, came up to fight against *Carchemish* by *Euphrates*, and *Josiah* went out against him.

<sup>7</sup> *Ezek. i. ver. 5, 6, 7, 12, 13.* almost word for word, which is remarkable.

<sup>8</sup> 2 Kings xxiii. 31. He reigned three months in Jerusalem.

<sup>9</sup> 2 Kings xxiv. 8. He reigned in Jerusalem three months.

<sup>10</sup> And the city was besieged unto the eleventh year of king *Zedekiah*. And on the ninth day of the fourth month the famine prevailed in the city, and there was no bread for the people of the land: and the city was broken up, and all the men of war fled by night.

<sup>11</sup> And in the fifth month on the seventh day of the month (which is the nineteenth year of *Nebuchadnezzar* king of *Babylon*), came *Nebuzan*, captain of the guard, a servant of the king of *Babylon*, unto *Jerusalem*. And he burnt the house of the Lord, and the king's house, and all the houses of *Jerusalem*, and every great man's house burnt he with fire, 2 Kings xxv. 2, 3, 4, 8, 9. The same relation we find in *Jeremiah*, chap. lii. ver. 5, 6, 7, 12, 13. almost word for word, which is remarkable.

GREAVES and assistance sent by the king of Egypt, when Zedekiah and Jerusalem were first distressed by the Chaldeans, or forces of the king of Babylon. <sup>d</sup> Then Pharaoh's army was come forth out of Egypt, and when the Chaldeans that besieged Jerusalem, heard tidings of them, they departed from Jerusalem. The same is reiterated by him: Behold Pharaoh's army which is come forth to help you, shall return to Egypt to their own land. And the Chaldeans shall come again, and fight against this city, and take it, and burn it with fire. All which we see was perform'd by Nebuchadnezzar in the eleventh year of Zedekiah; and a judgment also denounced against the king of Egypt. \* Thus saith the Lord, Behold, I will give Pharaoh Hophra king of Egypt, into the hands of his enemies, and into the band of them that seek his life: as I gave Zedekiah king of Judah, into the band of Nebuchadnezzar king of Babylon, his enemy, and that fought his life. The same is often threatned by the prophet Ezekiel, who lived in the time of Hezekiah, as Jeremiab did: I am against Pharaoh king of Egypt, and I will scatter the Egyptians among the nations, and will disperse them throughout the countries: And I will strengthen the arms of the king of Babylon, and put my sword in his hand, but I will break Pharaoh's arms. Which prophecies we may discover most manifestly to have been fulfilled in the reign of Apries, as <sup>e</sup> Herodotus names him, or Apries, as <sup>f</sup> Diodorus calls him, or Vapbres, as the Septuagint and Eusebius render the name of that king, which here in Jeremiab is called Pharaoh Hophra. Who, saith <sup>g</sup> Herodotus, next to Psammiticus his grandfather, was the most fortunate of all the former kings for twenty five years of his reign; which might occasion Zedekiah to fly to him for succour: But the Egyptians rebelling against him, he was overthrown in battle, taken prisoner, and afterward strangled by his own servant Amasis, whom they had made their king. The whole story and manner is at large in <sup>h</sup> Herodotus, neither did divine vengeance long forbear to pursue the traitor. For Cambyses the king of the Persians and of Babylon, coming with an army against him, possessed himself of Egypt, as the prophets had foretold. Nor could the Egyptians ever to this day recover the monarchy. For after the Persians succeeded the Macedonians, after them the Romans, then the Arabians, next the Mamalukes or Circassians, and last of all the Turks or Sy-

rians. So that we may conclude from the occurrences then happening, (the relations of Herodotus exactly agreeing with the threatenings of the prophets,) as also from the computation of times, and from the affinity and analogy of names, that Hophra, and Apries, or Vapbres, must have been the very same Egyptian king coetaneous and concurrent with Zedekiah.

To reassume then what hath been demonstrated by us: From the migration of the Israelites out of Egypt, under the conduct of Moses to the building of Solomon's temple, are four hundred seventy nine years complete; and from the building of the temple to the destruction of it, are four hundred and thirty years and six months. But because it is not probable, that amongst so many kings, all of them should have reigned completely so many years as are express'd in the text; it being the usual stile of kings to reckon the years current of their reign as complete, I shall limit this uncertainty between ccccx and ccccxix years, which is a sufficient latitude. If any one should desire a more exact calculation, he may compute them by comparing other places of the scriptures with these, to be but ccccxv years current, according to the opinion of the most reverend and judicious primate of Ireland, to which I willingly subscribe; though either computation be sufficient for my purpose.

This destruction of the temple, by our best chronographers, is placed in the first year of the forty eight olympiad, and in the hundred and sixtieth of the epocha of Nabonassar, and in the nineteenth (as the scripture often makes mention) of Nebuchodonosor the son of Nabonassar, (as <sup>i</sup> Berossus in Josephus names him,) which Nabonassar must necessarily be the same with him that is called Nabopolassar in Ptolemy, (the xiv king of the Babylonians after Nabonassar,) whom Nabopolassar (or <sup>m</sup> Nabuchodonosor, or <sup>n</sup> Nebuchadnezzar, or <sup>o</sup> Nebuchadnezzar, as the scripture also terms him,) in his Canon Regnorum succeeds. The nearness of the names, and agreement of the times from Cyrus, in whom the sacred scriptures and prophane authors equally concur, do strongly prove them to be the same. Wherefore we may conclude, that from the time of Moses, or the migration of the Israelites out of Egypt, or from the end of the Ammonites, (coetaneous with Moses,) the last king of the eighteenth Dynasty, (as Eusebius out of Manethos ranks him,) to the

reign of Apries, or Vapres, or Hophra, the eighth king of the twenty sixth Dynasty, (according to the same Eusebius following Manetbos,) being coetaneous with Zedekiah king of Judah, and Nebuchadnezzar king of Babylon, are 13000000 years, and from Moses to the first olympiad 13000000 and not 13000000 as they who make Moses as ancient as Inachus affirm. In which space we may with much certainty, if we give credit to Herodotus and Diodorus, place the kings the founders of the three greatest and fairest Pyramids; which is the principal intention of this discourse. For both of them describe these to have reigned many ages before Apries, and long after Sesostris the great. Which Sesostris, or Sesostris, as Diodorus also styles him, must have been the same king whom Manetbos in Josephus calls Setosis, and Ramefies, and <sup>4</sup> Egyptus, son to Amenophis before-mentioned, and brother to Armais, or Danaus; and Eusebius of Scaliger's edition in Greek names Setosis, the Latin translations of St. Hierom, both MSS. and printed copies Setbus, and by all of them is the first king of the xix Dynasty. The great acts and conquests assigned by Herodotus to Sesostris, and as great attributed by Manetbos to Setosis, or Ramefies, which cannot well be applied to any other precedent or subsequent kings; together with the relation of them both, that while he was in pursuit of his victories abroad, his brother, whom Manetbos names Armais, and Danaus (in Herodotus his name is omitted,) rebelled against him at home, and the nearness of the time, which may be collected out of both, do very much confirm the probability of this assertion. Sesostris then, and Setosis, being one and the same, is by Manetbos in Josephus ranked immediately after Amenophis, (coetaneous with Moses, as we have prov'd,) and is the same Manetbos in the tradition of Eusebius after Menophis that is Amenophis, both in the Greek and Latin copies. Wherefore the founders of these Pyramids having lived after Sesostris, must likewise have been after Amenophis. If we will come to a greater preciseness yet of time, (for this latitude of nine hundred and four

years, which we assigned from Moses to the Graves destruction of the first temple, in the time of Zedekiah king of Judah, and Apries king of Egypt, is so great that we may lose our selves in it,) we have no other possible means left, after the revolution of so many ages, and the loss of so many of the commentaries and monuments of the Egyptians, but by having recourse to those Dynasties of Manetbos, as they are preserved by Africanus and Eusebius. And yet in neither of these shall we find the names of Cbeops or Chemmis, or Cepren or Chabryis, or of Mycerinus, the authors of the greater Pyramids, mentioned by Herodotus and Diodorus; or of Asychis, the builder of a fourth, according to Herodotus. Wherefore what their writings have not supplied us with, that reason must. For since these Egyptian kings, as we have proved, lived between Amenophis and Apries, and by Eusebius out of Africanus, Amenophis is the last of the xviii Dynasty, and Apries or Vapres, the viii of the xxvi Dynasty, we must necessarily place them in one of the intermediate Dynasties. But seeing all the intermediate Dynasties have their peculiar kings, unless it be the xx, we have no reason to exclude them, and to bring these in their places as usurpers: But rather with great probability, (for I must say here with Livy, *Quis rem tam veterem pro certo asserimet?*) we may assign to them the xx Dynasty. In which we find not the name of any one king, but yet the space left vacant of 13000000 years, according to Eusebius.

Here therefore we shall place,

First, Cbeops or Chemmis, the founder of the first Pyramid, who began his reign in the 13000000 cccc xlviii year of the Julian period, that is cccclxxx years before the first olympiad, and 13000000 before the first destruction of the temple, and 13000000 before the beginning of the years of our Lord. He reigned fifty years, saith Herodotus, and built this Pyramid, as Diodorus observes, a thousand years before his time, or the 1300000 olympiad, whereas he might have said a thousand two hundred and seven.

<sup>1</sup> Herodot. lib. 2. Diodor. Sic. lib. 1.

<sup>2</sup> *Ἰστορίαι τῶν Ἑλλήνων* τῶν πρίντων, Ἀρμαῖος ὁ ἐκ τῆς Ἀφρικῆς αὐτοῦ Δαναῖος. Manethos apud Jos. l. 1. contra Apionem. Where in the same place Manetbos calls this *Ἰστορία*, also *Ῥωμαίων*, and son of Amenophis; and therefore Scaliger rightly observes, that Ramefies with Manetbos is Trionimis. *Scal. in Euseb. Chron.*

<sup>3</sup> This Danaus (for his rebellion, being expelled by his brother out of Egypt,) sailed into Greece, and possessed himself of Argos, as it is testified by Josephus, (lib. 1. contra Apionem,) by Africanus and Eusebius, (vid. Euseb. chron.) by Pausanias, and several others. From whom descended the Danaides, one of the races of the kings at Argos; of all which there is frequent mention in the Greek historians and chronographers: Wherefore we cannot be ignorant either of Danaus or of his brother's time. I shall only add, for farther illustration, what I find in Africanus, Ἀρμαῖος ὁ ἐκ τῆς Ἀφρικῆς ὁ ἀδελφεὸς τοῦ Ἰστορίου τοῦ καὶ Ἀφρικῆος ἱστορίου καὶ Ἰστορίου βασιλεὺς αὐτοῦ, οὗ ἑλλὰς τι ἐκτίθειτο. Ῥωμαῖος ὁ ἀδελφεὸς αὐτοῦ ὁ Ἀφρικῆος καλεῖται Ἰστορίου. Ἰστορίου ἑλλὰς ἑκτίθειτο. Μεταστάσεις τῶν χρόνων Ἀφρικῆος τῶ Ἰστορίου ἑκτίθειτο, ἡ τι πρότερον Μετὰ τῶν ἑλλὰς δὲ Ἀφρὶ ἀνέστητο Δαναῖος δὲ ὁ καὶ Ἀρμαῖος πρῶτος τῶ Ἀργεῖ, ὃ ἐκ τῆς Ἀφρικῆς ἐκτίθειτο τῶ Ἀργεῖ, καὶ ἐκ τῆς Ἀφρικῆς αὐτοῦ μετὰ αὐτοῦ Δαναῖος καλεῖται, ὃν ἑλλὰς τῶ Ἰστορίου τῶ Ἰστορίου, καὶ οὗ ἐκ τῆς Ἀφρικῆς. Afr. apud Euseb. chron.

<sup>4</sup> Liv. l. 1.

Secondly, *Cephren* or *Cbabryis*, the builder of the second, who reigned fifty six years.

Thirdly, *Mycerinus*, the erecter of the third, seven years.

Fourthly, *Ayebis* the author of the fourth.

Fifthly, *Anysis* the blind.

How long these two reigned is nowhere expressed.

Sixthly, *Sabacbus* the *Ethiopian*. He conquered *Egypt*, and reigned fifty years.

The sum is *CLXIII* years, this being subtracted out of *CLXXVIII* years, (the whole time allowed by *Eusebius* to this *Dynasty*;) the remainder is *XY* years, which space we may without any inconvenience, divide between *Ayebis* and *Anysis*.

If any shall question why the names of these kings are omitted by *Manethos*, an *Egyptian* priest, in the *XX* *Dynasty*, I can give no other reason than what we read in *Herodotus*: 'These kings (speaking of *Cheops* and *Cephren*;) the *Egyptians* out of hatred will not so much as name, but they call them the *Pyramids* of *Phibition* a shepherd, who in those times, at that place, fed his cattle. The which hatred, occasioned by their oppressions, as *Diodorus* also mentions, might cause him to omit the rest, especially *Sabacbus*, an *Ethiopian*, and an usurper.

Following this computation of *Eusebius* of *CLXXVIII* years for the *XX* *Dynasty*, and not that of *Africanus*, who assigns only an *CCXV*, of whom *Joseph Scaliger* hath this censure, *In istis Dynastiis, aliquid turbasse videtur Africanus, ut consideret rationibus suis*; it will follow by way of consequence, as the most reverend and learned *primate of Ireland*, in his *Chronologia Sacra* hath singularly well observed.

First, That the *XVIII* *Dynasty* ends with the migration of the *Israelites* out of *Egypt*, and with the death of *Amenophis*; which is clearly signified by *Manethos*,

and the times of *Belus* and *Danans*, noted by the *Greek* chronographers, do evidently confirm it. I mean the *Egyptian* *Belus* or *Amenophis*, the father of *Egyptus*, or *Setheps* and *Danans*, not the *Babylonian* *Belus* the father of *Ninus*, whom *Mythologists* confound with this, feigning him to have transported colonies out of *Egypt* to *Babylon*. The time allotted by *Thallus*, an ancient chronographer, to *Belus* of *ccc* *xx* years before the *Trojan* war, doth exactly agree with this *Egyptian* *Belus* or *Amenophis*.

Secondly, That the *XX* *Dynasty* will receive those six kings, which out of *Herodotus* we have placed there; the number of whose years exceed the time limited by *Africanus*.

Thirdly, That the *XXII* *Dynasty* will fall upon the latter time of king *Solomon*, whereby *Sejonebis* the first king of it, may be the same with *Sesac*, or *Sibbac*, who in the fifth year of *Rehoboam*, the son of *Solomon*, invaded *Judea*; which was the only reason that moved *Scaliger* to suspect, that something had been altered by *Africanus* in these *Dynasties*.

By the same series and deduction of times, we may conclude, that the *labyrinth* adjoining to the *Pyramid* of *Osmandus*, raised by a common expence of the *XII* kings, who succeeded *Seton* to have been *etc etc cccxxiv* years since, to *CLXXX* before *Christ*. For *Seton* living in the time of *Sennacharib*, and these immediately following *Seton* in the government of the kingdom, they must have reigned either in the same age the scripture assigns to *Sennacharib*, or not long after.

Those other *Pyramids*, the one of *Osmandus* in *Diodorus*, or *Ismandes*, in *Strabo*; and those two of *Meris*, or *Myris*, in *Herodotus*, and *Diodorus*, it is evident they preceded *Sejostris* the great, and must therefore have been above three thousand years since, but by how many kings or how many ages, is hard to be defined.

<sup>a</sup> Herod. lib. 2. Diodor. lib. 1. <sup>b</sup> Ibid. <sup>c</sup> Τούτους ἰσὶ μέγας ἡ καταστάσις. Αἰγύπτου ἐννοεῖται, ἀλλὰ ὅτι τὰς πυραμίδας καλεῖται παρὰ τὸν Φιλιππίου, ὅτι ἔχον τὸ χρῆμα ὡς οὐκ ἐπὶ ταῦτα ταχυτά. Herodot. lib. 2. <sup>d</sup> Diodor. lib. 1. <sup>e</sup> Scalig. in Euseb. chron. <sup>f</sup> Kings xiv. 25, 26. <sup>g</sup> Scalig. in Euseb. chron. <sup>h</sup> Herodot. lib. 2. <sup>i</sup> Diodor. lib. 1. <sup>j</sup> Strabo, lib. 17.

Of the end or intention of the PYRAMIDS, that they were for sepulchres; where, by the way is expressed, the manner of embalming used by the ÆGYPTIANS.

THAT these Pyramids were intended for sepulchres and monuments of the dead is the constant opinion of most authors, which have writ of this argument.

<sup>a</sup> Diodorus expressly tells us, that Chemmis and Cephren, although they designed (these two greater) for their sepulchres, yet it happened that neither of them were buried in them.

<sup>b</sup> Strabo judges all those near Memphis to have been the sepulchres of kings. Forty stadia from the city (Memphis,) there is a certain brow of an hill in which are many Pyramids, the sepulchres of kings. And in particular he calls another near the lake of Maris, the sepulchre of Imandes. To which also the writings of the Arabians are consonant, who make the three greater the monuments of Saurid, Hougib, and Fazfarinoun. And the Sabæans the first of them, the sepulchre of Seb, the second of Hermes, the third of Sab, from whom they suppose themselves denominated Sabæans, as we formerly mentioned. And if none of these authorities were extant, yet the tomb found in the greatest Pyramid to this day of Cheops, as Herodotus names him, or Chemmis, according to Diodorus, puts it out of controversy. Which may farther be confirmed by the testimony of Ibn Abd Albokm an Arabian, where he discourses of the wonders of Ægypt, who relates that after Almamon the calif of Babylon, had caused this Pyramid to be open'd [about eight hundred years since,] <sup>d</sup> they found in it towards the top a chamber, with an hollow stone, in which there was a statue like a man, and within it a man, upon whom was a breast-plate of gold set with jewels, upon this breast-plate was a sword of inestimable price, this sword, and at his head a carbuncle of the bigness of an egg, shining like the light of the day, and upon him were characters writ with a pen, which no man understood.

But why the Ægyptian kings should have been at so vast an expence in the building of these Pyramids, is an enquiry of an higher nature. <sup>e</sup> Aristotle judges them

to have been the works of tyranny: And Pliny conjectures, that they built them, partly out of ostentation, and partly out of state-policy, by keeping the people in employment, to divert them from mutinies and rebellions. <sup>f</sup> Regum pecunia otiosa, ac stulta ostentatio. Quippe cum facienda eas causa a plerisque tradatur, ne pecuniam successoribus, aut amulsi insidiantibus praberent, aut ne plebs esset otiosa.

But the true reason depends upon higher and more weighty considerations; though I acknowledge these alledged by Pliny might be secondary motives. And this sprang from the theology of the Ægyptians, who, as Servius shews in his comment upon these words of <sup>g</sup> Virgil, describing the funeral of Polydorus,

—Animamque sepulchro  
Condimus.—

believed, that as long as the body endured, so long the soul continued with it, which also was the opinion of the <sup>h</sup> Stoicks. <sup>i</sup> Hence the Ægyptians skilful in wisdom, do keep their dead embalmed so much the longer, to the end that the soul may for a long while continue, and be obnoxious to the body, lest it should quickly pass to another. The Romans did the contrary, burning their dead, that the soul might suddenly return into the generality, that is, into its own nature. Wherefore that the body might not, either by putrefaction be reduced to dust, out of which it was first formed, or by fire be converted into ashes, (as the manner of the Græcians and Romans was) they invented curious compositions, besides the intombing them in state-ly reconditories, hereby endeavouring to preserve them from rotteness, and to make them eternal. <sup>k</sup> Nec cremare, aut fodere fas putant, verum arte medicatos intra penetralia collocant, faith Pomponius Mela: And Herodotus gives the reason why they did neither burn nor bury. For discoursing, in his third book, of the cruelty of Cambyzes, and of his commanding that the body of

**GRAVES** *Amasis*, an Egyptian king, should be taken out of his sepulchre, whipt, and used with all contumely, he reports, that after all he bid it to be burnt, "commanding that which was not holy. For the Persians imagine the fire to be a god, and neither of them are accustomed to burn the dead body. The Persians for the reason before alledged, because they conceive it waiting for a god to devour the carcass of a man; and the Egyptians, because they are persuaded the fire is a living creature, devouring all things that it receives, and after it is satisfied with food, dies with that which it hath devoured. Nor is it their custom of giving the dead body to beasts, but of embalming (or salting) it, not only for this reason, but that it may not be consumed with worms. The term used by Herodotus ταρχυν, of salting or embalming the dead, is also used by *Baruch* and by *Plato*, and by *Lucian* in his discourse de luctu, treating of the several sorts of burial practised by several nations. \* The Grecian doth burn [the dead] the Persian bury, the Indian doth anoint with the fat of swine, the Scythian eat, and the Egyptian ταρχυν, embalm, (or powders.) Which manner also is alluded to by Antoninus under the word ταρχυν, † that which the other day was excrementitious matter, within few days shall either be ταρχυν, an embalmed body, or meer ashes: In the one expressing the custom of the Egyptians, in the other of the Romans, where doctor *Casaubone*, the learned son of a learned father, hath rightly corrected the errors of those who render ταρχυν to be a certain sort of fish. By this means then salting the body, and embalming it, (the manner of both we shall describe out of Herodotus and Diodorus,) the soul was obliged (according to the belief

of the Egyptians) to abide with the body, and the body came to be as durable as marble. Inasmuch as *Plato*, who lived in Egypt with *Eudorus* no less than XIII years, as *Strabo* witnesseth, brings it for an argument in his *Phædon* to prove the immortality of the soul, by the long duration of these bodies. Which surely would have been more conclusive with him, could he have imagined that to these times, that is, till two thousand years after him, they should have continued so solid and intire, as to this day we find many of them. Wherefore *St. Augustin* truly affirms, that the Egyptians alone believe the resurrection, because they carefully preserve their dead corpses. For they have a custom of drying up the bodies, and rendering them as durable as brass; these (in their language) they call Gabbares. Whence the glois of *Isidore*, Gabbares mortuorum, in *Vulcanius*, his edition; or as *Spondanus* reads Gabbares mortuorum condita corpora.

The manner how the Egyptians prepared and embalmed these bodies, is very copiously, and by what I observed, very faithfully described by Herodotus and Diodorus, and therefore I shall put down their own words: Their mourning, faith, \* Herodotus, and manner of burial are in this kind: When any man of quality of the family is dead, all the women besmear their heads and faces with dirt, then leaving the body with their kindred, they go lamenting up and down the city with their kinsfolks, their apparel being girt about them, and their breasts naked. On the other side, the men having likewise their cloaths girt about them, beat themselves. These things being done, they carry it to be † embalmed. For this there are some appointed, that profess the art; these, when the body is brought to

\* Herodot. lib. 3. Ἐταλλόμεθα δὲ τῷ σώματι. Πόρην γὰρ οὐκ ἀποτίνομεν οὐδὲν τὸ σῶμα, &c.

† This barbarous custom is still practised in the East-Indies, as *Teisner* (who from his own travels, and the writings of *Emir Coni*, a Persian, hath given us the best light of those countries) truly informs us. Wherefore, we may give credit to that of *Tully*: *Magorum mos est non damare corpora suorum, nisi à feris sint antea laniata. In Hyrcania plebs publicis aliis canes, optimates domesticos, (Nobile autem genus canum illud scimus esse,) sed pro sua quisque facultate parat, à quibus laniatur, eamque optimam illi esse censent sepulcrum.* *Tulc.* q. 1. 1. † *Baruch* vi. 71. † *Plat. Phædon.* † *Lucian de Luctu.*

‡ O μὲν ἄλλοι τὸ σῶμα τὸ ἐν τῷ τάφῳ καταλείβουσιν, ὡς δὲ τὰ ἱερὰ ἀνθρώπων, ταρχυνὴν δὲ ἐκρίβουσιν. † *M. Aurel. Anton. lib. 4.* Ἐγὼ δὲ μὴ ταρχυν, οὐκ ἐκ τῶν ταρχυν δὲ τῶν. † *Casaub. ann. in lib. 4. M. Aurel. Anton.* † *Strabo, lib. 17.* † *Ægyptii vero soli credunt resurrectionem, quia diligenter curant cadavera mortuorum, morem enim habent siccare corpora, à quibus artem reddere, Gabbares ea vocant.* *Aug. Serm. 120. De diversis.* † *Spondanus de Cæmet. sacris, lib. 1. par. in c. 3.*

\* Herodotus, lib. 2. Ὁμοῖα δὲ ἐ ταφῇ σφίον ἀνὴρ αἰδῶ, &c.

† Amongst these embalmed bodies are found Egyptian idols, *Omni-genusque Deum monstra, & lastrator Anubis*, to use *Virgil's* expression, (*Æn.* 8.) Some of these are in great, some in little portraictures, formed either with potters earth baked, or else of stone, or metal, or wood, or the like; in all which kinds I have bought some. One of them for the rarity of the matter, and for the illustration of the scriptures deserves to be here mentioned; being cut out of a magnes, in the form and bigness of the *magus*, or *scarabæus*; which as *Plutarch* testifies, was worshipped by the Egyptians, and was by military men engraven as an emblem on their seals. To which sort of idols, it may be *Moses* alluded, when speaking of the gods of Egypt he terms *gallim, stercoreus deus*, † as the original is rendered by *Janius*, and *Tremellius*; for such places are the unfavourable dwellings of the *scarabæus*. That which is remarkable of it in nature is this, that the stone, though probably two thousand years since taken out of its natural bed, the rock, yet still retains its attractive and magnetical virtue.

\* De If. & Osir. τὰς δὲ ταρχυνοῦσιν καὶ ταρχυν: ἢ γὰρ σφίον ἐστὶν αἰδῶ. † Deut. xix. 17. Vidistis adominandos & stercoreos deos illorum.

with the body, durable as marble, lived in A. D. 1311 years, as if for an age the immortal long duration they would have him, could he times, that is, them, they should and mire, as to them. them,

them, shew to the bringers of it certain pat- terns of dead bodies in wood, like it in paint- ing. One of these they say is accurately made, (which I think it not lawful to name,) they shew a second inferior to it, and of an eas- ier price, and a third cheaper than the for- mer. Which being seen, they ask of them ac- cording to what pattern they will have the dead body prepared? When they have agreed upon the price, they depart thence; those that remain, carefully imbalm the body in this manner: First of all they draw out the brain with a crooked iron by the nostrils, which be- ing taken out, they infuse medicaments. Then with a sharp Ethiopick stone they cut it about the bowels, and take out all the guts: these purged and washed with wine made of palm, they again wash with sweet odours beaten; next filling up the belly with pure mirrhe beaten, and cassia, and other odours, except frankincense, they sew it up again; having done this, they salt it with nitre, biding it seventy days, (for longer it is not lawful to salt it;) seventy days being ended, after they

have washed the body, binding it with fillets, (or ribbands,) and wrapping it in a shroud of silk linen, they linear it with gum, which the Egyptians often use instead of glue. The kindred receiving it thence, make a coffin of wood, in the similitude of a man, in which they put the dead body; and being thus in- closed, they place it in a reconditory in the house, setting it upright against the wall. In this manner with great expences they prepare the funerals of their dead. But those who a- voiding too great expences desire a mediocrity, prepare them in this manner. They take a clyster with the juice of cedar, with which they fill the belly by the fundament, neither cutting it, nor taking it out, and salt it so many days, as we mentioned before. In the last of which they take out that (clyster) of cedar out of the belly, which before they in- jected. This bath such efficacy, that it car- ries out with it the whole paunch and entrails corrupted. The nitre consumes it: flesh, and there is only left the skin and bones of the dead body. When they have done this, they restore

<sup>b</sup> Having caused the head of one of the richer sort of these imbalanced bodies to be opened, in the hol- low of the skull I found the quantity of two pounds of these medicaments; which had the confidence, black- nels, and smell of a kind of bitumen, or pitch, and by the heat of the sun waxed soft. This infusion could not well have been made any other way, than as Herodotus here intimates, by the nostrils. The tongue of this imbalanced body being weighed by me, was less than seven grains English. So light was that member, which St. James calls a world of mischief, James iii. 6.

<sup>c</sup> Plutarch writes, that they first exposed the belly, being opened, to the sun, casting the bowels into the river (Nilus), *tantum inquinamentum corporis*: this being done, they filled up the belly, and the hollow of the breast with unguents and odours, as it is manifest by those which I have seen.

<sup>d</sup> These ribbands, by what I observed, were of linen, which was also the habit of the Egyptian priests. For Herodotus, lib. 2. writes, that it was prophane for the Egyptians either to be buried in woollen garments, or to use them in their temples: and Plutarch de Iside & Osiride expressly tells us, that the priests of Isis used linen vestments, and were shaved; Suetonius in Orthona, (lib. 7.) *sacra etiam Isidis sepi hinc religiosequae veste prepalam celebravit*. And therefore the goddess Isis is called in Ovid (a Amor. Elen. 2.) *Linigera*. *Nec tu Linigeram fieri quid possit ad Isim, Quisquis.*

Of these Ribbands I have seen some so strong and perfect, as if they had been newly made. With these they bound and swathed the dead body, beginning with the head, and ending with the feet: Over these again, they wound others so often upon one another, that there could not be much less than a thou- sand en upon one body.

\* These coffins are fashioned in the similitude of a man, or rather resembling one of those imbalanced bodies, which, as we described before, are bound with ribbands, and wrapped in a shroud of linen. For as in those there is the shape of a head, with a kind of painted vizard, or face fastened to it, but no appearance without of the arms and legs: so it is with these coffins; the top of them hath the shape of the head of a man, with a face painted on it resembling a woman, the residue being one continued trunk: at the end of this trunk is a pedestal, somewhat broad; upon which it stood upright in the reconditory, as Herodotus here mentions. Some of these coffins are handsomely painted without, with several hieroglyphicks. Opening two of them, I found within, over the body, divers scroles fastened to the linen shroud. These were painted with sacred characters, for the colours very lively, and fresh; amongst which, were in a larger size the pictures of men or women, some headed like hawks, some like dogs, and sometimes dogs in thurs standing alone. These scroles either ran down the belly and sides, or else were placed upon the knees and legs. On the feet was a linen cover, (and so were all the scroles before-mentioned of linen,) painted with hieroglyphicks, and fashioned like to a high slipper. The breast had a kind of breast-plate covering it, made with folds of linen cut colop- wise, richly painted and gilt. In the midst of the bend at the top of it, was the face of a woman with her arms expanded; on each side of them, at the two outmost ends, the head of an hawk fairly gilt, by which they represented the Divine Nature, according to Plutarch (in his book de Iside & Osiride,) as by a serpent with the tail in his mouth, the revolution of the year was resembled; in which kind also I have seen fair sculptures in gems, found at Alexandria: and as by the sign of the cross they did denote *vitam æternam*, in Rufinus's expression. Of these crosses I have seen several amongst their hieroglyphicks; some painted, and some engraven in this manner ✕, and some others amongst their mummies formed of stone (or baked earth) in this figure.

At Rome, on the statue of Osiris, it is engraven thus: T. which may serve for confirmation of what Strabo and Suetonius relate; that at Alexandria, the temple of Serapis or Osiris (for Plutarch judges Serapis and Osiris to be one and the same,) being by the command of Theodosius demolished, they found characters resembling crosses cut in stone: these, in the interpretation of the wise men of Egypt, signified, *Tempus æternitatis, vitam æternam*: which discovery, as the same authors report, occasioned the conversion to Christianity of some of the Gentiles. *Socr. hist. eccl. lib. 5. cap. 17. Suetonius. hist. eccl. lib. 7. cap. 15.*

† *Ἰσίδης ὁ θεὸς τοῦ νεκροῦ, ἀνέπαυτος ὑπάρχων.* Plut. de Is. & Osir.

the

believe Tacitus, "the Hebrews (in general) learned from the Egyptians rather to bury their dead than to burn them. Where Spondanus instead of *condere cadavera*, reads *condire*, as if it had been their custom of powdering or embalming their dead. Wash them and anoint them we know they did, by what was done to our Saviour and to the widow Doreas; and long before it was in use amongst the Gentiles, as well as Jews, as appears by the funeral of Patroclus in Homer, and of Misenus the Trojan in Virgil.

*Corpusque lavant frigentis, & ungunt.*

And of Tarquinius the Roman in Ennius:  
*Tarquini corpus bona semina lavit, & unxit.*

But certainly the Egyptian manner of embalming, which we have described out of Herodotus and Diodorus, was not received by them; or if it were, *Martha* the sister of *Lazarus*, needed not to have fear'd, that after four days the body should have stunk. "They which infer out of the funeral of *Asa*, king of *Judah*, that it was the custom of the *Jews* as well as *Egyptians*, have very little probability for their assertion. "We read, that they buried him in his own sepulchre, which he had made for himself in the city of *David*, and laid him in the bed, which was filled with sweet odours, and divers kinds of spices prepared by the apothecaries art; and they made a very great burning for him. This very great burning is so contrary to the practice of the *Egyptians*, to whom it was an abomination, as appears by the authorities before cited of *Herodotus* and *Mela*, besides the little affinity of filling the bed with sweet odours, and the *Egyptians* filling the body and the place of the entrails with sweet odours, according both to *Herodotus* and *Diodorus*, that we shall not need to enlarge our selves in any other confutation. But as for that of *Jacob* and *Joseph*, the father and the son both living and dying in *Egypt*, the text is clear, they were embalmed after the fashion of the *Egyptians*. "And *Joseph* commanded his servants the physicians to imbalm his father, and the physicians embalmed *Israel*, and forty days were fulfilled for him (for so are fulfilled the days of those which are

embalmed) and the *Egyptians* mourned for him threescore and ten days. In the same chapter we read, "So *Joseph* died being an hundred and ten years old, and they imbalm'd him, and he was put in a coffin in *Egypt*. Both which places are very consonant to the traditions of *Herodotus* and *Diodorus*, and may serve to shew what necessity there is of having oft-times recourse to the learning of the heathen, for the illustration of the scriptures. Forty days were fulfilled for the embalming of *Jacob*: This "Diodorus tells us was their custom, They anointed the dead body with the juice of cedar, and other things for above thirty days, and afterward with myrrhe and cinnamon, and the like; which might make up the residue of the forty days: And the *Egyptians* mourned for him threescore and ten days. This time out of *Herodotus* may be collected to have been from the first day of the death of the person, till the body was returned by the physicians after seventy days perfectly embalmed. The text says, And *Joseph* was put in a coffin; which is very lively represented by "Herodotus. The kindred receiving the dead body from the embalmers, make a coffin of wood in the similitude of a man, in which they put it. This coffin then, as it is probable, of *Joseph*, was of wood, and not marmorea theca, as *Cajetan* imagines, the former being the custom of the *Egyptians*. Besides, that this was much easier and fitter to be carried by the *Israelites* into *Canaan*, marching on foot, and for ought we read destitute of waggons and other carriages.

The tradition of the ancient Hebrews in their commentaries, is very probable and consonant to it. They carried in the desert two arks, the one of God, the other of *Joseph*; that the ark of the covenant, this the ark (or coffin) in which they carried *Joseph's* bones out of *Egypt*. This coffin (if it be lawful for me to conjecture after the revolution of three thousand years,) I conceive to have been of sycamore, (a great tree very plentifully growing in *Egypt*), of which sort there are many found in the mummies, very fair, entire, and free from corruption to this day. Though I know the *Arabians* and *Persians* have a different tradition, that his coffin was of glass. "They put his blessed body, after they

to which the curious reader may have recourse.

**GRAVES** had washed it, into a coffin of glass, and buried it in the channel of the river Nilus, saith *Emir Cond*, a *Persian*.

That phrase of *Joseph*, where he takes an oath of the children of *Israel*, \* *Ye shall carry up my bones from hence, surely is a synecdoche, or figurative speech*. And so is that in *Exodus*: And *Moses* took the bones of *Joseph* with him; for he had straitly sworn the children of *Israel*, saying, *God will surely visit you, and ye shall carry up my bones away hence with you*: for his body being boweled, and then embalmed, after the manner of the *Ægyptians*, not only the bones, but the skin, the flesh, and all besides the entrails, (which according to *Plutarch*, were thrown into the river,) would have continued perfect and intire, a much longer space than from his death to their migration out of *Ægypt*.

Having thus by art found out ways to make the body durable, whereby the soul might continue with it, as we shewed before, which else would have been at liberty to have passed into some other body,<sup>d</sup> this also being the opinion of the *Ægyptians*, from whom *Pythagoras* borrowed his *μετεμύχουσις*, or transmigration, (the which made him to forbid his disciples the eating of flesh, *Ne forte bubulam quis de aliquo proavio suo obsonaret*, as *Terullian* wittily speaks;) the next care of the *Ægyptians* was to provide conditories, which might be as lasting as the body, and in which it might continue safe from the injury of time and men. That occasioned the ancient kings of *Thebes* in *Ægypt* to build those, which *Diodorus* thus describes: *There are, they say, the wonderful sepulchres of the ancient kings, which in magnificence exceeds the imitation of posterity*. Of these in the sacred commentaries, forty seven are mentioned; but in the time of *Ptolemæus Lagi*, there remained but xvii. Many of them at our being in *Ægypt*, in the hundred and eightieth olympiad, were decayed; neither are these things alone reported by the *Ægyptians*, out of the sacred books, but by many also of the *Græcians*, who in the time of *Ptolemæus Lagi* went to *Thebes*, and having compiled histories, (amongst whom is *Hecateus*;) agree with our relations. And this might occasion also those others recorded by *Strabo*, which he calls *τεμαλια*, or *mercuriales tumulos*, seen by him near *Siene*, in the upper parts of *Ægypt*, very

strange and memorable, *Passing in a chariot from Siene to Philæ, over a very even plain, about an hundred stadia, all the way almost, of both sides, we saw in many places mercurial tombs; a great stone, smooth, and almost spherical, of that black and hard marble out of which mortars are made, placed upon a greater stone, and on the top of this another, some of them lying by themselves; the greatest of them was no less than twelve feet diameter, all of them greater than the half of this*. Many ages after, when the regal throne was removed from *Thebes* to *Memphis*, the same religion and opinion continuing amongst the *Ægyptians*, that so long as the body indured, so long the soul continued with it, not as quickning and animating it, but as an attendant or guardian, and as it were unwilling to leave her former habitation. It is not to be doubted, this incited the kings there, together with their private ambition, and thirst after glory, to be at so vast expences in the building of these *Pyramids*; and the *Ægyptians* of lower quality, to spare for no cost, in cutting those *hypogææ*, those caves or dormitories in the *Libyan* deserts, which by the *Christians* now adays are called the *mummies*. *Diodorus Siculus* excellently expresses their opinion and belief in this particular, together with their extreme cost of building sepulchres, in these words: *The Ægyptians make small account of the time of this life being limited, but that which after death is joined with a glorious memory of virtue they highly value: They call the houses of the living, inns, because for a short space we inhabit these: But the sepulchres of the dead they name eternal mansions, because they continue with the gods for an infinite space. Wherefore in the structures of their houses they are little solicitous, but in exquisitely adorning their sepulchres they think no cost sufficient*.

Now why the *Ægyptians* did build their sepulchres often in the form of *Pyramids*, (for they were not always of this figure, as appears by those *τεμαλια*, or *mercuriales tumuli*, before cited out of *Strabo*, which were spherical; and by those *hypogææ*, or caves still extant in the rocks of the desert,) *Pierius* in his hieroglyphicks, or rather the *Anonymous Author* at the end of him, gives several philosophical reasons:

<sup>b</sup> *By a Pyramid, saith he, the ancient Ægyptians*

ἐν τῇ ταλάντῃ δι-  
κεῖν, &c.  
ἐν τῇ ταλάντῃ δι-  
κεῖν, &c.  
ἐν τῇ ταλάντῃ δι-  
κεῖν, &c.

tians expressed the nature of things, and that informed substance receiving all forms. Be-  
cause as a Pyramid having its beginning from  
a point at the top, is by degrees dilated on all  
its sides so the nature of all things proceeding  
from one fountain and beginning, which is  
indivisible, namely from God, the chief work-  
master; afterwards receives several forms, and  
is diffused into various kinds and species, all  
which it conjoins to that beginning and point,  
from whence every thing issues and flows.  
There may also be given another reason for  
this, taken from astronomy: For the Aegy-  
ptians were excellent astronomers, yea, the  
first inventors of it; these [dividing the Zo-  
diac, and all things under it, into twelve  
signs,] will have each sign to be a kind of  
Pyramid, the basis of which shall be in the  
heaven; (for the heaven is the foundation of  
astronomy,) and the point of it shall be in  
the centre of the earth; seeing therefore in  
these Pyramids all things are made, and  
that the coming of the sun, which is as it were  
a point in respect of the signs, is the cause  
of the production of natural things, and its  
departure the cause of their corruption, it  
seems very fitly that by a Pyramid, nature  
the parent of all things, may be expressed.  
Also the same Egyptians under the form of  
a Pyramid, shadowed out the soul of man,  
making under huge Pyramids the magnificent  
sepulchres of their kings and heroes, to testifie  
that the soul was still existent, notwithstanding  
the body were dissolved and corrupted, the which  
should generate and produce another body for  
it self, when it should seem good to the first  
agent, (that is, the circle of thirty six thou-  
sand years being transfused:) Like as a Py-  
ramid (as it is known to geometers,) the  
top of it standing fixed, and the base being  
moved about, describes a circle, and the whole  
body of it a cone; so that the circle expresses  
that space of years, and the cone that body  
which in that space is produced. For it was  
the opinion of the Egyptians, that in the re-  
volution of thirty six thousand years, all  
things should be restored to their former state,  
Plato witnesseth, that he received it from  
them, who seems also to me in his *Timæus*,  
to attest this thing, that is, that our soul hath  
the form of a Pyramid, which (soul) accord-  
ing to the same Plato, is of a fiery nature,  
and adhereth to the body as a Pyramid doth

to the basis, or as fire doth to the fuel. Thus  
far the Anonymous Author in *Pierius*: Most  
of which reasons of his are but pretty fancies,  
without any solid proof from good authors.  
For he might as well say, that the Aegy-  
ptians were excellent geometers, as well  
as astronomers, (as they were very skillful  
in both,) and that they made these Pyra-  
mids, to express the first and most simple  
of mathematical bodies; or else being ex-  
cellent arithmeticians, to represent the my-  
steries of pyramidal numbers; or being  
well seen in opticks, to shadow out the  
manner of vision, and the emission of  
rays from luminous bodies, as also the  
effluvia of the species intentionales from  
the object, all which are supposed to be  
pyramidal. But this were to play with  
truth, and to indulge too much to fancy.  
Wherefore I conceive the reason why they  
made these sepulchres in the figure of a  
Pyramid, was, either as apprehending this  
to be the most permanent form of struc-  
ture, as in truth it is; (for by reason of  
the contracting and lessening of it at the  
top, it is neither overpressed with its own  
weight; nor his so subject to the sinking  
in of rain as other buildings;) or hereby  
they intended to represent some of their  
gods. For anciently the Gentiles expres-  
sed them, either by columns fashioned like  
cones, or else by quadrilateral obelisks,  
the Egyptian manner; in which latter kind,  
I have seen many standing very intire, some  
of them plain, and some with hierogly-  
phicks inscribed. Now such obelisks are  
but lesser models of the Pyramids, as the  
Pyramids are but greater kinds of obe-  
lisks. The first institution of them, as  
<sup>1</sup> Pliny informs us, was by *Mitres* an A-  
egyptian king, whom <sup>2</sup> *Isidore* terms *Mes-  
phres*; both of them affirming him to have  
consecrated them *solis numini*, to the deity  
of the sun. Which deity <sup>3</sup> *Diodorus* relates  
the Egyptians to have worshipped under  
the name of *Osiris*, as they did the moon  
by the goddess *Isis*, whom the *Libyans* bor-  
dering on the Egyptians, termed *Urania*,  
and the *Phœnicians* *Astroarches*, according  
to <sup>4</sup> *Herodian*: (And therefore as *Isis Cor-  
nigera*, in which portraiture I have ob-  
served her statue at *Alexandria* to be form-  
ed,) did represent the horns of the moon,

tigio incipiens, paulatim in omnes partes dilatatur, sic rerum omnium natura ab unico principio & fonte, qui di-  
vidi non potest, nempe à Deo summo opifice profecta, varias deinde formas suscipit, & in varia genera atque  
species diffunditur, omniaque apici illi & puncto conjungit, à quo omnia manant & fluunt. Verum & alia bu-  
jus rei ratio nempe astronomia reddi potest, &c.

<sup>1</sup> Traces ex eo fecere reges quodam certamine, obeliscos vocantes solis numini sacratos. Radiorum ejus argu-  
mentum in effigie est: & ita significabatur nomine Egyptio. Primus omnium id instituit Mitres, qui in solis  
urbe regnabat, somnio jussus. Plin. lib. 36. cap. 8.

<sup>2</sup> Obeliscum Mesphres rex Egypti primus fecisse fertur — qui post cæcitatem visio recepto, duos obeliscos  
solis consecravit. Ibid. lib. 18. cap. 31.

<sup>3</sup> Ταλασίη υἱὸς τοῦ Θιου αἰδίου καὶ πρώτου, τῆς ἡλίου καὶ τῆς σελήνης, ὃς τὸν Ὀσίριον τῶν ἱσίων ἐπορεύετο.  
Diod. Sic. lib. 1.

<sup>4</sup> Αἰδίου δὲ αὐτὸς Οὐρανίαν καλεῖται, Φοίνικες δὲ Ἀστροάρχον φερούσιν, σελήνην υἱὸν αἰδίου, Herodian. lib. 5.

**G**RAVES or luna *falcata*; so these quadrilateral Pyramids, or obelisks, might not unfitly resemble the rays of the sun, or their god *Osiris*: A god denominated, as *Plutarch* testifies, from *Os*, signifying in the *Egyptian* language, many, and *Iri* eyes. For which reason, both *Diodorus* and *Plutarch*, term *Osiris* in Greek *πολύφθαλμος*, many eyes, or many rays; the which emitted, as the optics demonstrate, in pyramidal or conical forms, might not unaptly by the Gentiles be represented in either figure. Hence the *Phœnicians*, next neighbours to the *Egyptians*, and probably first imitators of this their idolatry, worshipped the sun, whom they named *Elæagabalus*, or as the ancient coins render him, *Alegabalus*, and some inscriptions *Heliogabalus*, an idol, in the similitude of a cone. *Herodian* (l. 5.) *The Phœnicians worship the sun, calling him in their language Elæagabalus; to whom there is erected a very spacious temple, adorned with gold, plenty of silver, and precious stones. It is not only worshipped by the natives, but likewise the great men, and kings of the Barbarians every year, with a kind of emulation, send honourable presents to the god. There is no statue, as among the Greeks and Romans, which polished by hand, may express the image of the god. But there is a certain great stone circular below, and ending with a sharpness above, in the figure of a cone, of black colour. They report it to have fallen from heaven, and to be the image of the sun.* This idolatry by commerce with the *Egyptians* and *Phœnicians*, came afterward to be communicated to the *Grecians*, and other nations; and from these, what at the first institution was proper to the sun, came by superstition to be apply'd to their other gods. Thus *Tacitus* (lib. II. hist.) at *Cyprus* in the temple of *Venus*, at *Paphos*, *The image of the goddess is not of human shape, but a figure rising continually round, from a larger bottom to a small top in conical fashion; the reason thereof is not known. Though what Tacitus rendreth meta modo exurgens,*

or conical, *Maximus Tyrus* termeth pyramidal. *In Paphos, Venus hath the chiefest honour; bowbeit, her image you can liken to nothing so well as to a white Pyramid.* In like manner we find in *Clemens Alexandrinus*, that *Calisto* the priestess of *Juno*, decked the column of the goddess with crowns and garlands; that is, faith *Joseph Scaliger*, the image of the goddess with crowns and garlands; for at that time the statues of the gods were *κίονες πυραμιδοειδής*, pyramidal columns, or obelisks. And *Ἀπόλλων αἰώνος*, was nothing else with the *Grecians* but *κίονας εἰς τὸν λόγον*, a column ending in a point, as *Suidas* witnesseth: which kind of columns some make proper to *Apollo*, others to *Bacchus*, and others to them both. In *Pausanias* also we read, that in the city *Corinth*, *Jupiter*, *Melichius*, and *Diana* surnamed *Patroa*, were made with little or no art: *Melichius* being represented by a Pyramid, and *Diana* by a column. Whence not improbably the same *Pausanias*, in his *Corinthiacs*, conjectures, this manner of representation of the gods, to have been the first and most ancient among the *Grecians*. But *Clemens Alexandrinus*, deriving the beginning of it much higher, imagines it to have been the first kind of idolatry in the world, (and therefore well agreeing with the antiquity of the *Egyptians*;) *Before the exact art of making statues was found out, the ancients erecting columns, [pyramidal or conical columns,] worshipped these as the images of God.*

This practice of the *Egyptians*, I mean of erecting Pyramids for sepulchres, was but rarely imitated by other nations; tho' *Servius* seems to make it frequent in his comment upon these verses of *Virgil*:

—Fuit ingens monte sub alto  
Regis Dercenni, terreno exaggere bustum  
Antiqui Laurentis, opacaque ilice testum.

*With the ancients (saith Servius) noble men were buried, either under mountains, or*

<sup>11</sup> Apud majores, nobiles aut sub montibus, aut in montibus sepeliebantur: unde natus est, ut supra calaverat, aut Pyramides fierent, aut ingentes collocarentur columnæ. Serv. in Virgil.

in mountains; whence the custom came, that over the dead, either Pyramids were made or huge columns erected. In imitation of the latter custom, it may be \* Absalom erected his pillar; and Pausanias describing the manner of burial amongst the ancient nation of the Sicyonians, tells us, <sup>b</sup> that they covered the body with earth, and raised pillars over it. But for the former of the Pyramids, I find none out of Egypt accounted miraculous, unless it be the sepulchre of Porfena king of Etruria, (with which I shall conclude, described by Pliny out of Varro; being more to be admired

for the number and contrivance of the Pyramids, than for any excessive magnitude. <sup>c</sup> We shall use M. Varro's own words in the description of it.

He was buried, saith he, without the city Clusium, in which place he left a monument of square stone. Each side of it is three hundred feet broad, and fifty feet high. Within the square basis there is an inextricable labyrinth, whither whose adventures without a clue can find no passage out. Upon this square there stand five Pyramids, four in the angles, and one in the middle; in the bottom they are broad seventy five feet, and high an hundred and fifty. They are pointed in such a manner, that at the top there is one brass circle, and covering for them all, from which there hangs bells fastened to chains: These being moved by the wind, give a sound afar off, as at Dodona it has formerly been. Upon this circle there are four other Pyramids, each of them an hundred feet high. Above which, upon one plain, there are five Pyramids, the altitude of which Varro was ashamed to add. The Etruscan fables report that it was as much as that of the whole work. With so vain a madness he sought glory by an expence useful to no man; wasting besides the wealth of his kingdom, that in the end the commendation of the artificer should be the greatest.

*Porfena's Tomb at Clusium  
in Italy Consisting of many Pyramids*

\* 2 Sam. xviii. 18.

<sup>b</sup> Pausanias Corinth. five lib. 2. Αἰὲρ δὲ Σικωνίῃ τὰ πολλὰ τοιαῦτα γένηται.

<sup>c</sup> Plin. l. 36. c. 13. Utemur ipsius M. Varroni in expositione ejus verbis. Sepultus est, inquit, sub urbe Clusio, in quo loco monumentum reliquit lapide quadrato, singula latera pedum lata tricenarium, alta quinquagenarium: inque basi quadrata intus labyrinthum inextricabilem: quo si quis impropere sine glomere fini, exitum invenire nequeat. Supra id quadratum Pyramides sunt quinque, quatuor in angulis, & in medio una; in imo latera pedum septuagenarium quinum, alias centum quinquagenum: ita fastigiata, ut in summo orbis aenei, & petasus unus omnibus sit impositus, ex quo pendeant excepta catenis tintinnabula, quae vento agitata longi sonitus referant, ut Dodona olim factum. Supra quem orbem quatuor Pyramides insuper singula extant alias pedum centenium. Supra quas uno solo quinque Pyramides, quarum altitudinem Varro neminem puduit adicere. Fabulae Etruscae tradunt eandem fuisse quam totius operis: addo vestigia dementiae quaeque gloriam, impendio nulli profutura. Praeterea saepe regni vires, ut tamen laus major artificio esset. Plin. l. 36. c. 13.

*A Description of the PYRAMIDS in ÆGYPT, as I found them in the CIO XL VIII Year of the Hegira, or in the Years CIO ID CXXXVIII, and CIO ID CXXXIX of our LORD, after the Dionysian Account.*

**G**RAVES **H**AVING discovered the founders of these Pyramids, and the time in which they were erected, and lastly, the end for which these monuments were built: next, in the method we proposed, the *sciography* of them is to be set down: where, we shall begin with the dimensions of their figure without, and then we shall examine their several spaces and partitions within.

*A Description of the first and fairest PYRAMID.*

*The outside of the first Pyramid*

**T**HE first and fairest of the three greater Pyramids, is situated on the top of a rocky hill in the sandy desert of *Libya*, about a quarter of a mile distant to the west, from the plains of *Ægypt*: above which the rock riseth an hundred feet or better, with a gentle and easy ascent. Upon this advantageous rise, and upon this solid foundation the Pyramid is erected; the height of the situation adding to the beauty of the work, and the solidity of the rock giving the superstructure a permanent and stable support. Each side of the Pyramid, computing it according to *Herodotus*, contains in length 10 ecc *Grecian* feet; and in *Diodorus Siculus's* ac-

us Siculus's ac-

in the 2nd

count

count 10 cc: <sup>1</sup>Strabo reckons it less than a furlong, that is, less than 100 Grecian feet, or six hundred twenty five Roman; and <sup>2</sup>Pliny equals it to 10 ccc LXXXIII. That of <sup>3</sup>Diodorus Siculus in my judgment comes nearest to the truth<sup>h</sup>, and may serve in some kind to confirm those proportions, which in another discourse I have assigned to the Grecian measures. For measuring the north-side of it, at the *basis*, by an exquisite *radius* of ten feet in length, taking two several stations, as mathematicians use to do, when any obstacle hinders their approach, I found it to be six hundred ninety three feet, according to the *English* standard; which quantity is somewhat less than that of <sup>4</sup>Diodorus. The rest of the sides were examined by a line, for want of an even level, and a convenient distance to place my instruments, both which the *area* on the former side afforded.

The altitude of this pyramid was long since measured by <sup>5</sup>Thales Milesius, who, according to <sup>6</sup>Tatianus Affrius, lived about the fiftieth olympiad: but his observation is no where by the antients expressed. Only <sup>7</sup>Pliny tells us of a course proposed by him, how it might be found, and that is by observing such an hour, when the shadow of the body is equal to its height: A way at the best, by reason of the faintness, and scattering of the extremity of the shadow, in so great an altitude, uncertain and subject to error. And yet <sup>8</sup>Diogenes Laertius in the life of <sup>9</sup>Thales, hath the same story from the authority of <sup>10</sup>Hieronymus. Hieronymus reports, that he measured the Pyramids by their shadow, marking when they are of an equal quantity. Wherefore I shall pass by his, and give my own observations. The altitude is something defective of the latitude; though in <sup>11</sup>Strabo's computation it exceeds; but <sup>12</sup>Diodorus rightly acknowledges it to be less; which, if we measure by its perpendicular, is four hundred ninety nine feet; but if we take it as the Pyramid ascends inclining (as all such figures do,) then is it equal, in respect of the lines subtending the several angles, to the latitude of the

*basis*, that is, to six hundred ninety three <sup>GRÆVUS</sup> feet. With reference to this great altitude <sup>13</sup>Statius calls them,

— audacia saxa  
Pyramidum —

And <sup>14</sup>Tacitus, *Inftar montium eductæ Pyramides.*

<sup>15</sup>Julius Solinus goes farther yet: *The Pyramids are sharp pointed towers in Ægypt, exceeding all height which may be made by hand.* <sup>16</sup>Ammianus Marcellinus in his expression ascends as high: *The Pyramids are towers erected altogether, exceeding the height which may be made by man; in the bottom they are broadest, ending in sharp points at top; which figure is therefore by geometricians called pyramidal, because in the similitude of fire it is sharpened into a cone, as we speak.* <sup>17</sup>Propertius with the liberty of a poet, in an hyperbole, flies higher yet:

*P'ysidum sumptus ad sidera ducit.*

And the Greek Epigrammatist in a transcendent expression, is no way short of him.

*Ἡ γὰρ οὐδὲν ἔστιν ἄνω Νεφελίδος ἄσπερον μέτρον.  
Κυβερνᾷ Χρυσεὶς ἄσπερος πλάδαυ.*

What excessive heights they fancied to themselves, or borrowed from the relations of others, I shall not now examine: This I am certain of, that the shaft or spire of *Paul's* in *London*, before it was casually burnt, being as much, or somewhat more than the altitude of the tower now standing, did exceed the height of this Pyramid. For <sup>18</sup>Camden describes it in his *Elizabetha*, to be in a perpendicular five hundred and twenty feet from the ground: And in his <sup>19</sup>*Britannia*, to have been somewhat more, 10 xxxiv feet; whereof the tower cclx, and the Pyramid on the top cclxxiv. See *Godw. de presul.* 229.

If we imagine upon the sides of the *basis*, which is perfectly square, four equila-

**G**RAVES teral triangles mutually inclining, till they all meet on high as it were in a point, (for so the top seems to them which stand below,) then shall we have a true notion, of the just dimension and figure of this Pyramid; the perimeter of each triangle comprehending two thousand seventy nine feet, (besides the latitude of a little plain or flat on the top,) and the perimeter of the basis two thousand seven hundred seventy two feet. Whereby the whole area of the basis (to proportion it to our measures,) contains four hundred eighty thousand two hundred forty nine square feet, or eleven English acres of ground, and 1089 of 43560 parts of an acre. A proportion so monstrous, that if the ancients did not attest as much, and some of them describe it to be more, this age would hardly be induced to give credit to it. But *Herodotus* describing each side to contain eight hundred feet, the area mult of necessity be greater than that by me assigned, the sum amounting to six hundred and forty thousand; or computing it as *Diodorus Siculus* doth, the area will comprehend four hundred and ninety thousand feet: And in the calculation of *Pliny*, if we shall square eight hundred eighty three, (which is the number allotted by him to the measure of each side,) the product seven hundred seventy nine thousand six hundred eighty nine, will much exceed both that of *Herodotus* and this of *Diodorus*. Tho' certainly, *Pliny* is much mistaken in assigning the measure of the side to be eight hundred eighty three feet, and the basis of the Pyramid to be but eight jugera, or Roman acres. For if we take the Roman jugerum to contain in length two hundred and forty feet, and in breadth one hundred and twenty, as may be evidently proved out of *Varro*, and is expressly affirmed by *Quintilian*, then will the superficies or whole extension of the jugerum be equal to twenty eight thousand eight hundred Roman feet; with which, if we divide seven hundred seventy nine thousand six hundred eighty nine, the result will be twenty seven Roman jugera, and 2089 of 28800 parts of an acre. Wherefore, if we take those numbers eight hundred eighty three of *Pliny* to be true, then I suppose he writ twenty eight jugera instead of eight, or else in his proportion of the side to the area of the basis, he hath err'd.

The ascent to the top of the Pyramid is contrived in this manner: from all the sides without we ascend by degrees; the lowest degree is near four feet in height, and three in breadth; this runs about the Pyramid in a level; and at the first, when the stones were intire, which are now somewhat decayed, made on every side of it a long but narrow walk. The second degree is like the first, each stone amounting to almost four feet in height, and three in breadth; it retires inward from the first near three feet, and thus runs about the Pyramid in a level, as the former. In the same manner is the third row placed upon the second, and so in order the rest, like so many stairs rising one above another to the top. Which ends not in a point, as mathematical Pyramids do, but in a little flat or square. Of this, *Herodotus* hath no where left us the dimensions: But *Henricus Stephanus*, an able and deserving man, in his comment hath supplied it for him. For he makes it to be eight orgia. Where if we take the orgia as both *Hesychius* and *Suidas* do, for the distance between the hands extended at length, that is, for the fathom or six feet, then should it be forty eight feet in breadth at the top. But the truth is, *Stephanus* in this particular, whilst he corrects the errors of *Valla's* interpretation, is to be corrected himself. For that latitude which *Herodotus* assigns to the admirable bridge below, (of which there is nothing now remaining,) he hath carried up, by a mistake to the top of the Pyramid. *Diodorus Siculus* comes nearer to the truth, who describes it to be but nine feet. *Pliny* makes the breadth at the top to be twenty five feet. *Altitudo* (I would rather read it *latitudo*), à cacumine pedes XXV. By my measure it is XIII feet, and 280 of 1000 parts of the English foot. Upon this flat, if we assent to the opinion of *Proclus*, it may be supposed that the Egyptian priests made their observations in astronomy; and that from hence, or near this place, they first discovered, by the rising of *Sirius*, their annus *novis*, or *canicularis*, as also their *periodus Solbiaca*, or *annus magnus novis*, or *annus Heliacus*, or *annus Dei*, as it is termed by *Censorinus*, consisting of 1460 sidereal years; in which space their *both vagum*, and *fixum*, came to have the same beginning: That the priests might near these Pyramids, make their observati-

ons I no way question; this rising of the hill being, in my judgment, as fit a place as any in *Egypt* for such a design; and so much the fitter by the vicinity of *Memphis*. But that these Pyramids were designed for observatories, (whereas by the testimonies of the ancients I have proved before, that they were intended for sepulchres,) is no way to be credited upon the single authority of *Proclus*. Neither can I apprehend to what purpose the priests with so much difficulty should ascend so high, when below with more ease, and as much certainty, they might from their own lodgings hewn in the rocks, upon which the Pyramids are erected, make the same observations. For seeing all *Egypt* is but as it were one continued plain, they might from these cliffs have, over the plains of *Egypt*, as free and open a prospect of the heavens, as from the tops of the Pyramids themselves. And therefore *Tully* writes more truly: *Ægyptii, aut Babylonii, in camporum patentium aquaribus habitantes, cum ex terrâ nihil emeretur, quod contemplationi celi officere possit, omnem curam in siderum cognitione posuerunt.* The top of this Pyramid is covered not with <sup>b</sup> one or <sup>c</sup> three massy stones, as some have imagined, but with nine, besides two which are wanting at the angles: The degrees by which we ascend up, (as I observed in measuring many of them,) are not all of an equal

depth, for some are near four feet, others want of three, and these the higher we ascend, do so much the more diminish: Neither is the breadth of them alike; the difference in this kind, being as far as I could conjecture, proportionable to their depth. And therefore a right line extended from any part of the basis without to the top, will equally touch the outward angle of every degree. Of these it was impossible for me to take an exact measure, since in such a revolution of time, if the inner parts of the Pyramid have not lost any thing of their first perfection, as being not exposed to the injury of the <sup>a</sup> air and fall of rains; yet the outward parts, that is, these degrees or rows of stone, have been much wasted and impaired by both. And therefore they cannot conveniently now be ascended, but either at the south-side, or at the east-angle, on the north: They are well stiled by *Herodotus*, *Βασιλίδες*, that is, little altars: For in the form of altars they rise one above another to the top. And these are all made of massy and polished stones, hewn according to *Herodotus*, and *Diodorus*, out of the Arabian mountains, which bound the upper part of *Egypt*, or that above the *delta* on the east, as the *Lybian* mountains terminate it on the west, being so vast, that the breadth and depth of every step, is one single and entire stone. <sup>c</sup> Sand's travels.

<sup>d</sup> The air of *Egypt* is confessed by the antients to be often full of vapours. Which appears both by the great dews, that happen after the deluge of *Nilus* for several months; as also in that I have discovered at *Alexandria*, in the winter time, several obscure stars in the constellation of *Ursa major*, not visible in *England*; the which could not be discerned, were there not a greater refraction at that place than with us, and consequently a greater condensation of the medium, or air, as the optics demonstrate. But I cannot sufficiently wonder at the antients, who generally deny the fall of rain in *Egypt*. *Plato*, in his *Timæus*, speaking of *Egypt*, where he had lived many years, writes thus: *Καὶ δὲ τὸ πλεονεχὲς τῆς γῆς αὐτῆς ἀλλοτρίον, ἀπὸ τοῦ ἐν τῇ αἰσθητικῇ φύσει ἐκείνῃ. Πομπηίου Μέλῃ in express terms relates, that *Egypt* is terra ex parte imbricaria, mirè tamen fertilis. Whereas for two months, namely *December* and *January*, I have not known it rain so constantly and with so much violence at *London*, as I found it do at *Alexandria*, the winds continuing north north-west; which caused me to keep a diary as well of the weather, as I did of my observations in astronomy: And not only there, but also at *Grand Cairo*, my very noble and worthy friend, sir *William Paston*, at the same time, observed, that there fell much rain. And so likewise about the end of *March* following, being at the *mumies*, somewhat beyond the Pyramids, to the south, there fell a gentle rain for almost a whole day: But it may be the antients mean the upper parts of *Egypt* beyond *Thebes*, about *Siena*, and near the *Catadupa*, or cataracts of *Nilus*, and not the lower parts; where I have been told by the *Ægyptians*, that it seldom rains. And therefore *Seneca* (lib. 4. *Natur. Quæst.*) seems to have writ true, *In ea parte quæ in Æthiopia vergit* (speaking of *Egypt*) *aut nulli imbres sunt, aut rari.* But where he after says, *Alexandria nives non cadunt*, it is false: For at my being there in *January*, at night it snowed. However, farther to the south than *Egypt*, between the tropicks, and near the line, in *Habassina*, or *Ethiopia* every year, for many weeks, there falls store of rain, as the *Habassines* themselves at *Grand Cairo* relate. Which may be confirmed by *Josèphus* *Æthi. lib. 2. de naturâ orbis novi*, where he observes in *Peru*, and some other places (lying in the same parallel with those of *Ethiopia*) that they have abundance of rains. This then is the true cause of the inundation of *Nilus* in the summer time, being then highest, when other rivers are lowest; and not those which are alleged by *Herodotus*, *Diodorus*, *Plutarch*, *Aristides*, *Heliodorus*, and others: Who are extremely troubled to give a reason of the inundation, imputing it either to the peculiar nature of the river, or to the obstruction of the mouth of it by the *Etesia*; or to the melting of snows in *Ethiopia*, (which I believe seldom fall in those hot countries, where the natives, by reason of the extreme heats, are all black; and where, if we credit *Seneca*, *argentum replumbatur, flos is melted*, by the scorching heats) or to some such other reasons of little weight. In *Diodorus* I find *Agatharchides* *Cnidius*, to give almost the same reason assigned by me: But those times gave little credit to his assertion. Yet *Diodorus* seems to assent to it, (*Did. lib. 1.*) *Agatharchides Cnidius habet come narisi to the truth; for he saith: Every year in the mountains about Ethiopia, there are continual rains from the summer solstice, to the autumnal equinox, which cause the inundation.* The time of this is accounted generally for certain, that I have seen the *Ægyptian* astronomers to put it down many years before, in their Ephemerides: That such a day of such a month, the *Nilus* begins to rise.*

**GREATER** and <sup>1</sup> *Pomponius Mela*, is more admirable, who make the least stone in this Pyramid to be thirty feet. And this I can grant in some, yet surely it cannot be admitted in all, unless we interpret their words, that the least stone is thirty square, or to speak more properly, thirty cubical feet; which dimension, or a much greater, in the exterior ones, I can without any difficulty admit. The number of these steps is not mentioned by the ancients, and that caused me, and two that were with me, to be the more diligent in computing them, because by modern writers, and some of those too of repute, they are described with much diversity and contrariety. The degrees, saith <sup>2</sup> *Bellonius*, are about two hundred and fifty, each of them single contains in height forty five digits, at the top it is two paces broad. For this I take to be the meaning of what *Clusius* renders thus: *A basi autem ad cacumen ipsius supputationem facientes, comperimus circiter ccl. gradus, singuli altitudinem habent v. solarum calcei ix. pollicum longitudines, in fastigio duos passus habet.* Where I conceive his *passus* is in the same sense to be understood here above, as not long before he explains himself in describing the *basis* below, which in his account is cccxxiv *passus* paululum extensis cruribus. <sup>3</sup> *Albertus Lewenstainius* reckons the steps to be two hundred and sixty, each of them a foot and a half in depth. *Jobannes Helfricus* counts them to be two hundred and thirty. <sup>4</sup> *Sebastius Serlius*, upon a relation of *Grimano*, the patriarch of Aquileia, and afterwards cardinal, (who in his travels in *Egypt* measured these degrees) computes them to be two hundred and ten; and the height of every step to be equally three palms and an half. It would be but lost labour, to mention the different and repugnant relations of several others: That which by experience, and by a diligent calculation, I, and two others found, is this, that the number of degrees from the bottom to the top, is two hundred and seven; tho' one of them in descending reckoned two hundred and eight.

Such as please, may give credit to those fabulous traditions of <sup>5</sup> some, that a *Turkish*

archer standing at the top, cannot shoot beyond the bottom, but that the arrow will necessarily fall upon these steps. If the *Turkish* bow (which by those figures that I have seen in ancient monuments, is the same with that of the *Partians*, so dreadful to the *Romans*) be but as swift, and strong, as the *English*; as surely it is much more, if we consider with what incredible force some of them will pierce a plank of six inches in thickness, (I speak what I have seen) it will not seem strange, that they should carry twelve score in length; which distance is beyond the *basis* of this Pyramid.

The same credit is to be given to those reports of the ancients, that this Pyramid, and the rest, cast no shadows. <sup>6</sup> *Solinus* writes expressly, *Mensuram umbrarum egressæ nullas habent umbras.* And <sup>7</sup> *Ausonius*:

—Quadro cui in fastigia cono  
Surgit & ipsa suas consumit Pyramis umbras.

<sup>8</sup> *Ammianus Marcellinus* hath almost the same relation, *umbras quoque mechanicâ ratione consumit.* Lastly, <sup>9</sup> *Cassiodorus* confirms the same, *Pyramides in Ægypto, quarum in suo statu se umbra consumens, ultra constructionis spatia nulla parte respicitur.* All which in the winter season I can in no sort admit to be true: For at that time I have seen them cast a shadow at noon. And if I had not seen it, yet reason, and the art of measuring altitudes by shadows, and on the contrary, of knowing the length of shadows by altitudes, doth necessarily infer as much. Besides how could *Tales Milesius*, above two thousand years since, have taken their height by shadows, according to *Pliny*, and *Laertius*, as we mentioned before, if so be these Pyramids have no shadows at all? To reconcile the difference, we may imagine, *Solinus*, *Ausonius*, *Marcellinus*, and *Cassiodorus*, mean in the summer-time; or which is nearer the truth, that almost for three quarters of the year, they have no shadows: And this I grant to be true at midnight.

A Description of the Inside of the first PYRAMID.

The inside of the first and fairest Pyramid

If you imagine the whole Pyramid to be divided in the midst of a plane extended from the North side to the South: the entrance Galleries, and Chambers, with the several passages to them, will appear in this manner

AB the entrance into the Pyramid  
BC the ascent into the First Gallery  
CE the first Gallery  
DE the Well  
GH the passage in the arched Chamber  
HI the arched Chamber  
FK the second Gallery  
KN the first anticloset  
NO the second anticloset  
OP the Chamber in which the tombe stands

HAVING finished the description of the greater Pyramid, with the figure, and dimensions of it, as they present themselves to the view without: I shall now look inwards, and lead the reader into several spaces, and partitions within: of which, if the ancients have been silent, we must chiefly impute it to a reverend and awful regard, mixed with superstition, in not presuming to enter those chambers of death, which religion, and devotion, had consecrated to the rest, and quiet of the dead. Wherefore <sup>a</sup>Herodotus mentions no more, but only in general, that some secret vaults are hewn in the rock under the Pyramid. Diodorus Siculus is silent; though both enlarge themselves in other particulars less necessary. <sup>b</sup>Strabo also is very concise, whose whole description both of this, and of the second Pyramid, is included in this short expression: Forty stadia from the city (Memphis), there is a certain brow of an hill, in which are many Pyramids, the sepulchres of kings: Three of them are memorable. Two of these are accounted amongst the seven mi-

racles of the world; each of these are a furlong in height: The figure is quadrilateral, the altitude somewhat exceeds each side, and the one is somewhat bigger than the other. On high, as it were, in the midst between the sides, there is a stone that may be removed, which being taken out, there is an oblique (or shelving) entrance (for so I render that which by him is termed *σύνεξε σκαλία*) leading to the tomb. <sup>c</sup>Pliny expresses nothing within, but only a well (which is still extant) of eighty six cubits in depth; in which he probably imagines, by some secret aqueduct, the water of the river Nilus to be brought. Aristides, in his oration, entitled, *Ἀγώνισμα*, upon a misinformation of the Egyptian priests, makes the foundation of the structure to have descended as far below, as the altitude ascends above. Of which I see no necessity, seeing all of them are founded upon rocks. His words are these: <sup>d</sup>Now as with admiration we behold the tops of the Pyramids, but that which is as much more under ground opposite to them, we are ignorant of. (I speak what I have received from

**G**RAVES (the priests.) And this is that which hath been delivered to us by the ancients; which I was unwilling to pretermitt, more out of reverence of antiquity, than out of any special satisfaction. The Arabian writers, especially such as have purposely treated of the wonders of Egypt, have given us a more full description of what is within this Pyramid: But that hath been mixed with so many fictions of their own, that the truth hath been darkened, and almost quite extinguished by them. I shall put down that which is confessed by them, to be the most probable relation, as is reported by Ibn Abd Albokm, whose words out of the Arabick are these: The greatest part of chronologers agree, that he which built the Pyramids, was, Saurid Ibn Salhouk, king of Egypt, who lived three hundred years before the flood. The occasion of this was, because he saw in his sleep, that the whole earth was turned over with the inhabitants of it, the men lying upon their faces, and the stars falling down, and striking one another, with a terrible noise, and being troubled, he concealed it. After this he saw the fixed stars falling to the earth, in the similitude of white fowl, and they snatched up men, carrying them between two great mountains; and these mountains closed upon them, and the shining stars were made dark. Awaking with great fear, he assembled the chief priests of all the provinces of Egypt, an hundred and thirty priests, the chief of them was called Aclim: Relating the whole matter to them, they took the altitude of the stars, and making their prognostication, foretold of a deluge. The king said, Will it come to our country? They answered, Yea, and will destroy it. And there remained a certain number of years for to come, and he commanded in the mean space to build the Pyramids, and a vault to be made, into which the river Nilus entering, should run into the countries of the West, and into the land Al-Said; and he filled them with treasures, and with strange things, and with riches, and treasures, and the like. He engraved in them all things that were told him by wise men, as also all profound sciences, the names of alakakirs, the uses and hurts of them. The science of astrology, and of arithmetick, and of geometry, and of physick. All this may be interpreted

by him that knows their characters, and language. After he had given order for this building, they cut out vast columns and wonderful stones. They fetch massy stones from the Ethiopians, and made with these the foundation of the three Pyramids, fastning them together with lead and iron. They built the gates of them forty cubits under ground, and they made the height of the Pyramids one hundred royal cubits, which are fifty of ours in these times, he also made each side of them an hundred royal cubits. The beginning of this building was in a fortunate bore-scope. After that he had finished it, he covered it with coloured fatten, from the top to the bottom, and he appointed a solemn festival, at which were present all the inhabitants of his kingdom. Then he built in the western Pyramid thirty treasures, filled with store of riches, and utensils, and with signatures made of precious stones, and with instruments of iron, and vessels of earth, and with arms which rust not, and with glass which might be bended, and yet not broken, and with strange spells, and with several kinds of alakakirs, single and double, and with deadly poisons, and with other things besides. He made also in the east Pyramid, divers celestial spheres and stars, and what they severally operate, in their aspects, and the perfumes which are to be used to them, and the books which treat of these matters. He also put in the coloured Pyramid, the commentaries of the priests, in chests of black marble, and with every priest a book, in which were the wonders of his profession, and of his actions, and of his nature, and what was done in his time, and what is, and what shall be, from the beginning of time, to the end of it. He placed in every Pyramid a treasurer: The treasurer of the western Pyramid was a statue of marble-stone, standing upright with a lance, and upon his head a serpent wreathed. He that came near it, and stood still, the serpent bit him of one side, and wreathing round about his throat, and killing him, returned to his place. He made the treasurer of the east Pyramid, an idol of black agate, his eyes open and shining, sitting upon a throne with a lance; when any looked upon him, he heard of one side of him a voice, which took away his sense, so that he fell prostrate upon his face, and ceased not till he

\* *Telema*] The word used by the Arabians is derived from the Greek, *ὑπερμαρμα*, by an *apbæresis* of *ὑπερ*. By the like *apbæresis*, together with an *epenthesis*, the Arabians call him *Babtonassar*, whom Ptolemy names *Nabonassar*: as by an *apbæresis*, and *syncope*, the Turks call *Constantinople*, *Stambol*, or *Istanbul*: from whence some of our writers term it *Stambol*; tho' the Arabians more fully express it by *Constantiniya*, and *Buzantiya*; that is, *Constantinopolis*, and *Byzantium*. The various significations of *ὑπερμαρμα*, and *ὑπερμαρμα*, see in Mr. Seiden's learned discourse, *de diis Syris*; and in Scaliger's annotations, in *apotelesmatum Manili*. That which the Arabians commonly mean by *telema*, are certain *figilla*, or *amuleta*, made under such and such an aspect, or configuration of the stars and planets, with several characters accordingly inscribed.

† *Alakakir*] Amongst other significations, is the name of a precious stone; and therefore in *Abulfeda* it is joined with *yacut*, a *ruby*. I imagine it here to signify some magical spell, which it may be was engraven in this stone.

died. He made the treasurer of the coloured Pyramid a statue of stone, (called) Albut, sitting: he which looked towards it was drawn by the statue, till he stuck to it and could not be separated from it, till such time as he died. The Coptites write in their books, that there is an inscription engraven upon them, the exposition of which in Arabick is this: I king Saurid built the Pyramids in such and such a time, and finished them in six years: he that comes after me, and says that he is equal to me, let him destroy them in six hundred years; and yet it is known, that it is easier to pluck down, than to build up. I also covered them, when I had finished them, with fatten; and let him cover them with mats. After that, Almamon the calif entered Egypt, and saw the Pyramids: He desired to know what was within, and therefore would have them opened: They told him, It could not possibly be done: He replied, I will have it certainly done. And that hole was opened for him, which stands open to this day, with fire and vinegar. Two smiths prepared and sharpened the iron, and engines, which they forced in, and there was a great expence in the opening of it: The thickness of the wall was found to be twenty cubits; and when they came to the end of the wall, behind the place they had digged, there was an ewer (or pot) of green emerald; in it were a thousand dinars very weighty, every dinar was an ounce of our ounces: they wondered at it, but knew not the meaning of it. Then Almamon said, Cast up the account, how much bath been spent in making the entrance: they cast it up, and lo it was the same sum which they found, it neither exceeded, nor was defective. Within they found a square well, in the square of it there were doors, every door opened into an house (or vault) in which there were dead bodies wrapped up in linen. They found towards the top of the Pyramid, a chamber, in which there was an hollow stone: in it was a statue of stone like a man, and within it a man, upon whom was a breast-plate of gold, set with jewels, upon his breast was a sword of invaluable price, and at his head a carbuncle of the bigness of an egg, shining like the light of the day, and upon him were characters written with a pen, no man knows what they signify. After Almamon had opened it, men entered into it for many years, and descended by the slippery passage, which is in it, and some of them came out safe, and others died. Thus far the Arabians; which traditions of theirs, are little better than a romance; and therefore leaving these, I shall give a more true and particular description, out of mine own experience, and observations.

On the north-side ascending thirty eight feet, upon an artificial bank of earth,

there is a square and narrow passage leading into the Pyramid, thorough the mouth of which (being equi-distant from the two sides of the Pyramid) we enter, as it were, down the steep of an hill declining with an angle of twenty six degrees. The breadth of this entrance is exactly three feet, and four hundred sixty three parts of one thousand of the English foot: The length of it beginning from the first declivity, which is some ten palms without, to the utmost extremity of the neck, or straight within, where it contracts it self almost nine feet continued, with scarce half the depth it had at the first entrance (tho' it keep still the same breadth) is ninety two feet and an half. The structure of it hath been the labour of an exquisite hand, as appears by the smoothness and evenness of the work, and by the close knitting of the joints. A property long since observed, and commended by Diodorus, to have run thorough the fabrick of the whole body of this Pyramid. Having passed with tapers in our hands this narrow straight, tho' with some difficulty, (for at the farther end of it we must creep upon our bellies) we land in a place somewhat larger, and of a pretty height, but lying incompolled; having been dug away, either by the curiosity, or avarice of some, in hopes to discover an hidden treasure; or rather by the command of Almamon, the deservedly renowned calif of Babylon. By whomsoever it were, it is not worth the enquiry, nor doth the place merit describing, but that I was unwilling to pretermitt any thing: Being only an habitation for bats, and those lo ugly, and of so large a size, (exceeding a foot in length) that I have not elsewhere seen the like. The length of this obscure and broken space, containeth eighty nine feet, the breadth and height is various, and not worth consideration. On the left hand of this, adjoining to that narrow entrance thorough which we passed, we climb up a steep and massy stone, eight or nine feet in height, where we immediately enter upon the lower end of the first gallery. The pavement of this rises with a gentle acclivity, consisting of smooth and polished marble, and were not smeared with filth, appearing of a white and alabaster colour: The sides and roof, as Titus Livinius Burretinus, a Venetian, an ingenious young man, who accompanied me thither, observ'd, was of impolished stone, not so hard and compact as that on the pavement, but more soft and tender: The breadth almost five feet, and about the same quantity the height, if he have not mistaken. He likewise discovered some irregularity in the breadth, it opening a little wider in some

GRAVES

characters, and in order for this and women and women's stones from with these the mids, fastening and iron. They cubits under of the Pyramid, which are fifty made each side is. The beginning a fortunate bon-finished it, be in, from the top painted a solemn ent all the in-ben be built in treasures, filled with, and with stones, and with is of earth, and and with glass yet not broken, and with several and double, and with other things east Pyramid, wars, and what air aspects, and used to them, these matters. Pyramid, the chests of black jest a book, in profession, and ture, and what is, and what of time, to the Pyramid a treasure. Pyramid standing up-bis head a serene near it, and of one side, and wroat, and kill. He made the id, an idol of shining, sitting when any looked e of him a voice, so that he fell ceased not till he

**G**RAVES places than in others; but this inequality could not be discerned by the eye, but only by measuring it with a careful hand: By my observation with a line, this gallery contained in length an hundred and ten feet. At the end of this begins the second gallery; a very stately piece of work, and not inferiour, either in respect of the curiosity of art, or richness of materials, to the most sumptuous and magnificent buildings. It is divided from the former by a wall, through which stooping, we passed in a square hole, much about the same bigness, as that by which we entered into

the Pyramid, but of no considerable length. This narrow passage lieth level, not rising with an acclivity, as doth the pavement below, and roof above, of both these galleries. At the end of it, on the right hand, is the well, mentioned by *Pliny*; the which is circular, and not square, as the *Arabian* writers describe: the diameter of it exceeds three feet, the sides are lin'd with white marble, and the descent into it is by fastning the hands and feet in little open spaces cut in the sides within, opposite, and answer-

pendicular. In the same manner are almost all the wells and passages into the cisterns at *Alexandria* contrived, without stairs or windings, but only with inlets, and square holes on each side within; by which using the feet and hands, one may with ease descend. Many of these cisterns are with open and double arches, the lowermost arch being supported by a row of speckled and *Tebraick* marble pillars, upon the top of which stands a second row, bearing the upper and higher arch: The walls within are covered with a sort of plaister, for the colour white; but of so durable a substance, that neither by time, nor by the water, it is yet corrupted and impaired. But I return from the cisterns and wells there, to this in the Pyramid; which in <sup>b</sup> *Pliny's* calculation, is eighty six cubits in depth; and it may be was the passage to those secret vaults mentioned, but not described by *Herodotus*, that were hewn out of the rock, over which this Pyramid is erected. By my measure, founding it with a line, it contains twenty feet in depth. The reason of the difference between *Pliny's* observation and mine, I suppose to be this, that since his time it hath almost been

dammed up, and choaked with rubbish, which I plainly discover'd at the bottom, by throwing down some combustible matter set on fire. Leaving the well, and going on strait upon a level, the distance of fifteen feet, we entered another square passage, opening against the former, and of the same bigness. The stones are very massy, and exquisitely jointed, I know not whether of that glistering and speckled marble, I mentioned in the columns of the cisterns at *Alexandria*. This leadeth (running in length upon a level an hundred and ten feet) into an arched vault, or little chamber; which by reason it was of a grave-like smell, and half full of rubbish, occasioned my lesser stay. This chamber stands east and west; the length of it is less than twenty feet, the breadth about seventeen, and the height less than fifteen. The walls are intire, and plastered over with lime, the roof is covered with large smooth stones, not lying flat but shelving, and meeting above in a kind of arch, or rather an angle. On the east-side of this room, in the middle of it, there seems to have been a passage leading to some other place. Whether this way the priests went into the hollow of that huge sphinx, as *Strabo* and <sup>1</sup> *Pliny* term it, or androsphinx, as *Herodotus* calls such kinds, (being by *Pliny's* calculation 211 feet in compass about the head, in height 1211, in length 62111: And by my observation made of one intire stone) which stands not far distant without the Pyramid, south-east of it, or into any other private retirement, I cannot determine; and it may be too this served for no such purpose, but rather as a *Thebes* or *Nichio*, as the *Italians* speak, wherein some idol might be placed; or else for a piece of ornament (for it is made of polished stone) in the architecture of those times, which ours may no more understand, than they do the reason of the rest of those strange proportions, that appear in the passages and inner-rooms of this Pyramid. Returning back the same way we came, as soon as we are out of this narrow and square passage, we climb over it, and going straight on, in the trace of the second gallery, upon a shelving pavement (like that of the first) rising with an angle of twenty six degrees, we at length came to another partition. The length of the gallery, from the well below to this partition above, is an hundred fifty and four feet; but if we measure the pavement of the floor, it is somewhat less, by reason of a little vacuity (some fifteen feet in length) as we described before, between the well and the square hole we climbed over. And here to reassume some part of

<sup>b</sup> In Pyramidē maximā est intus puteus LXXXVI cubitorum, fumen illi admissum arbitrantur. *Plin.* l. 36. cap. 12.

<sup>1</sup> *Plin.* l. 36. cap. 12.

with rubbish, the bottom, by possible matter tell, and going distance of square passage, and of the same very massy, and not whether of marble, I mean the cisterns at ending in length ten feet; into amber; which like smell, and shed my lesser east and west; in twenty feet, and the height are intire, and the roof is co-ones, not lying ing above in a angle. On the e middle of it, passage leading er this way the y of that huge y term it, or all such kinds, on 11 feet in n height 111, my observation hich stands not ramid, south- private retire- and it may be purpose, but as the *Italians* ight be placed; ment (for it is the architecture may no more the reason of e proportions, ges and inner- eturning back soon as we are re passage, we ight on, in the upon a shelv- the first) rising degrees, we atartition. The the well below n hundred fifty asure the pave- ewhat less, by me fifteen feet e descende, between e we climbed e some part of

that which hath been spoken, if we consider the narrow entrance at the mouth of the Pyramid by which we descend; and the length of the first and second galleries by which we ascend, all of them lying as it were in the same continu'd line, and leading to the middle of the Pyramid, we may easily apprehend a reason of that strange ecchoe within, of four or five voices, mentioned by *Plutarch* in his fourth book, *De placitis Philosophorum*: Or rather of a long continued sound; as I found by experience, discharging a musket at the entrance. For the sound being shut in, and carried in those close and smooth passages, like as in so many pipes or trunks, finding no issue out, reflects upon it self, and causes a confused noise and circulation of the air, which by degrees vanishes, as the motion of it ceases. This gallery, or *corridore*, (or whatsoever else I may call it) is built of white and polished marble, the which is very evenly cut in spacious squares, or tables. Of such materials as is the pavement, such is the roof, and such are the side walls, that flank it: The coagmentation, or knitting of joints, is so close, that they are scarce discernible to the eye; and that which adds a grace to the whole structure, tho' it makes the passage the more slippery and difficult, is the acclivity and rising of the ascent. The height of this gallery is twenty six feet, the breadth is six feet, and eight hundred seventy parts of the foot divided into a thousand, of which three feet, and four hundred thirty six of a thousand parts of a foot, are to be allowed for the way in the midst; which is set and bounded on both sides with two banks (like benches) of sleek and polished stone; each of these hath one foot seven hundred seventeen of a thousand parts of a foot in breadth, and as much in depth. Upon the top of these benches near the angle, where they close, and join with the wall, are little spaces cut in right angled parallel figures, set on each side opposite to one another; intended, no question, for some other end than ornament. In the casting and ranging of the marbles in both the side-walls, there is one piece of architecture, in my judgment, very graceful; and that is, that all the courses, or ranges, which are but seven (so great are those stones) do set and flag over one another about three inches; the bottom of the uppermost course over-setting the higher part of the second, and the lower part of this overflagging the top of the third, and so in order the rest, as they descend. Which will better be conceived by the representation of it to the

eye in this figure, than by any other description.

Having passed this gallery, we enter another square hole, of the same dimensions with the former, which brings us into two *anticamerette*, as the *Italians* would call them, or *anti-closets*, (give me leave in so unusual a structure to frame some unusual terms) lined with a rich and speckled kind of *Thebaick* marble. The first of these hath the dimensions almost equal to the second: The second is thus proportioned, the *area* is level, the figure of it is oblong, the one side containing seven feet, the other three and an half, the height is ten feet. On the east and west sides, within two feet and half of the top, which is somewhat larger than the bottom, are three cavities, or little seats, in this manner:

Besides these, I have not observed any other sculptures, or engravings, in the whole Pyramid: and therefore it may justly be wondered, whence the *Arabians* borrowed those traditions I before related,

\* Εἰς τοὺς τοιαύτας καὶ τὰς Ἀλγυπτίων παραβολὰς ἔδωκεν οὐκ ἴσως παρὰ τῶν ἰσχυρῶν τῶν τετραγώνων. Plut. lib. 4. de philos. plac. cap. 20.

<sup>1</sup> Sunt enim rebus novis, nova ponenda nomina. Cicero, lib. 1. de naturâ deorum.

GREAVES that all sciences are inscribed within in hieroglyphicks: and as justly it may be questioned, upon what authority Dio, or his epitomizer Xiphilius, reports, that Cornelius Gallus (whom <sup>m</sup> Strabo more truly names Aelius Gallus, with whom he travelled into Egypt, as a friend and companion) <sup>n</sup> engraved in the Pyramids his victories, unless we understand some other Pyramids not now existent. This square passage is of the same wideness and dimensions as the rest, and is in length near nine feet, (being all of Thebaick marble, most exquisitely cut) which lands us at the north end of a very sumptuous and well-proportioned room. The distance from the end of the second gallery to this entry, running upon the same level, is twenty four feet. This rich and spacious chamber, in which art may seem to have contended with nature, the curious work being not inferior to the rich materials, stands as it were in the heart and centre of the Pyramid, equi-distant from all the sides, and almost in the middle between the *basis* and the top. The floor, the sides, the roof of it, are all made of vast and exquisite tables of Thebaick marble, which if they were not veiled and obscured by the steam of tapers, would appear glittering and shining. From the top of it descending to the bottom, there are but six ranges of stone, all which being respectively sized to an equal height, very gracefully in one and the same altitude, run round the room. The stones which cover this place, are of a strange and stupendous length, like so many huge beams lying flat, and traversing the room, and withal supporting that infinite mass and weight of the Pyramid above. Of these there are nine, which cover the roof; two of them are less by half in breadth than the rest; the one at the east end, the other at the west. The length of this <sup>o</sup> chamber on the fourth side, most accurately taken at the joint, or line, where the first and second row of stones meet,

is thirty four English feet, and three hundred and eighty parts of the foot divided into a thousand (that is, thirty four feet, and three hundred and eighty of a thousand parts of a foot.) The breadth of the west side at the joint, or line, where the first and second row of stones meet, is seventeen feet, and an hundred and ninety parts of the foot divided into a thousand (that is, seventeen feet, and a hundred and ninety of a thousand parts of a foot.) The height is nineteen feet and an half.

Within this glorious room (for so I may justly call it) as within some consecrated oratory, stands the monument of *Cheops*, or *Cheemmis*, of one piece of marble, hollow within, and uncovered at the top, and sounding like a bell. Which I mention not as any rarity, either in nature, or in art (for I have observed the like found, in other tombs of marble cut hollow like this) but because I find modern authors to take notice of it as a wonder. Some write, that the body hath been removed hence; whereas <sup>q</sup> Diodorus hath left above sixteen hundred years since, a memorable passage concerning *Cheemmis* the builder of this Pyramid, and *Cephren*, the founder of the next adjoining. *Alibo* (saith he) these kings intended these for their sepulchres, yet it happened that neither of them were buried there: For the people being exasperated against them, by reason of the insolencies of these works, and for their cruelty and oppression, threatened to tear in pieces their dead bodies, and with ignominy to throw them out of their sepulchres: Wherefore both of them dying, commanded their friends privately to bury them, in an obscure place. This monument, in respect of the nature and quality of the stone, is the same with which the whole room is lined; as by breaking a little fragment of it, I plainly discovered, being a speckled kind of marble, with black, and white, and red spots, as it were equally mixed, which some writers call Thebaick marble: tho' I conceive it to be that sort of porphyry which *Pliny* calls *leucostictos*, and de-

<sup>m</sup> Strabo, lib. 17.

<sup>n</sup> Xiphil. in Cæs. Aug. Ταύτην ὅσα ἐκείνη, ἐκ πεντήκοντα ἐξήκοντα.

<sup>o</sup> These proportions of the chamber, and those which follow, of the length and breadth of the hollow part of the tomb, were taken by me with as much exactness as it was possible to do; which I did so much the more diligently, as judging this to be the fittest place for the fixing of measures for posterity. A thing which hath been much desired by learned men, but the manner how it might be exactly done, hath been thought of by none. I am of opinion, that as this Pyramid has stood three thousand years almost, and is no whit decayed within, so it may continue many thousand years longer: and therefore that after-times measuring these places by me assigned, may hereby not only find out the just dimensions of the English foot, but also the feet of several nations in these times; which in my travels abroad I have taken from the originals, and have compared them at home with the English standard. Had some of the ancient mathematicians thought of this way, these times would not have been so much perplexed, in discovering the measures of the Hebrews, Babylonians, Egyptians, Greeks, and other nations. Such parts as the English foot contains a 1000, the Roman foot, on *Constantinus* monument (commonly called by writers, *Pis Colatianus*) contains 967. The Paris foot 1068. The Spanish foot 920. The Venetian foot 1062. The Rhinland foot, or that of *Snellius*, 1033. The Braccio at Florence 1913. The Braccio at Naples 2100. The Derab at Cairo 1824. The greater Turkish Pike at Constantinople 2200.

scribes

scribes thus: *Rubet porphyrites in eadem Agypto ex eo candidis interuentibus punctis leucostictos appellatur. Quantissibet molibus cœdendis sufficiunt lapidicina.* Of this kind of marble there was, and still is, an infinite quantity of columns in *Agypt*. But a *Venetian*, a man very curious, who accompanied me thither, imagined that this sort of marble came from mount *Sina*, where he had lived among the rocks; which he affirmed to be speckled with party-colours of black and white, and red, like this: and to confirm his assertion, he alledg'd, that he had seen a great column, left imperfect amongst the cliffs, almost as big as that huge and admirable *Corinthian pillar*, standing to the south of *Alexandria*; which, by my measure, is near four times as big as any of those vast *Corinthian pillars*, in the *Porticus* before the *Panttheon* at *Rome*; all which are of the same coloured marble with this monument, and so are all the obelisks with hieroglyphicks, both in *Rome* and *Alexandria*. Which opinion of his doth well correspond with the tradition of *Arifides*, who reports, that in *Arabia* there is a quarry of excellent porphyry. The figure of this tomb without, is like an altar, or more nearly to express it, like two cubes finely set together, and hollowed within, it is cut smooth and plain, without any sculpture and engraving, or any relevy and embossment. The exterior superficies of it contains in length seven feet, three inches, and an half. *Bellonius* makes it twelve feet, and *monsieur de Breves* nine; but both of them have ex-

ceeded. In depth it is three feet, three GRAVES inches, and three quarters, and is the same in breadth. The hollow part within, is in length on the west-side, six feet, and four hundred and eight parts of the *English* foot divided into a thousand parts (that is, six feet, and four hundred and eighty eight of the thousand parts of a foot) in breadth, at the north-end, two feet, and two hundred and eighteen parts of the foot divided into a thousand parts (that is, two feet, and two hundred and eighteen of a thousand parts of a foot.) The depth is two feet, and eight hundred and sixty of the thousand parts of the *English* foot. A narrow space, yet large enough to contain a most potent and dreadful monarch, being dead, to whom living, all *Agypt* was too freight and narrow a circuit. By these dimensions, and by such other observations as have been taken by me from several embalmed bodies in *Agypt*, we may conclude, that there is no decay in nature; (so<sup>t</sup> the question is as old as *Homœr*) but that the men of this age are of the same stature they were near three thousand years ago; notwithstanding *St. Augustin*, and others, are of a different opinion. *Quis jam ævo isto non minor suis parentibus nascitur?* Is the complaint of *Solinus* above fifteen hundred years since. And yet in those crypte sepulchrales, at *Rome*, of the primitive Christians, resembling cities under ground: admired anciently by *St. Hierom*, and very faithfully of late described by *Bosius*, in his *Roma subterranea*, (for I took so much pains for

<sup>t</sup> Which may also be confirmed by *Bellonius's* observations; who describing the rock, on of which, upon *Moses* striking it, there gushed out waters, makes it to be such a speckled kind of Thebaick marble: *Est una grosse pierre massive droite de même grain & de la couleur, qu'est la pierre Thebaïque.*

<sup>t</sup> The compass of the *Scapus* of this column at *Alexandria*, near the *Torus*, is XXIV *En*, *l'île* c: the compass of the *Scapus* of those at *Rome*, is XV *English* feet, and three inches. By these proportions, and by those rules which are expressed in *Petrusius*, and in other books of architecture, the ingenious reader may compute the true dimensions of those before the *Panttheon*, and of this at *Alexandria*; being, in my calculation, the most magnificent column that ever was made, of one entire stone.

<sup>t</sup> *Pervenitur in elegans cubiculum quadrangulum sex passus longum, & quatuor latum, quatuor vero vel VI orgyis altum, in quo marmor nigrum solidum in cistâ formam excisum invenimus XII pedes longum, V altum, & totidem latum, sine operculo.* *Bellon.* Ober. lib. 2. cap. 4.

<sup>t</sup> Les voyages de monsieur de Breves.

<sup>t</sup> 6 Feet

<sup>t</sup> 488

<sup>t</sup> 1000

<sup>t</sup> 2 Feet <sup>218</sup> In the reiteration of these numbers, if any shall be offended, either with the novelty or tediousness of expressing them so often, I must justify my self by the example of *Vlug Beg*, nephew to *Tamerlane* the great, (for so is his name, and not *Tamerlane*) and emperor of the *Moguls*, or *Tatars*, (whom we term amiss the *Tartars*.) For I find in his astronomical tables (the most accurate of any in the east) made about CC years since, the same course observed by him, when he writes of the *Græcians*, *Arabians*, *Persians*, and *Gelætan epocha's*; as also of those of *Cates* and *Turkistan*. He expresseth the numbers at large, as I have done, then in figures, such as we call *Arabian*, because we first learned these from them; but the *Arabians* themselves fetch them higher, acknowledging that they received this useful invention from the *Indians*; and therefore, from their authors, they name them *Indian figures*. Lastly, he renders them again in particular tables, which manner I judge worthy the imitation, in all such numbers as are radical, and of more than ordinary use. For if they be only twice expressed, if any difference shall happen by the neglect of scribers, or printers, it may often so fall out, that we shall not know which to make choice of; whereas if they be thrice expressed, it will be a rare chance but that two of them will agree; which two we may generally presume to be the truth.

8 G

my

**G**RAVES my own satisfaction, as to enter those wonderful grots, and compare his descriptions) I find the bodies entombed, some of them being as ancient as *Solinus* himself, no way to exceed the proportions of our times.

It may be justly questioned how this monument of *Cheops* could be brought hither, seeing it is an impossibility that by those narrow passages, before described, it should have entered. Wherefore we must imagine that by some *machina* it was raised and conveyed up without, before this oratory or chamber was finished, and the roof closed. The position of it is thus: it stands exactly in the meridian north and south, and is, as it were, equidistant from all sides of the chamber, except the east, from whence it is doubly remoter than from the west. Under it I found a little hollow space to have been dug away, and a large stone in the pavement removed, at the angle next adjoining to it: which *Sands* erroneously imagines to be a passage into some other compartment: dug away, no doubt, by the avarice of some, who might not improbably conjecture an hidden treasure to be repositied there. An expenceful prodigality, out of superstition used by the ancients, and with the same blind devotion taken up, and continued to this day in the East-Indies. And yet it seems by *Josephus's* relation, that by the wisest kings, in a time as clear and unclouded as any, it was put in practice, who thus describes the funeral of king *David*: *His son Solomon buried him magnificently in Jerusalem, who, besides the usual solemnities at the funerals of kings, brought into his monument very great riches, the multitude of which we may easily collect by that which shall be spoken. For thirteen hundred years after, Hyrcanus the high-priest, being besieged by Antiochus, surnamed Pius, the son of Demetrius, and being willing to give money to raise the siege, and to lead away his army, not knowing where to procure it, he opened one of the vaults of the sepulchre of David, and took thence three thousand talents; part whereof being given to Antiochus, he freed himself from the danger of the siege, as we have elsewhere declared. And again, after many years, king Herod opened another vault, took out a great quantity of money; yet neither of them came to the coffins of the kings; for they were with much art hid under ground, that they might not be found by such as entered into the sepulchre.*

The ingenious reader will excuse my curiosity, if before I conclude my descrip-

tion of this Pyramid, I pretermitt not any thing within, of how light a consequence soever. This made me take notice of two inlets, or spaces, in the south and north sides of this chamber, just opposite to one another; that on the north was in breadth seven hundred of a thousand parts the *English* foot, in depth four hundred of a thousand parts; evenly cut, and running in a straight line six feet, and farther, into the thickness of the wall. That on the south is larger, and somewhat round, not so long as the former, by the blackness within, it seems to have been a receptacle for the burning of lamps. *T. Livius Bursetinus*, would gladly have believed, that it had been an hearth for one of those eternal lamps, such as have been found in *Tulliola's* tomb in *Italy*; and, if *Camden* be not misinformed, in *Englana* in the *cryptoporticus* of *Fl. Valerius Constantius*, father to *Constantine* the great, dedicated to the urns and ashes of the dead; but I imagine the invention not to be so ancient as this Pyramid. However, certainly a noble invention; and therefore pity it is it should have been smothered by the negligence of writers, as with a damp. How much better might *Pliny*, if he knew the composition of it, have described it, than he hath done the *linum albestinum*, a sort of linen spun out of the veins, as some suppose, of the *Caristian*, or *Cyprian* stone? (which in my travels I have often seen:) tho' *Salmastius*<sup>1</sup>, with more probability, contends the true *albestinum* to be the *linum vivum*, or *linum Indicum*; in the folds and wreaths of which, they enclosed the dead body of the prince; (for, saith *Pliny*, *Regum Indæ funebres tunice*: and no wonder, seeing not long after he adds, *Æquat pretia excellentium margaritarum*) committing it to the fire and flames till it were consumed to ashes: while in the same flames this shroud of linen, as if it had only been bathed and washed (to allude to his expression) by the fire, became more white and refined. Surely a rare and commendable piece of skill, which *Pancirollus* justly reckons among the *deperdita*; but infinitely inferior, either in respect of art or use, unto the former. And thus I have finished my description of all the inner parts of this Pyramid: in which I could neither borrow light to conduct me from the ancients; nor receive any manuduction from the uncertain informations of modern travellers, in those dark and hidden paths. We are now come abroad into the light and sun, where I found my janizary, and

<sup>c</sup> *Sands's* travels.

an *English* captain, a little impatient to have waited above three hours without, in expectation of my return, who imagined what they understood not, to be an impatient and vain curiosity.

<sup>1</sup> That I and my company should have continued so many hours in the Pyramid, and live (whereas we found no inconvenience) was much wondered at by Dr. Harvey, his majesty's learned physician: for, said he, seeing we never breathe the same air twice, but still new air is requisite to a new respiration, (the *juculus albidus* of it being spent in every expiration) it could not be but by long breathing we should have spent the aliment of that small stock of air within, and have been stifled: unless there were some secret tunnels conveying it to the top of the Pyramid, whereby it might pass out, and make way for fresh air to come in, at the entrance below. To which I returned him this answer: That it might be doubted whether the same numerical air could not be breathed more than once; and whether the *juculus*, and aliment of it, could be spent in one single respiration: Seeing those *urinatrices*, or divers under water, for sponges in the *Mediterranean* sea, and those for pearls in the *sinus Arabicus*, and *Persicus*, continuing above half an hour under water, mult needs often breathe in and out the same air. He gave me an ingenious answer, That they did it by help of sponges filled with oil, which still corrected and fed this air; the which oil being once evaporated, they were able to continue no longer, but must ascend up, or die. An experiment most certain and true. Wherefore I gave him this second answer: That the fuliginous air we breathed out in the Pyramid, might pass thorough those galleries we came up, and so thorough the straight neck, or entrance, leading into the Pyramid, and by the same fresh air might enter in, and come up to us. Which I illustrated with this similitude: As at the straits of *Gibraltar*, the sea is reported by some to enter in on *Europe* side, and to pass out on *Africa* side; so in this straight passage, being not much above three feet broad, on the one side air might pass out, and at the other side fresh air might enter in. And this might no more mix with the former air, than the *Rhodanus*, as *Pomponius Mela*, and some others report, passing through the *lacus Lemanus*, or lake of *Geneva*, doth mix and incorporate with the water of the lake. For as for any *tubuli*, to let out the fuliginous air at the top of the Pyramid, none could be discovered within, or without. He replied, They might be so small, as that they could not easily be discerned, and yet might be sufficient to make way for the air, being a thin and subtle body. To which I answered, That the less they were the sooner they would be obstructed with those tempests of sands, to which these deserts are frequently exposed: and therefore the narrow entrance into the Pyramid, is often so choked up with drifts of sand, that there is no entrance into it: wherefore we hire *Moor*s to remove them, and open the passage, before we can enter into the Pyramid, with which he rested satisfied. But I could not so easily be satisfied with that received opinion, That at the straits of *Gibraltar*, the sea enters in at the one side, and at the same time passes out at the other. For besides that, in twice passing those straits I could observe no such thing, but only an inlet, without any outlet of the sea: I enquired of a captain of a ship, being captain of one of the six that I was then in company with, and an understanding man, who had often passed that way with the pirates of *Algier*, whether ever he observed any outlet of the sea on *Africa* side? He answered, No. Being asked, Why then the pirates went out into the *Atlantic* sea on *Africa* side, if it were not, as the opinion is, to make use of the current? He answered, It was rather to secure themselves from being surprised by the Christians, who had near the mouth of the straits the port of *Gibraltar*, on the other side, to harbour in. Wherefore, when I consider with my self the great draught of waters that enter at this strait, and the swift current of waters which pass out of the *Pontus Euxinus*, by the *Bosphorus Thracicus*, into the *Mediterranean* sea, (both which I have seen) besides the many rivers that fall into it, and have no visible passage out: I cannot conceive, but that the *Mediterranean* sea, or *Urinal* (as the *Arabians* call it, from its figure) must long since have been filled up, and swelling higher, have drowned the plains of *Egypt*; which it hath never done. Wherefore I imagine it to be no absurdity in philosophy, to say that the earth is tubulous, and that there is a large passage under ground, from one sea to another. Which being granted, we may easily thence apprehend the reason why the *Mediterranean* sea rises no higher, notwithstanding the fall into it of so many waters; and also know the reason why the *Caspian* sea, tho' it hath not, in appearance, any commerce with other seas, continues salt, (for so it is, *whenever* *Policletus*, in *Strabo*, says to the contrary) and swells not over its banks, notwithstanding the fall of the great river *Volga*, and of others, into it. That which gave me occasion of entering into the speculation was this: In the longitude of eleven degrees, and latitude of forty one degrees, having borrowed the tackling of six ships, and in a calm day founded with a plummet of almost twenty pounds weight, carefully steering the boat, and keeping the plummet in a just perpendicular, at a thousand forty five *English* fathoms; that is, at above an *English* mile and a quarter in depth, I could find no land, or bottom.

## A Description of the Second PYRAMID.

## The second Pyramid.

**G**REAVES FROM the first Pyramid we went to the second, being scarce distant the flight of an arrow. By the way I observed, on the west-side of the first, the ruins of a pile of building, all of square and polished stone; such as <sup>a</sup>Pliny calls *bafaltes*, and describes to be, *ferrei coloris, & duritia*: of an iron colour and hardness: formerly, it may be, some habitation of the priests, or some monument of the dead. To the right hand of this, tending to the south, stands this second Pyramid; of which, besides the miracle, the ancient and modern writers have delivered little. <sup>b</sup>Herodotus relates, that *Cephren*, in imitation of his brother *Cheops*, built this; but that he fell short in respect of the magnitude. For (saith he) we have measured them. It were to be wished for fuller satisfaction of the reader, he had expressed the quantity, and also the manner how he took his measure. He adds, *It hath no subterraneous structures, neither is the Nilus by a channel derived into it, as in the former.* <sup>c</sup>Diodorus somewhat more particularly describes it thus: That for the architecture it is like unto the former, but much inferior to it in respect of magnitude; each side of the basis contains a stadium in length. The same measure, by <sup>d</sup>Strabo, is assigned to the altitude: Each of these, [discouring of the first and second Pyramids] is a fur-

long in height. That is, to comment on their words, of Grecian feet six hundred, of Roman six hundred twenty five: So that by the computation of Diodorus, each side should want an hundred Grecian feet of the former Pyramid. <sup>e</sup>Pliny makes the difference to be greater, for assigning eight hundred eighty three feet to the former, he allows to the side of the basis of this, but seven hundred thirty seven. By my observation, the stones are of colour white, nothing so great and vast as those of the first and fairest Pyramid; the sides rise not with degrees like that, but are all of them plain and smooth; the whole fabrick (except where it is opposed to the south) seeming very entire, free from any deformed ruptures or breaches. The height of it, taken by as deliberate a conjecture as I could make (which it was easy to do by reason of the nearness of this, and the former, being both upon the same plain) is not inferior to it; and therefore Strabo hath rightly judged them to be equal. The sides also of the basis of both are alike; as, besides the authority of <sup>f</sup>Strabo, the Venetian doctor assured me, who measured it with a line. There is no entry leading into it, and therefore what may be within, whether such spaces and compartments, as I observed in the former, or whether different, or none, I must leave to the conjecture of travellers, and to the discovery of after-times.

This Pyramid is bounded on the north and west-sides, with two very stately and elaborate pieces; which I do not so much admire, as that by all writers they have been pretermitted about thirty feet in depth, and more than a thousand and four hundred in length, out of the hard rock, these buildings have been cut in a perpendicular, and squared by the chissel, as I suppose, for lodgings of the priests. They run along at a convenient distance, parallel to the two sides we mentioned of this Pyramid, meeting in a right angle, and making a very fair and graceful prospect. The entrance into them is by square openings, hewn out of the rock, much of the same bigness with those I described in the first Pyramid. Whether these were symbolical (as the theology of the Egyptians consisted much in mysterious figures) and the depresso and lowness of these, were to teach the priests humility; and the squareness and evenness of them, an uniform and re-

**GREAVES** *dorus* I shall adjoin the testimony of <sup>a</sup> *Strabo*: *Farther, upon a higher rise of the hill, is the third (Pyramid) much less than the two former, but built with a greater expence: For almost from the foundation of it to the middle, it consists of black stone, with which they make mortars, brought from the remotest mountains of Æthiopia, which being hard, and not easy to be wrought, hath made the work the more costly.* <sup>d</sup> *Pliny* also, not as a spectator, and eye-witness, as the former, but as an historian writes thus: *The third (Pyramid) is less than the former we mentioned, but much more beautiful: it is erected with Æthiopick marble, and is three hundred sixty three feet between the angles. And this is all that hath been preserved of the ancients concerning this Pyramid. Amongst modern writers, none deserve to be placed before Bellonius, or rather P. Gillius: For* <sup>e</sup> *Thuanus* makes the other to have been a plagiarist, and to have published in his own name the observations of P. Gillius: a man very curious and inquisitive after truth, as appears by his topography of Constantinople, and his *Bosphorus Thracius*, to whom Bellonius served as an amanuensis. *The third Pyramid is much less than the former two, but it is a third part greater than that which is at Rome, near the mons Testaceus, as you pass to St. Paul's in the Ostian way. It is still perfect, and no more corrupted than as if it had been newly built: For it is made of a kind of marble, called basaltas, or Æthiopick marble, harder than iron it self.*

It will be in vain to repeat the traditions and descriptions of several others: All which, by a kind of confederacy, agree in the same tale for the substance, only differing in some circumstances. So that I shrewdly suspect, that *Diodorus* hath borrowed most of his relation from *Herodotus*; and *Strabo* and *Pliny* from *Diodorus*, or from them both; and the more learned moderns from them all: For else how can it be imagined, they should so constantly agree in that, which if my eyes, and memory, extremely fail me not, is most evidently false? And therefore I have a strong jealousy, that they never came near this third Pyramid; but that they did, as I have observed all travellers, in my time, in *Egypt* to do, fill themselves so full, and as it were so surfeit with the sight of the greater and fairer Pyramid, that they had

no appetite to be spectators of the rest, where they should only see the same miracle (for the Pyramids are all of the same figure) the farther they went, decreasing and presented in a less form: Or if they did view this, it was quasi per transennam; very perfunctorily, and slightly; and that through a false and coloured glass; for they have mistaken both in the quality of the stone, and colour of the Pyramid. I begin with <sup>b</sup> *Herodotus*, who by a notable piece of forgetfulness, if it be not a σφάλμα in the copies, makes the dimensions of each of the sides, in the basis of this, to be three hundred feet, and yet to want but twenty of the first Pyramid, to which he assigned before eight hundred feet, an impossibility in arithmetick: And therefore it will be no presumption to correct the place, and instead of ἑξήκοντα ποδῶν καλὰ δέσμευται, to write πεντήκοντα ποδῶν καλὰ δέσμευται. I know not how to palliate or excuse his other error, where he makes this Pyramid to be built as far as to the middle of it, with Æthiopick marble. If this sort of marble be ferrei coloris, as it is described by <sup>i</sup> *Pliny*, and granted by <sup>k</sup> *Diodorus* and <sup>l</sup> *Strabo*, both of these expressing the colour to be black, and the latter bringing it from the remotest mountains of Æthiopia, where the marble hath the same tincture and colour with the inhabitants; then can this relation of *Herodotus* no way be admitted: For the whole Pyramid seems to be of clear and white stone, somewhat choicer and brighter, than that in either of the two other Pyramids. And therefore I wonder that *Diodorus*, *Strabo*, and *Pliny*; and amongst latter authors, *Bellonius*, *Gillius*, and several others, should have all followed *Herodotus*; when with a little pains and circumspection, they might have reformed his and their own error. It may perhaps be alledged in their defence, that they mean, the buildings within are erected with black and Æthiopick marble: And yet if this be granted, since there is no entrance leading into this, no more than is into the second Pyramid, what may be within, depends upon the incertainty of tradition or conjecture, both which are very fallible. Though it cannot be denied, but close by, on the east-side of it, there are the ruins of a pile of building, with a sad and dusky colour, much like that we described in passing to the second Pyramid, which might be the ground and occasion

of this error. I cannot excuse the antients, but *Bellonius*, or *Gillius*, (for it is no matter which of them owns the relation, when both of them have erred) are far more inexcusable: Because it might have been expected from them, what *Livy* supposes, *Novi semper scriptores, aut in rebus certius aliquid allaturus se, aut scribendi arte rudem vetustatem superaturos credunt*. Whereas these on the contrary, have depraved what hath been in this particular, with truth delivered by the ancients. For whereas *Herodotus*, and *Diodorus*, equal the side of the *basis* to three hundred feet, and *Pliny* extends it to three hundred sixty three, they only make it a third part greater than the Pyramid at *Rome*, of *C. Cassius*, near the *mons Testaceus*: So that either they have much enlarged that at *Rome*, or shrunk and contracted this. For the Pyramid at *Rome*, exactly measured on that side which stands within the city, is compleatly seventy eight feet *English* in breadth; to which if we add a third part of it, the result will be an hundred and four; which should be equal to this *Egyptian* Pyramid, in the notion and acceptance of *Bellonius*. An unpardonable oversight, no less than two hundred feet, in a very little more than three hundred. For so much, besides the authority of *Herodotus*, and *Diodorus*, before cited, I take the side of this Pyramid to be, and the altitude to have much the same proportion.

I would gladly have seen in this, the name of *Mycerinus*, the founder of it.

engraven, as \* *Diodorus* mentions: Or that other inscription in the first, whereof *Herodotus* procured the interpretation: But both have been defaced by time. His words are these: \* *In the Pyramid there are Egyptian characters inscribed, which shew how much was expended upon the workmen, in radishes, onions, and garlick; which an interpreter (as I well remember) said, was the sum of a thousand and six hundred talents of silver; which if it be so, how much it is credible was spent in iron, and in meat, and in clothes for the labourers?* Hereby I might have known what to determine of the ancient *Egyptian* letters: I mean not the sacred ones (for those were all symbolical, expressing the abstractest notions of the mind, by visible similitudes of birds and beasts, or by representations of some other familiar objects) but those used in civil affairs. By such sculptures, which I have seen in gems found at *Alexandria*, and amongst the Mummies, I can no way subscribe to the assertion of *Kircherus*, tho' an able man, who in his *Prodromus Coptus*, contends, that the present *Egyptian* or *Coptic* character (which certainly is only a corruption and distortion of the *Greek*) is the same with that of the ancient *Egyptians*. But surely the *Egyptian* character is of a much higher descent: And if we believe *Tacitus* (whose opinion is very probable) they were the first inventors of letters; tho' some ascribe the honour of this invention to the *Phenicians*.

ita memoria bu

*Of the rest of the PYRAMIDS in the Lybian Desert.*

I Have done with these three Pyramids, each of them being very remarkable, and the two first reckoned amongst the miracles of the world. The rest in the *Libyan* desert lying scattered here and there, are (excepting one of them) but lesser copies, and as it were models of these: And therefore I shall neither much trouble my self, nor the reader, with the description of them. Tho' to speak the truth, did not the three first standing so near together, obscure the lustre of the rest, which lie far scattered, some of them were very considerable. And therefore I cannot but tax the omission of the ancients, and the inadvertency of all modern writers and travellers.

lers, who with too much supineness have neglected the description of one of them; which in my judgment is as worthy of memory, and as near a miracle, as any of those three which I have mentioned. And this stands from these south and by west, at twenty miles distance, more within the sandy desert, upon a rocky level like these, and not far from the village whence we enter the *Mummies*. This, as the *Venetian* doctor assured me, and as I could judge by conjecture at a distance, hath the same dimensions that the first and fairest of these; hath graduations, or ascents without, and of the same colour like that, (but more decay'd, especially at the top) and an en-

by the river (Nilus.) Others imagine, that bridges were made with brick: Which, the work being ended, were distributed into private houses. For they conceive, that the Nilus being much lower, could not come to wash them (away.) If I may assume the liberty of a traveller, I imagine, that they were erected, neither as *Herodotus* describes, nor as *Diodorus* reports, nor as *Pliny* relates; but that first they made a large and spacious tower in the midst, reaching to the top; to the sides of this tower, I conceive, the rest of the building to have been applied, piece after piece, like so many buttresses, or supporters, still lessening in height, till at last, they came to the lowermost degree. A difficult piece of building, taken in the best and easiest projection: And therefore it is no wonder, if it were not often imitated by the ancients, and no where expressed or commended, by the great master of architecture *Vitruvius*. Yet surely, if we judge of things by the events, and if we reflect upon the intention of monuments, which are raised by the living to perpetuate the memory of the dead, then is this as commendable a way as any. And there-

fore we see at *Rome*, that tho' by the revolution of so many ages, the *Mausoleum of Augustus* be almost decayed, and the *Septizonium of Severus* be utterly lost, both intended for lasting and stately sepulchres; yet the Pyramid of *C. Cæstius* stands fair, and almost entire: Which is no more to be compared, either for the vastness of the stones, or the whole bulk and fabrick of it, with these, than are the limbs and body of a dwarf, to the dimensions of a giant, or some large *Colossus*.

I have done with the work, but the artificers deserve not to be pretermitted; concerning whom, the observation of *Diodorus* is as true, as it is boldly delivered by him. *It is confessed, that these works (speaking of the Pyramids) far excel the rest in Ægypt, not only in the massiness of the structures, and in the expences, but also in the industry (and skill) of the artificers. The Egyptians think the architects are more to be admired than the kings who were at the expence: For they by their abilities and study, these by their wealth received by inheritance, and by the labours of others erected them.*

\* Admitting this supposition, we may easily apprehend, how those huge stones might, by engines, be raised in a perpendicular, as the work rose, with less difficulty and expence, than either in a slope or traverse line, upon banks of nitre, or bridges of brick, according to the traditions of *Diodorus* and *Pliny*: Both which must have been of a stupendous and almost incredible height. *Suetonius* in *Augusto*. *Spartianus* in *Severo*.

† *Diodor. Sic. l. 1.* Ὁμοιωμένοι τὴν οὐρανὸν τὰ ἔργα ποιεῖν οἱ παῖδες Αἰγύπτου ὁ μὲν τὸ βάρος τῆς κατασκευασμένης καὶ τὰς ἀπορίας, ἄλλα καὶ τὴν πολυτέλειαν τῆς ἱεραρχίας. καὶ οὗτοι διὰ θαυμάσιον μᾶλλον τὰς ἀρχαίων τῶν ἑλλήνων τὸν βασιλεὺς τοὺς παρασκευάζοντες αὐτοὺς εἰς τὰ αὐτὰ χρησάμενοι. τὰς μὲν τῶν ἑλλήνων φύσεις ἐκ τῶν φιλομαγείων, τοὺς δὲ τῶν Αἰγυπτίων πλουσίαν ἐκ τῶν ἀλλοτρίων κυρίας ἐπὶ ταῖς ἀρχαῖς τῶν προτέρων.

## THE CONCLUSION.

AND thus much of the *Sciography*, or of the artificial and architectural part: I shall shut up all with one observation in nature, for the recreation of the reader, recited by *Strabo*, in these words: \* *We ought not to omit one of the strange things seen by us at the Pyramids: Some heaps of stone, being fragments betwixt off, lie before the Pyramids; amongst these are found little stones, some in the similitude and bigness of lentils, some as of grains of barley, which appear half unscaled: They report these are some relics of the provisions which were given to the workmen, and have been petrified; which seems probable enough.*

These, if there were ever any such, are either consumed by time, or scattered by the winds, or buried with those tempests of sand, to which the deserts are perpetually exposed: But *Diodorus*, who not long pre-

ceded him, was not so curious as to deliver this relation.—And were not *Strabo* a writer of much gravity and judgment, I should suspect that these petrified grains (tho' I know such petrefactions to be no impossibility in nature: For I have seen, at *Venice*, the bones and flesh of a man, and the whole head, except the teeth, entirely transmuted into stone: And at *Rome*, clear conduit-water, by long standing in aqueducts, hath been turned into perfect alabaster) are like those loaves of bread, which are reported to be found by the *Red Sea*, converted into stone, and by the inhabitants supposed to be some of the bread the *Israelites* left behind them, when they passed over for fear of *Pharaoh*. They are sold at *Grand Cairo*, handsomely made up, in the manner of the bread of these times; which is enough to discover the imposture. For

\* Ἐὰν τι τῶν ὁρατῶν ἐν ἡμῶν εἰς ταύτας παραβῇ ὡς ἄντι παρακίτων. Ἐὰν γὰρ τῶν Ἀλίουτῶν σαρὶς τοῦ περὶ τὸν πυραμίδων κτλ. ἐν ταύταις δ' ὁρίσται, ψήματα καὶ τυτὰ καὶ μεγάλῃ φασκιδῇ σῆμα, καὶ αἱ αὐτῶν σπέρματα ἐν τῇ ἱεροποιίᾳ ἐπὶ τῶν ἀπολιθωμένων λείψανων τῶν τῶν ἱερέων τροφῆς ὡς ἰσχυρῶς δὲ. *Strabo* l. 17. *Geog.*

GREAVES the scripture makes them to have been unleavened cakes: <sup>b</sup> *They baked unleavened cakes of the dough which they brought forth out of Egypt.* Or else Strabo's relation may be like the tradition of the rising of dead mens bones every <sup>c</sup> year, in *Egypt*: A thing superstitiously believed by the Christians; and by the priests, either out of ignorance, or policy, maintained as an argument of the resurrection. The possibility and truth of it, *Metrophanes, the patriarch of Alexandria*, thought (but very illogically) might be proved out of the prophet *Esay*, <sup>d</sup> *And they shall go forth, and look upon the carcases*

*of the men that have transgressed against me, for their worm shall not die, neither shall their fire be quenched; and they shall be an abhorring unto all flesh.*

But I have digressed too far. The confutation of these, and the description of the *Mummies*, or of the rest of the *Egyptian* sepulchres (for from thence comes the matter of this their supposed resurrection) and that infinite mass, and variety of hieroglyphicks, which I have either seen there, or bought, or transcribed elsewhere, may be the <sup>e</sup> argument of another discourse.

<sup>b</sup> Exod. xii. 39.

<sup>c</sup> *Sands* in his travels writes, that they are seen to rise on Good-Friday. A *Frenchman*, at *Grand Cairo*, who had been present at the resurrection, shewed me an arm which he brought from thence; the flesh shrivelled, and dried like that of the *Mummies*. He observed the miracle to have been always behind him; once casually looking back, he discovered some bones carried privately by an *Egyptian*, under his vest, whereby he understood the mystery.

<sup>d</sup> *Esay* lvi. 24.

<sup>e</sup> An argument intended by me, and for which I made a collection of several antiquities in my travels abroad; but these (and would only these!) have unfortunately perished at home, amidst the sad distractions of the time.

A

# DISCOURSE

OF THE

## ROMAN FOOT

AND

## DENARIUS:

From whence, as from two Principles, the

## MEASURES and WEIGHTS

Used by the ANCIENTS, may be deduced.

---

By JOHN GREAVES, *Professor of Astronomy*  
in the University of Oxford.

---

*Una fides, pondus, mensura, moneta sit una,  
Et status illæsus totius orbis erit.*

Budelius de monetis.

To his truly noble and learned FRIEND,

JOHN SELDEN, Esq;

Burgess of the University of OXFORD,

In the Honourable HOUSE of COMMONS.

SIR,

**T**HAT I should present you, who have so honourably deserved of antiquity, and of your country; and, if I may add mine own obligations, in particular of me, with so small a retribution as a Roman foot, and denarius, may seem more proportionable to mine abilities, than to the eminency of your place and worth. But you, who, to the honour of your profession, have joined the wisdom of the ancients, and justly have merited this elogy,

— Anglorum gloria gentis

Seldenus.

An elogy long since given you by a man, who is deservedly esteemed, πολλῶν ἀνδρῶν ἄλκιον, the learned Hugo Grotius; you are best able to judge of what importance these two are, in the discovery of the weights and measures used by the ancients.

And first, for measures, the  $\mu\omicron\nu\nu$  or cubit of the sanctuary, in the scriptures, Josephus, and the Rabbins: The  $\alpha\iota\upsilon\sigma\tau\iota\lambda\iota\omicron\varsigma$ , and  $\beta\alpha\upsilon\lambda\omicron\nu\iota\omicron\varsigma$   $\pi\acute{\omicron}\lambda\upsilon\varsigma$ , in Herodotus (the former equal to that of Samos: The latter mis-rendered by Pliny and Solinus, pes Babylonius:) The  $\pi\alpha\epsilon\gamma\sigma\alpha\gamma\iota\varsigma$   $\pi\alpha\gamma\sigma\alpha\kappa\omicron\varsigma$ , in Herodotus, containing xxx.  $\sigma\alpha\delta\iota\alpha$ s, in Strabo, sometimes lx. sometimes xl., and sometimes xxx. (but in Hesychius,  $\delta$   $\pi\alpha\epsilon\gamma\sigma\alpha\gamma\iota\varsigma$   $\chi\alpha\epsilon\iota$   $\mu\iota\lambda\iota\alpha$   $\tau\epsilon\tau\tau\alpha\mu\iota\alpha$ ; and in Abulfecia, three miles: With whom, and with the Persians, to this day it is called the  $\sigma$   $\sigma\alpha\tau\alpha\chi$ ) the  $\chi\alpha\iota\tau\omicron\nu$   $\alpha\iota\upsilon\sigma\tau\iota\lambda\iota\omicron\varsigma$  in Herodotus, Artemidorus, and Strabo: The  $\pi\acute{\omicron}\varsigma$   $\beta\alpha\sigma\iota\lambda\iota\kappa\omicron\varsigma$ , καὶ  $\phi\iota\lambda\iota\sigma\iota\gamma\epsilon\iota\omicron\varsigma$ , in Hero: The pes Ptolemaicus and Drusianus, in Hyginus: Besides infinite others depending upon the proportions of some of these: I say, these cannot, after the destruction of those ancient monarchies and republics, any other way be restored, than from such monuments, as, by divine Providence, have escaped the bands of ruin, and continued to these later ages. For were it not that the pes Romanus, or monetalis, as Hyginus terms it, were still extant in Rome, on the monument of Cosutius, and of Tit. Statilius Vol. Aper (for these two columns, the one with the inscription  $\mu\omicron\alpha$ .  $\Theta$ . mentioned by Marlianus and

Phillander: The other with  $\mu\omicron\alpha$ .  $\iota\beta$ . seen by the same Phillander, are both lost) we might utterly despair of knowing the measures of the Hebrews, Babylonians, Persians, Egyptians, Grecians, Romans, and of all others described in classical authors; who could not transmit to posterity the individual measures themselves, but only the proportions they respectively had to one another: which proportions being mere habitudes, cannot, as mathematicians observe, be reduced to the measures of these times, unless either some of the  $\chi\alpha\iota\tau\omicron\nu$   $\alpha\iota\upsilon\sigma\tau\iota\lambda\iota\omicron\varsigma$  themselves were existent; or else exact copies taken from the originals were derived to us.

In like manner it is for weights, the  $\sigma\kappa\alpha$  the  $\sigma\kappa\kappa$  the  $\sigma\kappa\kappa$  of the Hebrews, or  $\alpha\gamma\epsilon\lambda\omicron\varsigma$  of the Chaldeans, which Aruck renders by four  $\square\prime\prime\prime\prime$  zuzim; that is, four denarii (from whence the Persian  $\sigma\iota\gamma\lambda\omicron\varsigma$ , in Xenophon, and Hesychius, may have received its denomination: the  $\tau\alpha\lambda\alpha\iota\omicron\nu$   $\beta\alpha\varsigma\upsilon\lambda\omicron\nu\iota\omicron\varsigma$ , containing seven thousand Attick Drachms; the  $\tau\alpha\lambda\alpha\iota\omicron\nu$   $\alpha\iota\gamma\upsilon\alpha\iota\omicron\nu$  ten thousand; the  $\tau\alpha\lambda\alpha\iota\omicron\nu$   $\sigma\acute{\upsilon}\gamma\omicron\nu$  fifteen hundred; the  $\tau\alpha\lambda\alpha\iota\omicron\nu$   $\alpha\sigma\iota\kappa\omicron\nu$  six thousand, all mentioned by Julius Pollux; the talentum Egyptium, in Varro, containing eighty pondo, or pounds; the talentum Euboicum in Festus four thousand denarii: these, with infinite others, both mensuræ and pondera, whether considered as medica, or georgica, or veterinaria, cannot in our times be restored, but only by such weights of the ancients as are still extant; that is, either by the denarius of the Romans, or  $\delta\epsilon\gamma\chi\mu\iota$  of the Grecians, or by the congius of Vespasian, or by the libræ, and uncie Romanæ, and the like, that have been preserved by antiquaries.

Seeing therefore the denarius is of as great moment for the discovery of weights, as the Roman foot for the knowledge of measures, I have taken these two, as two irrefragable principles, from whence the rest used by the ancients may be deduced. And because the denarius may be considered in a double respect, either as nummus, or as pondus: The first acceptance conducing to the valuation of coins, the second to the certainty of weights: It was

\* The *farfub*, with the ancients and moderns, contains three miles. *Abulf. Geog. MS.*

therefore necessary that both the weight, and valuation of the denarius, should be exactly known. To which purpose, in Italy, I examined with a balance (the scale of which the eighth part of a grain would sensibly turn) many hundred fair denarii, both consulars and caesareis, as also quinarii, or victoriat in silver; several aurei of the former and later emperors; besides the original standard of the congius, placed by Vespasian in the Capitol; and many unciae, and librae, in brass. From whence I collected the weight of the denarius, consularis, and caesareus; that to be the seventh part of the Roman ounce, as Celsus, Scribonius Largus, and Pliny, rightly describe; and this to be sometimes the eighth part, and sometimes the seventh, but most frequently in a middle proportion betwixt eight and seven, till Severus's and Gordianus's times; under whom, and the succeeding emperors, it recovered the weight of the denarius consularis; but lost much of its fineness by the mixture of alloy.

With these denarii, for the greater certainty, I compared such Grecian coins (especially Athenian) as I had either seen in choice cabinets, or bought of mine own; and those were  $\pi\rho\omega\tau\alpha$ , or  $\sigma\alpha\lambda\upsilon\varsigma$ , absolutely taken; which, as Julius Pollux, and Helychius, out of Polemarchus testify, weighed two drachms: The  $\tau\epsilon\lambda\epsilon\delta\epsilon\sigma\chi\mu\alpha$ , or  $\tau\epsilon\tau\epsilon\sigma\chi\mu\alpha$ , or  $\sigma\alpha\lambda\upsilon\varsigma$   $\alpha\rho\gamma\upsilon\epsilon\iota\varsigma$ , four drachms: The  $\delta\epsilon\sigma\chi\mu\alpha$ , the  $\tau\epsilon\lambda\omega\zeta\epsilon\lambda\alpha$ , or as Pollux names them, the  $\eta\mu\iota\delta\epsilon\sigma\chi\mu\alpha$ , with several others.

By which comparison I first discovered, that howsoever the Romans, as Pliny, and A. Gellius expressly; Valerius, and Suetonius, by way of consequence, equal the denarius to the drachma: And tho' the Greeks, as Strabo, Cleopatra, Plutarch, Galen, Dio, and many more, equal the drachma to the denarius, speaking in a popular estimation, and as they vulgarly passed in way of commerce, yet if we shall put on the resolution of him in the comedy,

Oculatæ nostræ sunt manus, credunt quod vident:

We may evidently discern in the scale, the drachma Attica to be heavier than the denarius: And therefore all such writers of the ancients, as equal them, if we speak strictly of weight, and not of estimation, have been deceived; and consequently, all modern writers following their traditions, in discourses de

ponderibus, & de re nummariâ have erred.

But because it is not probable, that the ancients, both Greeks and Romans, should be deceived in their own coins, and in their own times; it occasioned me by observing the practice abroad of the  $\kappa\alpha\lambda\upsilon\sigma\tau\alpha\iota$  in exchanges, with whom the same specifical coins, in different states, pass with different estimations, to think of some means how I might reconcile the traditions of the Greeks and Romans, concerning the weight and valuation of the drachma Attica and denarius; notwithstanding the difference in the balance, of such as are now found at Athens, and at Rome.

And this drew from me that discourse which I have inserted at the end of this book: Of some directions to be observed in comparing the valuations of coins: Which may serve, not only to reconcile the Greek and Roman writers, but especially the traditions of Philo, Josephus, Epiphanius, St. Hierom, and Helychius; who make the Hebrew  $\pi\pi\omega$  shekel, equal to the Attick tetradrachm, whereas in the scale, which is the best judge of this controversy, I find them manifestly unequal; the Hebrew, or Samaritan shekel, being much less than the Attick tetradrachm.

But it may be questioned, Why after the labours of Portius, Budæus, Alciatus, Agricola, Montanus, Mariana, Budelius, Alcasar, Villalpandus, Jo. Scaliger, Capellus, Snellius, and of many other eminent men who have writ, either dedita opera, or  $\epsilon\iota\varsigma$   $\pi\alpha\rho\iota\delta\alpha$ , de ponderibus & mensuris, I should undertake any thing of this nature? My answer is, that observing in them so great a variety, and contradiction of opinions, I was willing to use mine own judgment, how mean soever, in giving my self private satisfaction. And tho' I intended this work as a  $\pi\alpha\rho\iota\delta\alpha$  to other employments; yet having, by the advantage of travelling in foreign parts, perused in Italy, Greece, and Egypt, more antiquities than I think any of them above-named single, I thought it would not be unacceptable, if I did, as it is the manner of travellers, publish at home, such observations and discoveries as I made abroad. The which I humbly dedicate to you, as out of a desire to express my gratitude for many noble favours, So out of an assurance, that if they receive your approbation, I need not to fear the censure of others.

Your most obliged friend, and humble servant,

JOHN GREAVES.

## Of the Roman FOOT.

GRAVES

**T**HAT the foot was the most received and usual measure amongst the Romans, as the cubit amongst the Jews, is a thing not controverted by any: for Polybius describing their *scutum*, makes it in breadth over the bend, two [Roman] feet and a half, and in length four feet: Or if it be of a greater sort, a palm more is to be added to this measure. And not long after, expressing the manner of their castrametation, or encamping, he writes: That as often as a place is designed for the camp, the *prætorium* (or general's lodging) takes up that part, which is fittest for prospect and direction. Setting therefore up the standard, where they intend to fix the *prætorium*, they so measure out the square about a standard that each side may be distant from it an hundred feet, and the whole area contain four *jugera*. In like manner *Cæsar*, in the description of his bridge over the Rhine, makes the binders, or transversary beams, to be *bipedales*. Tully also judges the quantity of the apparent diameter of the sun to be *pedalis*. And not to produce more authorities, Suetonius relates, That Augustus presented before the people of Rome, Lucius, a young gentleman, ascended, only for to shew that he was 17 two feet in height, seventeen pounds in weight, and of an immense voice. But concerning the precise quantity of this foot, there is not any one thing after which learned men have more enquired, or in which they do less agree: For *Budeus* equals it to the Paris foot; *Latinus Latinus*, *Matheus*, *Ursinus*, and others, deduce it from an ancient monument in the Vatican of *T. Statilius Vol. Aper*. *Portius Vicentinus*, *Philander*, *Georgius Agricola*, *Gbetaldus*, *Donatus*, and several others, contend the foot on *Cossutius* monument in Rome, to be the true Roman foot: *Martianus* describes it out of a porphyry column, with this inscription, *NOA. O. Lucas Pætus* defines it from some brass feet found amongst the *rudera* in Rome: *Villalpandus* derives it from the measure of the *congus*, placed by *Vespasian* in the Capitol (the original standard being still extant): *Willebrordus Snellius* equals it to the *pes Rhinlandicus*; and several others have had several fancies and conjectures. In such a variety and uncertainty of opinions, we have no more solid foundation of our inquiry, than either to have recourse to the writings

of the ancients, or else to such other monuments of antiquity, as having escaped the injury and calamity of time, have continued intire to this present age.

And first for the ancients: *Vitruvius* in his third book of architecture, gives this description of the Roman foot: *E cubito cum dempti sunt palmi duo, relinquitur pes quatuor palmorum. Palmus autem habet quatuor digitos, ita efficitur nti pes habeat xvi digitos, & totidem asses æreis denarius.* *Columella* shews, that it was the basis and foundation to all their other measures: *Modus omnis areæ pedali mensurâ comprehenditur, qui digitorum est xvi. Pes multiplicatus in passus, & adus, & climata, & jugera, & stadia, centuriæque, mox etiam in majora spatia procedit. Passus pedes habet v.* *Frontinus* more clearly and distinctly expresseth the several parts and divisions of it. *Pes habet palmos iv. uncias xii. digitos xvi. Palmus habet digitos iv. uncias iii. Sextans, quæ eadem dodrans appellatur, habet palmos iii. uncias ix. digitos xii.* From which authority of *Frontinus*, and the place before cited of *Vitruvius*, we may collect some analogy to have been observed in the proportions of the Roman foot, and of the Roman coins: For as the *denarius* contain'd xvi asses, so the foot contained xvi digitos: And as the assis was divided in xii uncias, so likewise the foot was divided in xii uncias; and therefore the *dodrans* is used by *Frontinus*, and the *semuncia* and *scilicibus* by *Pliny*, for proportionable parts of the Roman foot; as the same are used by other classical authors for proportionable parts of the Roman assis, and uncia. From which analogy, the *pes Romanus*, I suppose, is termed by *Hyginus*, *pes monetalis*. Likewise in the ancient law of the xii tables (which Tully calls the fountain of the civil law) the *sestertius pes* hath the same proportion with the *sestertius* in coins: For as the *sestertius*, according to *Arruntius*, was olim *dupondius & semis*, anciently two pounds of brass and a half, so the *sestertius pes* was two feet and a half. *Volusius Martianus*, "*sestertius duos asses & semissem, quasi semis tertius; Græca figura ἑξάμονον ἡμιδράκων. Nam sex talenta & semitalentum eo verbo significantur. Lex etiam xii tabularum argumento est, in qua duo pedes & semisiss, sestertius pes vocatur.* But to return to *Frontinus*, who farther

<sup>a</sup> Polyb. l. 6. <sup>b</sup> Polyb. *ibid.* Τὸ πῶς δὲ τῆς σκαμνίας, ὃ πάλαιον καλεῖται, τὸν περὶ ἀποκρίσεως πῶς τῆς σκαμνίας τὸ πῶς τῆς σκαμνίας πῶς.

<sup>i</sup> Arruntius ex editione Gotafredi. <sup>k</sup> Vol. Met. de assis distrib. discouffing

discourſing of the Roman foot, gives a diſtinction of three ſorts of feet: and thoſe were firſt, *pes porreſtus*; next, *pes conſtratus*, or as *Agriſcola* reads it, *conſtratus*; and laſtly, *pes quadratus*. The firſt was the meaſure of longitudines, the other two of ſuperficies. There were, writes *Frontinus*, *In pede porreſto ſemipedes duo, in pede conſtrato ſemipedes quatuor, in pede quadrato ſemipedes octo*. Which words of his are to be thus explicated; the *pes porreſtus* was the Roman foot extended in length, and therefore there were in it *ſemipedes duo*: the *pes conſtratus*, was the ſquare of the *ſemipes*, and therefore the perimeter of it contained *ſemipedes quatuor*; or, which is all one, two entire Roman feet: the *pes quadratus*, was the ſquare of the Roman foot; wherefore of neceſſity there muſt be four feet in the perimeter, or in *Frontinus's* expreſſion, eight *ſemipedes*. The ſame *author* likewiſe in his book *de aqueductibus*, deſcribing the digit and uncia of this, (*Eſt autem digitus, ſays he*) *ut convenit, ſexta decima pars pedis, uncia duodecima* uſeth a diſtinction of digits, as he did of feet before, not mentioned by any other author, *Quemadmodum autem inter unciam, & digitum diverſitas, ita & ipſius digiti ſimplex obſervatio non eſt, nam alius vocatur quadratus, alius rotundus. Quadratus tribus quartis decimis ſuis rotundo major: rotundus tribus undecimis ſuis quadrato minor eſt*. The proportions here aſſigned by him to the *digitus quadratus*, and *rotundus*, are the ſame which *Archimedes* long before uſed: and thoſe are, that a circle hath the ſame proportion to the ſquare of the diameter, that *xii*. hath to *xiv*. *Hero* alſo, diſcourſing of ſeveral ſorts of meaſures, informs us thus concerning the foot: *Ὁ μὲν δακτύλος, μίσην ἐστὶ ἐμμερότατον. ἡ δὲ δοχμὴ ἐστὶ δακτύλων δ', ὅππῃ μίσην ἢ δακτύλου δόχμην παλαιστὴ τε ἢ δῶρον καλεῖται. ἡ δὲ λυγὰ ἐστὶ δακτύλων ἑ, πὶ δ' ὀρθόδωρον ἑ, ἡ δὲ αὐθαμνὴ ἑβ', ὡς πῆς δοχμῶν δ', ἥτοι δακτύλων ἑ, ἡ δὲ πυγμαὶ δακτύλων ἑ, ὡς πυγῶν κ', ὡς πῆχυν κδ', ἥτοι δοχμῶν ε', ἡ δὲ ὀρβυὰ πηχῶν δ', ἥτοι ποδῶν ε', The digit is the leaſt meaſure, the palm conſiſts of *iv* digits, and is called *daetylodochme*, and *palaiſte*, and *doron*. The *licbas* is ten digits, the *orbodoron* eleven, the ſpan *xii*. The foot hath *iv* palms, or *xvi* digits, the *pygme* *xviii* digits, the *pygon* *xx*, the *cubit* *xxiv*, or *vi* palms, the *orgyia* *iv* cubits, or *vi* feet. Moſt of which meaſures the Romans borrowed from the Greeks; as on the contrary, the Greeks borrowed the *iſſeron*, and *milium*, from the Roman *jugum* and *milliare*. The ſame *Hero* de-*

ſcribes another ſort of foot uſed in Italy: *Ὁ δὲ Ἰταλὸς πῆς δακτύλων ἐξ ἑπτὰς ἢ οὐκ ἑπτὰς. The Italian foot contains thirteen digits, and one third*. Whence *Salmaſius* concludes, that the Romans uſed one ſort of foot in Rome, conſiſting of *xvi* digits; and in ſome parts of Italy another, being but *xiii* digits, and one third. Which might be granted, did not *Hyginus*, who is much antienter, in his tract, *de Limitibus conſtituendis*, contradict it. His words are theſe: *Item dicitur in Germaniā in Tugris pes Drufianus, qui habet monetalem, & ſeſcunciam, ita ut ubicunque extra fines, legifque Romanorum, id eſt, ut ſollicitus proferam, ubicunque extra Italiam aliquid agitur inquirendum; & de hōc ipſa conditione diligenter præmoneo, ne quid ſit, quod præteritiſſe videamur*. Where ſpeaking immediately before of the *pes Romanus*, or as he alſo calls it, the *pes Monetalis*, by which he meaſures and defines the limites, he gives us this caution, That out of Italy (for in Italy he ſuppoſes one meaſure to be generally received) we are to obſerve the quantity of the foot, or meaſure of the country. And for this reaſon, to avoid ambiguity, he aſſigns the proportions of the *pes Drufianus*, at *Tongerē* in Germany, to be a *ſeſcuncia*, more than the *pes monetalis* uſed at Rome, and in Italy. And ſo in another part about *Cyrene*, which *Ptolemy* gave to the Romans: *Pes eorum qui Ptolemaicus appellatur habet monetalem pedem, & ſeſcunciam*. But to omit the *pes Ptolemaicus*, (for our inquiry is only of the Roman foot) I cannot but wonder at the miſtake of *Joſeph Scaliger*, concerning the *Pes Drufianus*, and *Romanus*, who thus writes: *Pes igitur ille Drufianus major eſt Romana ſeſcuncia, ſuis enim xxi digitum, quantorum xvi eſt pes Romanus*. If it were but a *ſeſcuncia*, greater than the Roman foot, as *Hyginus*, and he alſo make it, how can it poſſibly be *xxii* digitum? Or how can he excuſe his words, which immediately follow? *Ex quo colligitur pedem Drufianum omnino eſſe eum, qui bodie in Gallia, & Belgia in uſu eſt, qui proſeſſo major eſt vi digitis, quantorum xvi eſt pes, qui Romæ in borti Angeli Colotii ſculptus in ſaxo viſitur. Eum enim nos cum pede Gallicano comparantes, id veriffimum eſſe deprehendimus*. Neither is the error of ſome others much leſs, in making the *pes Monetalis*, or *Romanus*, and *pes Regius Pbilætaris*, to be equal. Becauſe the Roman foot conſiſted of *xvi* digits, as *Frontinus* writes, and the *pes Pbilætaris* of as many, as *Hero* ſhews: *Ὁ πῆς ὁ μὲν βασιλικός, ἢ φιλεταίος λυγόμενος ἐξ ἑπτὰς παλαιστὰς δ', δακτύλων ἑ. There-*

fore

**GREYER** fore both these are equal. The error is in supposing all digits to be alike; and therefore the same number of digits being in both, that both are equal. By the same argument we may conclude the Roman foot, and Arabian foot, and the derah, or cubit of these, to be equal to the cubit, or *sejquipes* of the Romans; seeing <sup>a</sup> *Abulfeda*, an Arabian geographer, defines the derah to consist of xxiv digits, and so many also did the Roman *sejquipes* contain. But the observation of <sup>b</sup> *Rhemnius Fannius* in this particular, is much better; which he applies to weights, and we may by analogy assign to measures.

*Semina sex alii siliquis latitantia curvis  
Attribuunt scrupulo, lentes veraciter æsto,  
Aut totidem speltas, numerant, tristefce  
lupinos  
Bis duo, sed si far generatim bis pondus  
ineffet,  
Servarent eadem diversæ pondera gentes:  
Nunc variant. Etenim cuncta non sedere  
certo  
Naturæ, sed lege valent, hominûmque re-  
pertis.*

But to return to the Roman foot: Lastly, We may alledge, <sup>c</sup> *Isidorus Hispalensis*. *Pal-  
mus autem, quatuor habet digitos, pes xvi  
digitos, passus pedes quinque, pertica passus  
duos, id est decem pedes.* And this is that which I find delivered by such of the an-  
cients as are extant. Out of which bare  
and naked descriptions, it is as impossible  
to recover the Roman foot, as it is for ma-  
thematicians, to take either the distance,  
or altitude of places, by the proportions  
of triangles alone, or by tables of signs  
and tangents, without having some cer-  
tain and positive measure given, which  
must be the foundation of their inquiry.  
All that can be collected by these descrip-  
tions, is this, that we may know into how  
many parts the Romans usually divided  
their feet; and all these divisions I have  
seen in some ancient ones. But suppose  
there were no Roman foot extant; how  
by xvi digits, or by iv palms, or by xii  
uncia, (which is the most uncertain of all;  
seeing whatsoever hath quantity, how great  
or small soever it is, may be divided in xii  
uncias) could it be precisely restored? For  
if that of <sup>d</sup> *Protagoras* be true, as well in  
measures, as in intellectual notions, that  
man is μέτρον πάντων μέτρον: Whence  
<sup>e</sup> *Vitruvius* observes, that the Latins de-  
nominated most of their measures, as *their  
digit, palm, foot, and cubit*, from the parts

and members of a man: Who shall be  
that perfect and square man, from whom  
we may take the pattern of these measures?  
Or if there be any such, how shall we know  
him? Or how shall we be certain the an-  
cients ever made choice of any such? Unless,  
as some fancy, that the cubit of the sanc-  
tuary was taken from the cubit of Adam,  
he being created in an excellent state of  
perfection: So we shall imagine these di-  
gits, and palms, to have been taken from  
some particular man of compleater lineam-  
ents than others. On the other side, if  
this foot may be restored by digits, and  
palms of any man at pleasure, since there  
is such a difference in the proportions of  
men, that it is as difficult to find two of  
the same dimensions, as two that have the  
same likeness of faces, how will it be pos-  
sible, out of such a diversity, to produce  
a certain positive measure, consisting in an  
indivisibility, not as a point doth in re-  
spect of parts, but in an indivisibility of  
application, as all originals and standards  
should do? The Arabians to avoid this dif-  
ficulty, shew us a more certain way, as they  
suppose, how to make this commensural digit,  
and consequently the foot: and that is by the  
breadth of six barley-corns laid one conti-  
guous to another: for thus <sup>f</sup> *Mubammed Ibn  
Mesoud*, in his book, entituled in Persian,  
*Gebandaniyb*, relates: *That in the time of Al-  
mamon* (the learned calif of Babylon) by the  
elevation of the pole of the Equator, they mea-  
sured the quantity of a degree upon the globe of  
the earth, and found it to be fifty six miles,  
and two thirds of a mile: every mile con-  
taining four thousand cubits, and each cubit  
twenty four digits, and every digit six barley-  
corns. The same proportions are assigned  
in the *geographia Nubienfis*, printed in Ara-  
bick at Rome: the cubit is twenty four digits,  
and every digit is six barley-corns. But this  
is as uncertain as the former, and is built  
upon a supposition, that all such are of the  
same dimension: whereas those of one coun-  
try differ much from those of another;  
and those of the same country (as I have  
made trial in Egypt, more out of curiosity,  
than as hoping this way to give my self  
satisfaction) are not all of the same bigness:  
And not only so, but in the self same ear,  
there is a sensible difference as experience  
doth shew. And yet *Snellius*, a man much  
to be commended for his abilities in the  
mathematicks, and to be blamed for his  
supine negligence, both in his measure of  
the magnitude of the earth, and in his  
dimensions of the Roman foot, upon these  
slight and weak principles, deduces the A-

<sup>f</sup> *Mubammed Ibn Mesoud's Gebandaniyb.*

Arabian

rabian foot, <sup>d</sup> This containing ninety six grains, such as his Roman foot (for none besides himself will own it) contains ninety. Wherefore some other Arabians, to mend the matter, limit the breadth of one of them, <sup>e</sup> by six hairs of a camel, evenly joined one by another: By which invention their derah being almost answerable to the Roman *sestiquies*, or cubit, shall consist of twenty four digits, and every digit of six barley-corns, and every barley-corn of six hairs of a camel. So that in conclusion the hair of a camel shall be the *minimum* in respect of measures. But this invention, however at the first it may seem somewhat subtle (for we are come now almost as low as atoms) is least of all to be approved. For tho' the supposition were true, that all hairs are of a like bigness in all camels, whereas they are different in one and the same; yet this objection is unanswerable, that seeing hairs are not perfectly round tho' the sense judges them so, but angular, and that with some inequality, as magnifying-glasses plainly demonstrate, it will be very difficult so to size them together, that they shall always take up the same breadth: And if they do not, little errors committed in such small bodies, tho' at the first insensible, will infinitely increase and multiply, in the measuring of great distances, to which these are supposed the foundation. And therefore I cannot but approve the council of <sup>f</sup> Villalpandus, who advised such as will examine measures and weights, to begin with the greater, and not with the lesser. And that there is reason for his assertion, may be made evident, especially in weights, to such as shall make an experiment. For admit there were a standard of ten thousand grains, and another of one grain, it will be easy, by a continual subdivision of the former, with a good balance, to produce a weight equal to the standard of one grain: Yea, tho' at the beginning some little error had been committed, which after many divisions will vanish, and become imperceptible. Whereas on the contrary, the most curious man alive, with the exactest scale that the industry of the most skilful artizan can invent, shall never be able out of the standard of one grain, to produce a weight equal to the weight of ten thousand grains, but that there shall be a sensible and ap-

parent difference; yea, tho' he had that excellent scale mentioned by <sup>g</sup> Capellus at Sedan, which would sensibly be turned with the four hundredth part of a grain. The like difference as we find in weights, we may conceive by analogy to be in measures, when they shall be made out of such little parts as hairs, barley-corns, digits, and the like. And therefore I cannot but disapprove the ordinary course of most geographers, whether *Greeks*, *Latins*, or *Arabians*, that from such nice beginnings measure out a degree upon earth, and consequently the magnitude of this globe. On the contrary, the enterprize of <sup>h</sup> Snellius, in his *Eratosthenes Batavi*, and of our countryman <sup>i</sup> M. Wright, hath been more commendable: Who by the space of a degree on earth, (or which were better of many degrees) have endeavoured to fix measures with more exactness and certainty for posterity. But of this argument I shall have occasion to speak hereafter. And therefore to return to the business in hand.

Since the Roman foot cannot be recovered by hairs, grains, digits, palms, and such like physical bodies, which being of a various and indeterminate magnitude, cannot give, unless by accident, the commensuration of that which ought to be precisely limited and determinated; some relinquishing the former way as erroneous, have endeavoured with much ingenuity, by weights to find out the Roman foot: For there is the same analogy between measures and weights, as between continued and discrete quantities: And as mathematicians by numbers demonstrate, or rather illustrate the affections of lines, superficieses, and geometrical bodies: So by weights, measuring some physical bodies, especially such as are liquid, in cubical vessels, (which are easiest commensurable) we may render the exact quantity of the Roman foot, and by consequence of all their other measures. And therefore <sup>k</sup> Lucas Pæsius, and <sup>l</sup> Villalpandus, have attempted with probable reasons to discover the Roman foot, the one by the *Sextarius*, the other by the Roman *Congius*. For the *sextarius* being the sixth part of the *congius*, and the *congius* containing  $\times$  *librae*, or pounds, as it is manifest by that exquisite standard in Rome, with this inscription:

<sup>d</sup> Snellius in *Eratosth. Batav.* l. 2. cap. 2.

<sup>e</sup> *Aly Kufegy*, who assisted *Ulug Beg* in compiling his astronomical tables in *Perfian* (tables the most exact of any in the *East*) limits their breadth by six hairs of an horse. Every digit is six barley-corns laid evenly together, and the breadth of every barley-corn is six hairs of an horse's tail. Infit. Astron. *Aly Cusky*, MS.

\* P X fig-  
nifies pon-  
da decem.

Again, the *congius* being the eighth part of the *ampbora*, or *quadrantal*, filled with water or wine, as by the testimonies of \* *Dioscorides*, \* *Sex Pompeius*, and of an ancient anonymous Greek author, translated by *Alciat*, it doth appear: If therefore a vessel be made of a cubical figure, which may receive VIII *congi*, or XLVIII *sextarii*, or LXXXIV pounds of water or of wine, out of the sides of this cube, by \* *Rhemnius Fannius* his description, or rather by *Sexius Pompeius*, who is ancients, will the Roman foot be deduced. For both these write (neither is it as yet contradicted by any man) that the longitude of one of the sides of the *ampbora* (being a cube) is answerable to the Roman foot. And here our enquiry would be at an end (supposing the authorities of *Festus* and *Fannius* to be unquestionable) were there not farther some objections, which cannot easily be removed. And those are first, a supposition that we have the true Roman *libra* (for by this we are to find the *congius*, admitting there were none extant, as by the *congius*, the *ampbora*, or *quadrantal*) a thing of as great difficulty as the foot it self. And besides, if this were obtained, yet we cannot have an absolute certainty, that water, or wine, shall in all places alike ponderate; by reason of the different gravity which is observed in natural bodies, tho' they be homogeneous, and of a like substance. Wherefore laying aside all such speculations, as being far from that accurateness which is required, there is no other possible means left for this discovery, but to have recourse to such monuments of antiquity, as have escaped the injury and calamity of time; which is our next, and second enquiry.

And here it will not be amiss to see what learned men, who not long preceded our age have observed out of ancient monuments, concerning the Roman foot: And then to relate what course I took to give my self private satisfaction; which, I hope,

will be also satisfactory to others. *Philander* in his commentaries upon *Vitruvius*, being one of the first that had seen, and diligently perused many ancient measures in Rome (whereas *Portius*, *Agricola*, *Glareanus*, and some others received them upon trust) gives us so much the more certain information. His words are these: *Veruntamen quoniam non statim ex cuiuscunque pollicibus, aut digitis, quis fuerit apud antiquos Romanus pes sciri potest. fastidum me studiosis rem gratam putavi, si ad marginem libri semipedem apponerem, dimensum ex antiquo pede, in marmore, quod est in hortis Angeli Colotii Romæ sculpto, cuius etiam, nisi me fallit memoria, meminit Leonardus Porcius lib. de Sestertio. Eum enim pedem, nos cæteris qui circumferuntur, prætulimus, quod conveniret cum eo, quem sculptum invenimus in alio marmoreo epitaphio T. Statilii Vol. Apri mensuris a sciorum, quod operâ Jacobi Melegbini summi Pont. archibetti ex janiculo non ita pridem resossum, in Vaticanum hortum translatum est. Quamvis jacentem in basilicâ apostolorum columnam ex porphyrite, cum his Græcis in calce literis ΠΟΔ. Θ. id est pedum novem, nos cum dimensi essemus, deprehenderimus non respondere nostro eum, quo usus fuerat ejus columnæ artifex, sed nostro esse majorem duobus scrupulis & besse, id est uncia parte nond. Ut argumentum aliquod esse possit pedis Græci fuisse modulo scapum columnæ factum, quod facilius conicere potuissim, si integra esset alia ex eodem lapide columnæ, quam in viâ latâ est conspiciere jacentem, bis in calce literis ΠΟΔ. ΙΒ. insignitam. Verum quando stadium Herodoto, l. 2. Heroni, Suidæ, cæteris Græcis sit sexcentorum pedum; Plinio, Columelle, cæteris Latinis sexcentorum viginti quinque nostrorum, necesse est Romanum à Græco semuncia superari. Thus far *Philander*. Not long after him, *Lucas Pærus*, having examined the foot on *T. Statilius tomb*, and that other of *Cossutius*, together with several ancient ones in brass, found amongst the *rudera* at Rome, concludes that the true Roman foot, *Diclis* duobus marmoreis comparatus, septima uncia parte, sive uncia scrupulis tribus, & duobus scrupulis sextulis, & sextula semisse brevior est. Much about the same time I find in *Ciaconius*, out of *Latinus Latinus*, another experiment to have been made, by many eminent men together at Rome. Superioribus autem annis (saith \* he) *Ant. Augustinus*, qui postmodum fuit archiepiscopus Tarraconensis, Jo. Baptista Sigbicellus episcopus Faventinus, P. cum terram pedis Rom. quantitatem statuerent, plures ejusd. pedis mensuras simul constituerunt, & eam oelo cum antiquissima diti pedis forma, qua in basi quadam in hortis Vaticanis extat, adamussim conuertere videntes, ex hoc pede quadrato vas conferunt, quod etiam nunc ologinta aqua, vel vini libris, quibus publicè signatis civitas utitur, omnino capere inveniunt, & cum oelo congiis antiquis ita congruere, ut neque minus quidquam, neque amplius inter utraque esset. Quo experimento evidentissime cognoverunt, & libris nostri temporis cum antiquis Romanis esse eadem, cum congiis antiqui vas sub Porsipiano Imp. signatum decem libras contineret, quod etiam nostri temporis libris capiti & hunc esse justum pedem Romanum, cum ex ejus modulo perfectum quadrantal ologinta libras contineret, qua cum congiis antiqui libris ad momentum reponderent. Notwithstanding these observations, Villalpandus, knowing how necessary it was to have the true dimensions of the Roman foot, to find out the proportions of the Hebrew cubit, made new experiments: And after examination of the measures and weights at Rome, he thus concludes: Sed is omnibus tam variis, aliisque multis sententiis prætermisiss, in hac una conqueisimus, ut arbitremur unum Farnesianum congium posse omnes antiquas Romanorum, atque aliarum gentium mensuras, omnique pondera pristina integritati restituere. And in another place, Quapropter alii omnibus conjecturis, argumentationibus, ævis pedibus, marmoris dimensionibus, aut sculpturis, quasi maris fustibus prætermisiss, in hac una pedis longitudine, quasi in portu conqueiscere jam tandem decrevimus. Yet Snellius in his *Eratsibenes Batavus* could not rest satisfied with this foot of Villalpandus, how exquisitely soever he imagines it: For he had a mind to discover it nearer home, making the Rhinland foot equal to the Roman. The proof of this assertion is taken from an ancient Roman armamentarium, or fort, near the sea, not far from Leiden, which by the natives is called, *Het buyt te Brien*: And is supported by Ortelius to have been built by *Claudius Cæsar*, in his intended voyage for Britain, of which Suetonius, and Dio, make mention: *Sive in commodiore legionum, cohortiumque transfectionem, sive quo militis bihernare* (saith Ortelius). *Arvis ipsius fundamenta*, (according to S. Snellius) quadrata sunt forma, & quaqueversum ducentis quadraginta Rhinlandicis pedibus patent. Ut vel hinc Romanæ mensuræ vestigia quàm planissimè agnoscas. *Nam ipsius pedis* duorum Romanorum juxerum magnitudinem complectitur. Juxeri enim mensuram ducentos & quadraginta longitudinis pedes esse,

non est serd quisquam qui ignoret, inquit Quintilianus, l. 1. cap. X. Varro de re rustica libro 1. cap. X. Jugerum quod quadratus duos aclus habet. Aclus quadratus, qui & latus est pedes 120 & longus totidem. Si modius, ac mina Latina appellatur, ut mihi plane dubium non videatur, eos hic Romanæ mensuræ modum secutos, bujas structuræ possiduum ita comprehendisse secundum jugeri mensuram, ut duo jugera, vel alius quatuor contineret. Frontinus de limitibus. Hi duo fundi juncti jugerum definiunt, deinde bac duo jugera juncti in unum quadratum agrum efficiunt, quod sint omnes aclus bini: Ut singula ideò latera ducentos & quadraginta pedes in longum patere necesse sit. Atqui totidem pedibus Rbinlandici singula latera exsporgi Geodætarum experientia confirmat Unde efficitur Romanum antiquum pedem nostro Rbinlandico planè æquari.

After these experiments of so many able and learned men, and those too taken from ancient monuments, it may seem strange, that we should not be able as yet to define the true quantity of the *Roman* foot. For this I can assign no other reasons than these: First that those which have described it, have either not exactly, and with such diligence as was requisite, performed it; or else, if they have been circumspect in this kind, they have committed to compare it with the standards or measures of other nations. On the contrary those which have compared it with the present standards, never took it from the ancient monuments, and originals, which are at *Rome*, but only from some draughts, or schemes delineated in books. Now how uncertain a way this is, doth appear by \* *Villalpandus*, who thus writes: *Ego dum hæc scriberem, hunc Colotianum pedem circino expendi, & in annotationibus Guil. Pbilanderi solersissimi viri, & apud Georgium Agricolum, & apud Lucam Patum, & Stanislavum Orjeffium, & nullum potius reperire alteri æqualem, imò verò neque ejusdem pedis assignatos similes partes.* The same have I observed in those *Roman* feet described by *Portius, Agricola, Pbilander, Patus, Cicconius, and Villalpandus* himself, that they differ one from another. And not only so, but those of the same author, in the same impression, are likewise different. Which last must arise, either by the diverse extension of the paper in the press, when it is moist, or by the unequal contraction of it, when it grows dry, or by some other accident, in the beating and binding. So that tho' it were granted, that so many learned men had found out what we enquire after, the *Roman* foot; yet it is im-

\* Villalpandi apparatus urbis ac templi, par. 2. l. 3. c. 25.  
l. 60.      \* Snell, in Eratosth. Bat. l. 2. c. 2.      \* Villalpand.

<sup>1</sup> Suetonius in Claudio. Dio Hist. Rom.

\* Snell, in Eratosth. Bat. l. 2, c. 2.

<sup>2</sup> Villalpan, de apparatus urbis ac templi, par. 2, l. 3, c. 25.

possible out of those schemes and draughts delivered in their books, for the reason before specified, to attain an absolute certainty. But *Snellius* shews us a remedy of this difficulty, which, in my opinion, is as vain as his *Roman* foot, (seeing by his supposition all paper must shrink alike, be it thick or thin) and that is, to allow one part in sixty for the shrinking of the paper. For so much (saith he) do *typographers* observe, that letters contract themselves, when they are taken off wet from the types.

Wherefore having received small satisfaction from the writings of the ancients, and not much better from the imperfect designations of the *Roman* foot, by modern authors, I proposed to my self in my travels abroad, these ways, which no reasonable man but must approve of. And those were, First, to examine as many ancient measures and monuments, in *Italy*, and other parts, as it was possible. And, Secondly, To compare these with as many standards, and originals, as I could procure the sight of. And last of all, to transmit both these, and them, to posterity, I exactly measured some of the most lasting monuments of the ancients. To this purpose, in the year 1639, I went into *Italy*, to view, as the other antiquities of the *Romans*, so especially those of weights and measures; and to take them with as much exactness as it was possible, I carried instruments with me made by the best artizans.

Where my first enquiry was after that monument of *T. Statilius Vol. Aper*, in the *Vatican* gardens, from whence *Philander* took the dimensions of the *Roman* foot, as others have since borrowed it from him. In the copying out of this upon an *English* foot in brasse, divided into 2000 parts, I spent at least two hours, (which I mention, to shew with what diligence I proceeded in this, and the rest) so often comparing the several divisions, and digits of it, respectively one with another, that I think more circumspection could not have been used; by which I plainly discovered the rudeness and insufficiency of that foot. For besides that the length of it is somewhat too much, (whatsoever *Latinius* out of an observation made by *Ant. Augustinus*, *Sigebellus*, *Pacatus*, *Maffæus*, *Statius*, *Ægius* and *Fulvius Ursinus*, pretend to the contrary) there is never a digit that is precisely answerable to one another. Howsoever it contains 1944 such parts, as the *English* foot contains 2000.

My next search was for the foot on the monument of *Coffutius*, in *hortis Colotianis*, from whence it hath since received its denomination, (tho' it be now removed) being termed by writers, *pes Colotianus*. This foot I took with great care, as it did well deserve, being very fair and perfect: Afterwards collating it with that *Roman* foot, which *Lucas Patus* caused to be engraved in the Capitol, in a white marble stone, I found them exactly to agree; and therefore I did wonder, why he should condemn this with his pen (for he makes some objections against it) which notwithstanding he hath erected with his hands (as appears by the inscription in the Capitol, CURANTE LU: PAETO.) It may be, upon second thoughts, he afterward privately retracted his error, which he was not willing to publish to the world. Now this of *Coffutius* is 1934 such parts, as the *English* foot contains 2000.

Next I sought after that porphyry column mentioned by *Marlianus*, as also by *Philander*, and others, with this inscription, ΠΟΔ. Θ. For if the length of that column were assigned according to the proportion of the *Greek* foot, then would the *Roman* foot be thence deduced; this (as I shall elsewhere shew) containing 24 such parts, as that contained 25: Or if it were made according to the *Roman* foot, as the *Grecians* after their subjection to the *Roman* empire, often used the same measures that the *Romans* did, then had I my desire. But the column being defaced or lost my labour was in vain: And it seems *Patus* about LXX years before made the same enquiry with as little satisfaction.

I should be too tedious in describing the several feet which I have perused in brasse, found amongst the *rudera* at *Rome*, and carefully preserved by antiquaries: Of most of which *Peireskius* hath given a good character, in some letters of his, which I have seen in the hands of *Buchardus*, a learned man, not yet printed; who thus writes: *I cannot sufficiently wonder at the inequality which I have found in the divisions by digits, and inches, of the ancient Roman feet; which seem to me to have been made for fashion-sake, & dicis causâ (as lamps that are found in tombs incapable of oil) more to express the mystery and profession of those that were to use them, than to regulate the measures of any thing besides them.*

Besides these, I examined the ancient structures of the *Romans*, hoping by collating one with another, to deduce the

dimension

dimension of their foot. For I presumed, that those excellent architects, before they began their work, must necessarily propose some models to themselves, according to the proportion of which, they meant to raise their fabricks: Which proportions could not be assigned, but in the parts of some common and received quantity; and this in probability was the Roman foot; being a measure generally used, and by publick authority prescribed. Upon which grounds I measured the stones in the foundation of the Capitol, Domitian's, or rather Vespasian's amphitheatre, the triumphal arks of Titus and Severus, together with that of Constantine the great, and above all that exquisite temple of the Pantheon, built by Agrippa, I know not whether with more cost or art: Concerning which *Sebastianus Serlius* is of opinion, That if all rules of architecture were lost, they might be revived out of this monument alone. And in truth, this place gave me more satisfaction than any other: For most of the white marble stones on the pavement, contained exactly three of those Roman feet on *Coffutius's* monument, and the lesser stones in porphyry contained one and an half.

But yet I thought this not sufficient, unless I went to *Terracina*, which is the ancient *Anxur*, and *LIII* miles distant from Rome: Having read in *Andreas Schottus*, out of *Pighius's Hercules Prodicus*, that near the sea by the *Via Appia*, in the height of a white rock, whence that of *Horace*,

*Impositum saxi latè candentibus Anxur,*

There are described the Roman *decempeda*. And indeed the place is very memorable, for the whiteness, altitude, and hardness of the rock, which notwithstanding is cut away perpendicularly, on the side towards the *Tyrrhene* sea, above an hundred and twenty feet in depth, to make passage for the *Appian* way; and at the space of every *decempeda*, these characters x xx xxx &c. (being almost cubitales) are fairly engraven, in a continued order, descending to cxx. Measuring below the distance between cxx and cx, it amounted to 1x English feet, and  $\frac{11}{16}$  of a foot, computing it from the line engraven above cxx, to the line next under cx. The rest I examined with my eyes, by often comparing the distance between cxx and cx, whether it were equal to that between cx and c, and this again (ascending upwards) to that between c and xc; which manner, though

it be uncertain and conjectural, and far from that exactness I used in all others, yet it was the best means I could then put in practice; and I am confident, that whoever shall measure those spaces, shall find a manifest inequality. To which opinion I am rather induced, because measuring there, in several places, the breadth of the *Appian* way, cut out of the same rock, I found a difference sometimes of one or two inches, or more. It being in one place *xlii* English feet, and  $\frac{11}{16}$  of a foot; in another, *xlii* feet and  $\frac{11}{16}$ ; in a third *xlii* and  $\frac{11}{16}$ . Whereby I concluded, that the ancients, in making that way, had not respect to a mathematical point, (as it was not necessary) but only that if any difference were, it should not be sensible. And such differences have I observed in the white *Corinthian* pillars, in the *Pantheon* before-mentioned, of above an inch or two, in the circuit of the *Scapus* near the *Torus*: which inequality, seeing no eye could discover, the masters of that exquisite work did justly condemn. Whereas the porphyry stones, and those of white marble, on the pavement, are sized so even, and so exactly to the proportions of the Roman foot, that nothing can be more accurate. And this the nature of the work required; for the temple being round, (which hath occasioned the *Italians* vulgarly to call it the *Rotundo*) the circle within could not so exquisitely have been filled up, if there had not been a special care taken in observing the true dimensions in every particular stone. But to return to the rock at *Anxur*: The spaces between those characters, to an eye that shall be intently fixed upon them, will be apparently different. So that I concur in opinion with *Schottus*, that those figures were placed there, to give notice to posterity, how much of the rock had been removed, to make passage for the *Appian* way; and not for any memorial of the Roman measures.

Having measured those places in the *Appian* way at *Terracina*, I made trial of at least xx others between *Terracina* and *Naples*, without any great satisfaction; and therefore, partly the incertainty that I found there, and partly the danger of thieves, discouraged me from measuring the Roman *miliare*; a work conceived to be of great use, for the discovery of the Roman foot. Seeing the *miliare* containing *mille passus*, as the very name imports, and every *passus* consisting of five feet, as *Columella*, and *Isidorus* expressly tell us; here therefore would be five thousand feet

**G**RAEVES to help us to one, could there be but found out a perfect Roman mile. And this I imagined might probably be discovered amongst those many vestigia of Roman ways, which to this day are frequently seen in Italy. Wherefore conferring with *Gaspard Berii*, a man curious and judicious, (as appears by his ichnography of *Roma subterranea* in *Bosius*) as also with *Lucas Holstenius*, a learned companion of *Cluverius*, in those honourable travels of his, for the restauration of the ancient geography: they both informed me that there are still in the *Appian way*, where it passes over the *Pomptina Paludes*, several columns, or lapides miliarii, standing; whereby the Romans divided and distinguished their miles; and which occasioned those phrases, *ad primum, ad quartum, ad centesimum lapidem*, and the like. And these, it may be, at the first were ordinary stones, till *C. Gracchus* caused columns to be erected in their places: *Διαμετρήσας δὲ μίλιον ὁδὸν πᾶσαν (τὸ δὲ μίλιον ὅκτω σάδιον ὀλίγον δυνάει) κίονας λαθύνει στήλαι τοῦ μίλετος καλέσθαι. He measured out, saith Plutarch, by miles, all the ways, the mile containing little less than eight stadia, and placed columns of stone to design the measure.* The thing was of that ornament and use, as that it was afterwards taken up, and continued by the Roman emperors; as appears by these inscriptions, which are fairly engraven on the first column, found amongst the ruins in the *Appian way*, and from thence lately removed into the Capitol, by order of the Senate and people of Rome.

If

If therefore two such columns were found entire, (as I am informed there are four or five in the *decennovium*, standing in a continued order) the distance between two such being exactly measured, would much conduce to the discovery of the Roman foot. Upon which supposition I had almost resolved to have gone thither, as I did to other places, with no other intention, but only to have been a spectator of those columns, and to have trusted to mine own hands, in taking their distances. But upon a more deliberate examination of the business, I perceived that this enquiry did depend upon a very nice supposition: for if the *decempedatores*, or *curatores viarum*, proceeded not with extreme caution, and aimed almost at a mathematical point, in designing the just space of each particular mile (which in a work of that length is not probable; where the inequality of many feet could not be discerned by the eye, and might be admitted without any blemish. For in *Varro's* judgment, *Sensus nullus quod abest mille passus sentire potest*) it could not be, but the same differences, or somewhat like, must have crept in with them, which have been observed amongst us, in our measured and statute miles; out of which it would be a vain attempt exactly to demonstrate the *English* foot. The neglect of which circumspexion, amongst some other reasons that may be assigned, I take to be one, of the diversities which astronomers found in that memorable observation, made in the plains of *Singar*, or *Sinar*, by the command of *Alimamon* the renowned califf of *Baby-*

*lon*, about eight hundred years since, in proportioning the magnitude of a degree upon earth. For having taken the altitude of the pole at two several stations, differing a degree in the heavens, they measured the distance between these stations on earth, going on in the same meridian; where *some of them*, says *Abulfeda*, found it to be fifty six miles, and two thirds; others fifty six, without any fraction. If therefore the Roman *decempedatores*, or *geodate*, used not more circumspexion than the *Babylonian* astronomers (which is not likely) there can be no trust given to their miles, and less trust to the foot that shall be deduced from thence.

Wherefore to come to a conclusion; having made enquiry more ways than it may be any man hath done, and I think with as much caution and exactness as any, it will be necessary after all, to shew amongst so many feet, as are taken to be Roman, which I conceive to be the most genuine and true. And though in such an uncertainty and scarcity of ancient monuments, and in such a diversity of opinions, among modern writers, it may seem too great presumption, positively to define the magnitude of the Roman foot; yet having had the opportunity to have perused in this kind, more antiquities than any that have preceded, I may with the more confidence conclude, that the *pes Colotianus*, in my judgment, is the true Roman foot; and that for these reasons.

For first, It most exactly agrees with some very ancient and perfect Roman feet in brass, found long since amongst the ru-

Appii Forum  
Ad Medias IX.  
Taracina X.

The figure LIII<sup>1</sup> below, signifies the distance of *Tarracina* from *Rome*: which distance may be further proved out of *Appian*, in his third book of the civil wars, speaking of *Augustus*: *Omnes autem ad Tarquiniam dno transportatione per Populorum rationem*. Being about *Tarracina*, which is distant CCCC stadia from *Rome*. The stadia reduced to miles, if we allow VII Greek stadia and an half to a Roman mile, as *Suidas* doth, will make up LIII miles, and one third part of a mile: that is, two stadia and a half over and above. Which fraction *Appian* neglects; and therefore uses the round number CCCC stadia, for LIII miles.

The figure XVIII signifies the *decennovium*, or way passing over the fence, between *Appii Forum* and *Taracina*: so denominated, because it contained nineteen miles in length: which may also be proved out of *Procopius*, where he speaks of the *diuranosion*. This way was paved by *Trajan*, as the inscription shews, and I think first of all by him. Long after it was repaired by *Theodoricus*, according to another inscription that I have seen at *Tarracina*, of which *Gruterus* and *Clauertius* also make mention: where, omitting the titles of *Theodoricus* in the marble we find these words engraven:

DECENNOVII. VIAR. APPIAE. ID. EST. A. TRIP  
VSQVE. TERRACENAM. ITER. ET. LOCA. QVAE  
CONFLVENTIBVS. AB. VTRAQVE. PARTE. PALVDVM  
PER. OMNES. RETRO. PRINCIPVM. INVNDAVERANT  
VSVI. PVBLICO. ET. SECVRITATI. VIANIVM  
RESTITVIT. PER  
PLVRIMOS. QVI. ANTE. NON. ERANT. ALBEO  
DEDVCTA. IN. MARE. AQVA

By this number XVIII signifying the *decennovium*, and by the *itinerarium Hierosolymitanum*, we may safely correct the *itinerarium Antonini*, in which *Tarracina* is placed but XVIII miles distant from *Appii Forum*. And from hence likewise we may certainly know, how far the Christians went to meet *St. Paul*, and that was XXXIV miles. For so much was *Appii Forum* distant from *Rome*, if we subduct XVIII out of LIII; where-as the *itineraries of Bertius* edition make it more.

<sup>1</sup> *Varro* de L. L. lib. 5. <sup>2</sup> *Abulf. Geogr. Arab. MS.*

dera

*Greaves* *dera* at *Rome*; especially with that excellent one (as I remember) of *F. Ursinus*, a learned antiquary. Tho' I cannot deny but that I have seen two ancient feet in brads different from this; the one of *Gualdus*, a very fair one, wanting two parts and a half, of such as this contains a thousand, a small and inconsiderable difference. The second of *Gottifridus*, a gentleman of honourable quality, (to whom I stand obliged for the free donation of several antiquities) which exceeds it by eight parts; but this last hath been made by a very rude and unskilful hand.

Next, the proportions of almost all the white marble stones, as also of those lesser in porphyry, in the pavement of that admirable temple of the *Pantheon*, are either completely three of these feet, or one and a half; which, it is not probable, and in a structure of so much art, should have been the work of chance. Add to this the dimensions of several stones in the foundation of the capitol, in *Titus* and *Severus*, triumphal arches, corresponding either to the whole foot, or conjointly to the whole, and some *uncia*, or digits of it.

Thirdly, The inscription on the same monument where this foot is found, of the *circinus*, the *libella*, the *norma*, and the like, plainly shew, that these were intended to express *Cossutius's* profession, (whom *Pætus* imagines to have been a *sculptor*) and this being intended, I see no reason why the *Roman* foot should have been cut in so fair a relevy, either too short, or too long, when the same hand, and the same pains, might have made it exact. It is true, that the foot upon *Statilius's* tomb, is 1944 such parts. as this is but 1934; whereof the *English* foot taken by me from the iron yard, or standard of three feet, in *Guild-Hall* in *London*, contains 2000: But how rudely, in respect of digits, that foot of *Statilius* is described, I have before discovered. And therefore I wonder that *Philander* in his commentaries upon *Vitruvius*, should in a matter of such high concernment in architecture, proceed with so much inadvertency, affirming that between this of *Statilius*, and that of *Cossutius*, there is no difference. And if he a mathematician hath thus erred, (tho' commonly men versed in those sciences take not up things at too cheap a rate, without due examination) what opinion may we conceive of an-

other observation, made at the same moment, by *Ant. Augustianus*, *Jo. Baptista Sigbicellus*, *P. Orosius Pacatus*, *Achilles Maffæus*, *Achilles Statius*, *Benedictus Ægius*, *Fulvius Ursinus*, *Latinus Latinus*, with as many ancient feet as there were men present? I shrewdly suspect they flattered over their observation, as not regarding in nineteen hundred parts and better, the small excess or defect of ten parts; or not rightly apprehending what might be the consequences of such an error, how little soever, in measuring the vast magnitude of the terrestrial globe, or of the celestial bodies.

Lastly, Besides the authorities of *Portius Vicentinus*, *Georgius Agricola*, *Glareanus*, *Ghetaldus Donatus*, and of many other learned and judicious men, who approve of this *pes Colotianus*, (tho' bare authority is the worst, because the weakest kind of argument) that excellent *congius* of *Vespasian*, now extant in *Rome*, so highly and so justly magnified by *Villalpandus*, may likewise serve to confirm, if not totally my assertion, yet thus far, that I have not exceeded in assigning the true longitude: For by the clear evidences of *Dioscorides*, and of an anonymous author before cited, eight *congi* are the just measure of the *Roman ampóra*, or *quadrantal*; and again by as many testimonies of *Sextus Pompeius*, and *Rhemnius Fannius*, each of the sides of the *ampóra* is equal in longitude to the *Roman* foot. Wherefore having procured by special favour the *congius* of *Vespasian*, I took the measure of it with *milium* (being next to water, very proper for such a work) carefully prepared and cleansed, which being done with much diligence I caused a cube to be made answerable to the true dimension of the *pes Colotianus*; filling up the capacity of which, and often reiterating the same experiment, I found continually the excess of about half a *congius* to remain, and that an *ampóra* made by the *pes Colotianus*, would contain but vii *congi*, and about an half. And therefore I cannot sufficiently wonder at the observation of *Ant. Augustianus*, *Pacatus*, *Maffæus*, *Statinus*, *Ursinus*, and others, with a cube of that foot which is described on *Statilius's* monument: who affirm the *quadrantal* of this exactly to contain eight of these *congi* of *Vespasian*: Whereas upon due examination I confidently affirm, that they have erred. And therefore *Villalpandus*

<sup>a</sup> Luc. Pætus, lib. 1. de antiq. Rom. & Græc. interval. mensuris.

<sup>m</sup> Claconius è Latini Latini observ. de pede Rom. urbis ac templi.

<sup>o</sup> Fragmenta Dioscoridis.

<sup>r</sup> Rhem. Fann. arm. fragm.

<sup>t</sup> It had been better to have made my experiment with water, and then to have weighed it with an exact balance: but because no balances are found in *Rome* so exact as with us, I was fain to measure it with *milium*.

<sup>u</sup> Claconius è Latini Latini observationibus de pede Rom. Cum veram pedis Rom. quantitatem statuere vellent ejus. pedis mensuras simul contulerant. Et earum obo cum antiquissima didi pedis forma, quæ in basi quadam in hortis Vaticanis exstat, admodum convenire videntes, ex hoc pede quadrato vas consecravit, &c. Vide suprà.

<sup>v</sup> Villalpandus, l. 2. disp. 2. c. 11. de apparatu

<sup>p</sup> Sext. Pomp. Festus de verb. signif.

<sup>s</sup> Villalp. de apparatu urbis ac templi, par. 2. l. 3. c. 25.

*pandus*, in this particular, with more judgment and ingenuity hath published his observations, concerning the measure, and precise weight of *Vespasian's congius*, than any other whatsoever. Altho' I cannot be induced to assent to that deduction, which he infers of the *Roman foot*, (from the side of a *quadrantal* containing eight of these *congi*) relying upon the authorities of *Festus* and *Fannius*, against so many evidences produced to the contrary. Wherefore as he is singular in his opinion (for there is not one author of credit which follows his assertion) so is his foot as singular, there being not one of at least ten ancient ones, in the hands of several antiquaries (besides those inscribed on two monuments in *Rome*) which arrive to the proportions of his, by *xxvii* parts in two thousand. As for those other fancies of his (for they are no better) of describing also the *Roman foot*, by the altitude of *Vespasian's congius*, and assigning the *latus cubicum* of the *modius*, the *semicongius*, the *sextarius*, and *bemina*, from certain parallel circles circumscribed about it, (which certainly, as the scheme of the *congius* itself, drawn by me to the full proportion, shews, were delineated without any farther intention than for ornament) I do not think them worth the computation.

And therefore it will be much better, to give some solution to those authorities of *Sextus Pompeius*, and *Rhemnius Fannius*, alledged by him. For the objection which may be raised thence is very material: How the *pes Colotianus* can be the true *Roman foot*, since it is confessed by me, that it doth not precisely answer to the sides of a *quadrantal*, or cube, containing eight of those *congi* of *Vespasian*, or *xxviii sextarii*? Whereas on the contrary, *Festus* expressly writes, that the *quadrantal* was the square (he means the cube) of the *Roman foot*. *Quadrantal vocabant antiqui, quam ex Græco amphoram dicunt, quod vas pedis quadrati, octo & quadraginta capit sextarios.* And *Fannius* confirms the same.

*Pes longo spatio, latèque notetur in angulo, Angulus ut par sit, quem claudis linea triplex. Quatuor ex quadris medium cingatur inane: Amphora sit cubus: Quam ne violare liceret, Sacrare Jovi Tarpeio in monte Quirites.*

We might elevate their authorities by saying, these are only the testimonies of two grammarians, better versed in disputes of words, than critical in measures, which more properly are the speculation of mathematicians: And therefore if *Vitruvius* had affirmed it, much more credit might have been given. But we shall rather say, they wrote what was vulgarly, and commonly, upon tradition, believed, that the

length of one of the sides of the *amphora* was equal to the *Roman foot*: Not that it was precisely and exactly equal, but that of any known measure whatsoever then extant, this came the nearest to it, as indeed it doth; yea, so near, that if at this day the *amphora*, and *Roman foot*, were in use amongst us, many a writer that had never been so curious as diligently to compare them, would not be scrupulous to affirm as much. Which may appear by the practice of *Ant. Augustinus*, *Pacatus*, *Massæus*, *Statius*, *Ursinus*, and of several other learned men, not long before our times: Who tho' they purposely made it their inquiry to discover the true *Roman weights* and measures, and therefore made special use of this *congius* of *Vespasian*, yet have no less erred, as we shewed before, in the dimension of the *amphora*, than both *Festus* and *Fannius* have done. Neither will this answer seem improbable concerning measures, if we shall examine a place or two concerning coins, in which the ancients, and those too of the better sort of authors, have in the very same manner erred. For *Livy* writing that *Marcellus* gave to *L. Banti*, (or *Bandius*) 10 *bigati*, that is *denarii* (so called, because the *biga* was ordinarily stamped upon the reverse of the *denarius*): *Plutarch* describing the same gift, renders it by so many *drachmæ*, the *Grecian* manner of computation; not that the *drachma*, in the exact and intrinsic valuation, was equal then to the *denarius*, or the *denarius* to the *drachma* (as we shall shew in the ensuing discourse) but that in the vulgar and popular estimation, the one passed for the other, being both not much different in their weight, as well as valuation. *Like*wise *Dio* informs us, that *Octavius* promised the *Veteran* soldiers 10 *drachmæ* a man: Whereas *Cicero* expressing the same thing to *Atticus*, terms them 10 *denarii*. And *Suetonius* writes, that *Cæsar*, by testament, gave to each of the common people, *sestertia trecenta*, that is, 1000 *denarii*; which *Plutarch*, both in the life of *Brutus*, and of *Antonius*, renders *δραχμαὶ ἑξήκοντα ὀκτώ*, seventy five *drachms*. In the like manner we may say, that *Festus* and *Fannius* have described the *amphora* by the *Roman foot*; not as if this were the exact measure of it, but as being the most known and nearest proportion, in which, without falling into fractions, it might evenly and roundly be expressed.

And thus have we finished our enquiry after the *Roman foot*: Our next labour should be to compare it with the present standards, and originals, for measures of divers nations. For which I must refer the reader to this ensuing table.

## SEMIPIES ROM.

## The Roman FOOT compared with the measures of divers Nations.

SUCH Parts as the Roman foot, or that on the monument of <i>Coffutius</i> in Rome, contains	1000
The foot on the monument of <i>Statilius</i> in Rome, contains	1005 $\frac{1}{2}$
The foot of <i>Villalpandus</i> , deduced from the <i>Congius</i> of <i>Vespasian</i> , contains	1019 $\frac{65}{100}$
The ancient Greek foot, being in proportion to the ancient Roman foot, as xxv to xxiv, contains	1041 $\frac{67}{100}$
The English foot	1034 $\frac{13}{100}$
The Paris foot	1104 $\frac{45}{100}$
The Venetian foot	1201 $\frac{65}{100}$
The Rbinland foot, or that of <i>Snellius</i>	1068 $\frac{25}{100}$
The derab, or cubit, at Cairo in Egypt	1886 $\frac{25}{100}$
The Persian arish	3306 $\frac{10}{100}$
The greater Turkish pike, at Constantinople	2272 $\frac{08}{100}$
The lesser Turkish pike, at Constantinople, is in proportion to the greater, as 31 to 32	
The braccio at Florence	1978 $\frac{28}{100}$
The braccio, for woollen, at Siena	1284 $\frac{38}{100}$
The braccio, for linen, at Siena	2041 $\frac{37}{100}$
The braccio at Naples	2171 $\frac{66}{100}$
The canna at Naples	7114 $\frac{79}{100}$
The vara at Almaria, and at Gibraltar, in Spain	2854 $\frac{19}{100}$
Il palmo di Architeti, at Rome; whereof x make the canna di Architeti	756 $\frac{98}{100}$
Il palmo del braccio di Mercantia, & di tessito di tela, at Rome; this and the former are both engraven in a white marble-stone in the Capitol, with this inscription, Curante Lu. Pato	719 $\frac{24}{100}$
The Genoa palm	842 $\frac{81}{100}$
The Antwerp ell	2360 $\frac{91}{100}$
The Amsterdam ell	2345 $\frac{40}{100}$
The Leyden ell	2337 $\frac{13}{100}$

## The English FOOT, taken from the Iron-Standard at Guild-Hall in London, and compared with the Standards for Measures of divers Nations.

SUCH parts as the English foot contains	1000
The Roman foot, or that on the monument of <i>Coffutius</i> in Rome, contains	967
The foot on the monument of <i>Statilius</i> in Rome, contains	972
The foot of <i>Villalpandus</i> , deduced from the <i>congius</i> of <i>Vespasian</i> , contains	986
The Greek foot	1007 $\frac{22}{100}$
The Paris foot	1068
The Venetian foot	1162
The Rbinland foot, or that of <i>Snellius</i>	1033
The derab, or cubit, at Cairo in Egypt	1824
The Persian arish	3197
The greater Turkish pike, at Constantinople	2200
The lesser Turkish pike at Constantinople, is in proportion to the greater, as 31 to 32	
The braccio at Florence	1913
The braccio for woollen, at Siena	1242
The braccio for linen, at Siena	1974
The braccio at Naples	2100
The canna at Naples	6880
The vara at Almaria, and at Gibraltar in Spain	2760
Il palmo di Architeti, at Rome; whereof x make the canna di Architeti	732
Il palmo del Braccio di Mercantia, & di tessito di Tela, at Rome; this and the former are both engraven in a white marble-stone in the Capitol, with this inscription, Curante Lu. Pato	695 $\frac{1}{100}$
The Genoa palm	815
The Antwerp ell	2283
The Amsterdam ell	2268
The Leyden ell	2260

This table I made by the Standards, the former by proportion. Of

## Of the DENARIUS.

**A**SI have made for measures, the Roman foot the foundation of my enquiry, and therefore have handled it in the precedent treatise: So for finding out of weights, I shall take the *denarius* as an undeniable principle, from whence those of the ancients, by a necessary consequence may be inferred. For as the unity is in respect of numbers, or the *sestertius* in discourses *de re nummaria*; so is the *denarius* for weights, a fit rise, or beginning, from whence the rest may be deduced. Not but that it were better (as I gave the caution before) if we absolutely consider the exactest ways of discovering weights, to begin with the greater, and by them to find out the less, than by the less to produce the greater; but if we look upon the condition of times, and consider the means that are left after so many revolutions and changes of the *Roman* empire, it will be safer to alter our method. For to this day there are many thousand *denarii* left and amongst these some so perfect and entire, as if they had been but newly brought from the mint; whereas of the *Roman libra*, and ounces, there are but few extant, if compared with these. *Lipsius*, and *Gruterius*, in their inscriptions mention some, and *Patus* some others, besides such as I have seen in the hands of antiquaries, and many of mine own: Most of which differ from one another, either as having been consumed by rust and time, or it may also be by the men that then lived, for their advantage lessened: A thing too often practised amongst us. Wherefore I think it more convenient by the *denarius* to deduce the proof and evidence of these, than by the diversity and uncertainty of these to conclude the *denarius*: And yet if some of the best and fairest of them shall agree with this, I shall think my self so much the more assured.

Now seeing the *denarius* may be considered in a double respect, either as *nummus*, or as *pondus*: In the first acception, the valuation of it in civil affairs is remarkable, in the latter, the gravity and ponderousness: I shall speak no farther of the former, than as it may conduce in some sort to illustrate the latter. The *denarius* was a silver coin in use amongst the *Romans*, passing at the first institution for *dena aera*, or ten *asses*. And so *Vitruvius* expressly

writes, *Nostri autem primò decem fecerunt antiquum numerum, & in denario denos aereos asses constituerunt*. The same thing is attested by *Volusius Metianus*. *Denarius primò asses decem valebat, unde & nomen traxit*. *Pliny*, besides a confirmation of the same valuation, assigns also the time in which it was first stamped. *Argentum signatum est anno urbis à quingentesimo octogesimo quinto, Q. Fabio consule, quinque annis ante primum bellum Punicum, & placuit denarius pro decem libris aëris*: That is, for ten *asses*. For the *asses* both then, and under the first consuls, were *librales*. *Dionysius Halicarnassensis*, *Ἦν δὲ ἀσάριον, χαλκόν νόμισμα, θάξας λίτραν*. The *assis* was a brass coin, weighing a pound. Where by the way, it is worth the observation, the strange, and in mine opinion, the unadvised proportion, betwixt the brass and silver moneys of those times: That ten pounds of brass should be but answerable to the eighty fourth part (for so much, or near it, was the *denarius*) of a pound of silver; or to speak more clearly, that one pound in silver should be equal in valuation to eight hundred forty pounds in brass. Neither can there be any excuse of that error, unless this, that there was then an infinite plenty of the one, and as great a scarcity of the other. However it were, the same proportion is testified by *Varro*, who farther adds; that the *Romans* took the first use and invention of the *denarius*, from the *Sicilians*: *In argento nummi, id à siculis, denarii quòd denos aëris valebant*. And according to this valuation the *denarius* had an impress upon it of the figure X, denoting the *decussis*, or number of the *asses*, as *Valerius Probus* witnesses, and sometimes this character X; both which I have seen, and can shew, in several ancient ones. This latter by the ignorance of scribes formerly in MSS. and of our printers of late, in the edition of *Celsus*, and of *Scribonius Largus*, is represented by an asterisk \*, and by a worse error in the same authors, the figure X expressing the *denarius*, as a *pondus*, is confounded with the figure X expressing a number. From this figure on the *denarius*, or *decussis*, *Vitruvius* calls the intersections of lines, *decusses*, and *decussationes*. And *Columella* useth the phrase *in stellam decussari*, when lines meet diamond-wise, or lozenge-like, as these in the character X or X. Neither did the de-

**GRAVES** *naribus* long pass at the valuation of ten *asses*, nor the *asses* which before, and then were *librales*, continue at one stay; but with the exigencies of the Roman state, the rate of the *denarius* rose, and the weight of the *asses* fell; that is in effect, both the silver and the brass monies came to be augmented in their estimation. For by a public edict of *Fabius Maximus* the dictator, the common wealth being hardly pressed upon by *Hannibal*, the *denarius* came to be priced at *xvi asses*, and the *asses* which were then *sextantarii*, or the sixth part of the Roman pound, (for in the first *Punic* war, by reason of the excessive expences of the state, they first fell from being *librales*, to be *sextantarii*) came now in the second *Punic* war to be *unciales*. The whole progress and manner of this alteration, is by none so well and fully expressed as by *Pliny*, and therefore I shall a little insist upon his words: *Silver*, says he, came to be coined in the five hundred eighty fifth year of this city, *Q. Fabius* being consul, five years before the first *Punic* war, and then the *denarius* passed for *x* pounds of brass, the *quinarius* for *v*, the *sestertius* for *ii* pounds and an half. The weight of the *assis* in brass was diminished in the first *Punic* war, the common-wealth not being able to support the expences, and then it was decreed, that the *asses* should be coined *sextantario pondere*: That is, with the weight of the sixth part of a pound, or two ounces, whereas before they were *librales*. Tho' *Alciatus* here, upon a very gross mistake, contends, that they were then coined *dextantario pondere*, and not *sextantario*; but yet that they were called *asses sextantarii*, because the *sextans*, or sixth part of an ounce was wanting: whereas *Festus* expressly writes: *Grave æs dictum à pondere, quia deni asses singuli pondo libræ efficiant denarium ab hoc ipso numero dictum: Sed bello Punico populus Romanus pressus ære alieno, ex singulis assibus libralibus senos fecit, qui tantundem valerent*. And these words of *Pliny*, which immediately follow those before recited, put it out of controversy. <sup>b</sup> Whereby, says he, five parts were gained, and the debts (of the common-wealth) discharged. I would gladly see by what arithmetic *Alciatus* can demonstrate, that the

common-wealth shall gain five parts, making the *asses sextantarii*, in his sense; whereas on the contrary, taking them in this interpretation (as both <sup>1</sup> *Agricola*, and <sup>2</sup> *Vilalpandus* do) it is a thing most evident. For the whole pound, or *asses*, before consisting of *xii* ounces, being now reduced to two ounces, and these two passing at as high a rate in the valuation of things vendible, as the whole *libra* did, it is plain, that the common-wealth by this diminution of weight, keeping the same constant tenure of the estimation of the *asses*, gain'd ten parts in twelve, that is, five in six; and not one in six, as *Alciatus* would have it. But to omit this digression, and to return to <sup>3</sup> *Pliny*: *Afterwards being oppressed by Hannibal, under Q. Fabius Maximus the dictator, the asses were made unciales, and the denarius passed for xvi asses, the quinarius for viii, and the sestertius for iv. And hereby the common-wealth gained half, yet in the pay of the militia, the denarius was always accounted for x asses. The impress of the silver [that is of the denarius] were the bigæ, and quadrigæ; from whence they are called bigati, and quadrigati. Not long after, by the lex Papiria, the asses came to be semunciales. Livius Drusus, tribune of the people, mixed an eighth part of brass with the silver. Thus far Pliny. Out of which words it is most evident (omitting many passages of his worth our consideration) that as the *denarius* at the first institution passed for *x asses*, so afterwards it was valued at *xvi*. And *Vitruvius* gives a reason, why next to *x*, they made choice of *xvi*, rather than of *xii* or any other proportion: *Quoniam animadvertunt utroque numeros esse perfectos, & sex, & decem, utroque in unum conjece-runt, & fecerunt perfectissimum decussissexi*, where <sup>4</sup> *Budæus* reads *decussissexi*: But <sup>5</sup> *Vilalpandus* *decussis sex*, that it may be better, as he imagines, answer to the Greek, *δύναξις*. <sup>6</sup> *Hujus autem rei, scilicet Vitruvius, autorem invenerunt pedem. E cubito enim cum dempti sint palmi duo, relinquitur pes quatuor palmorum, palmus autem habet quatuor digitos, ita efficitur uti pes habeat sexdecim digitos, & totidem asses æreos denarius.* <sup>7</sup> *Metianus* also purposely treating of this argument, after that he had related that*

<sup>5</sup> *Vol. Metianus de assis ditrib.*

the *denarius*, at the first institution, was valued at *x asses*, adds, *now it is worth xvi*. And not to cite more authorities, the impress or stamp of *xvi*, as well as of *x*, found upon several *denarii*, and seen both by *Antonius Augustinus*, (a man very accurate in coins, as appears by his dialogues) and by *Villalpandus*, besides one with the inscription of *C. Titinius*, with the same character, mentioned by *Fulvius Ursinus*, and *Dalechampius* puts it out of controversy. And this valuation of the *denarius*, as it is more than probable, continued from the first institution of it in the second *Punic* war, without any interruption, to *Justinian's* time, and it is likely longer; since there is no proof out of any ancient author, nor any character on any ancient *denarius* found to the contrary. As for those authorities which are alledged, and pressed by *Budæus*, and *Alciatus*, of *Varro*, *Apuleius*, *Arruntius*, and *Pompeius*, affirming that after the second *Punic* war, the *denarius* contained *x asses*, the *quinarius*, or *victorialis* *v*, the *sestertius* *xx* and a half: We may give a true and easy solution, that these writers expressed the valuation of them, as they were in their first original and beginning, with reflection to their primitive denomination: In which respect the *treviri monetales*, or officers of the mint, usually imprinted on the *denarius* the character *x*, rather than *xvi*; the former being the impress of its first institution, and the latter of its after valuation. And so in like manner may those citations be answered by *Plutarch*, *Dionysius*, and others, produced by some learned men to strengthen their assertion, that the *denarius* after the second *Punic* war returned to its first estimation. Which thing could not have been effected, without extreme loss and prejudice to particular men, in their private fortunes and estates; which the justice and wisdom of the *Roman* senate, under the consuls, was not likely to have introduced, or the people to have admitted.

To conclude, the *denarius*, as it is evident by many irrefragable authorities before alledged, in the highest valuation passed for *xvi asses*; and according to that proportion, the *quinarius*, or *victorialis* for *viii*, the *sestertius* for *xx*: But in the lowest valuation, or first institution, it passed for *x asses*: And then the proportion of the *quinarius* was *v*, of the *sestertius* *xx* and a half, and therefore was thus marked *HS*, or thus *HS*, as the *quinarius* had this character *V*, and also this *X*, as it is to be seen in a *victorialis* of mine own (besides

several others) with the face and inscription of *M. Cato*. By which coin that place may not unfitly be explained, which troubled *Budæus*, why the *ordo decussatus*, and *ordo quincuncialis*, signify in the ranking of trees the same thing, altho' the *quinarius*, or *quincunx*, give the denomination to one, and the *denarius*, or *decussis*, to the other. The reason is, because the *quinarius* had the character *X* imprinted on it, as well as the *denarius*, or *decussis*. Besides in *Temperarius*, we find the *quincunx* to be thus represented, as the *uncia* thus — so that five of these *uncie* making the *quincunx*, and these five being ranged like the figure *X* (the character of the *decussis*) it is no wonder if the *ordo decussatus*, and *quincuncialis*, were taken for the same.

That the *denarius* should have passed at any other rate between *xvi* and *x asses*, as there is no coin extant to prove it, so there is no express authority to conclude it. Tho' some infer out of *Polybius*, that it was valued also at *xii asses*: Because he defines the *ἡμισάκιον*, or *semissis*, to be *ἑξακοντα μύρια δηνάρια*, the fourth part of the *Attick obolus*; and *vi oboli* being in the *drachma*, to which *drachma* they suppose the *denarius* equal, therefore there must be *xxiv semisses*, or *xii asses* in the *denarius*. But with much better reason we may hence infer, that the *drachma* was somewhat bigger than the *denarius*, as we shall prove in this ensuing discourse; and therefore *Polybius* allows *xii asses* to it: Whereas, if it had been precisely equal to the *denarius*, he would have valued it at *x*, or else *xvi* of the lesser sort of *asses*. So that sir *H. Savile*, a man of exquisite judgment and learning, in his discourse at the end of *Sacutus*, justly blames *Hottoman* for altering the text of *Polybius*, and is himself to be censured, as also *Lyffius*, in inferring thence that the *denarius* contained *xii asses*.

The several parts of the *denarius*, excepting the *quinarius* and *sestertius*, of both which I have spoken before, are all comprized in this description of *Varro*, with which I shall conclude: *Nammi denarii decima libella, quod libram pondo as valebat, et erat ex argente parva; sembella quod sit libellæ dimidium quod semis assis. Teruncius à tribus antiis sembella quod vale dimidium, et est quarta pars sicut quadrans assis*. By which proportions it appears, that the *libella* was the tenth part of the *denarius*, when it was current at *x asses*, the *sembella* the *xxth*, the *teruncius* the *xii<sup>th</sup>*. And thus much of the *denarius* as it is *nominus*.

GREAVES

The second, and our principal consideration of the *denarius*, is, as it is *pondus*, in which acception it will be necessary to premise a second distinction; that the *denarius* was either *confularis*, or *caesareus*. The *confularis* was that which was made under the government of the city by the consuls, the *caesareus* under the *Caesars*: The *confularis*, (I mean the *confularis* after the second *Punic* war, and under the later consuls) contained precisely the seventh part of the *Roman* ounce, as the other did the eighth part, or somewhat near it.

First that the *denarius confularis* of the later consuls, was the seventh part of the *Roman* ounce: This shall be our principal enquiry, because it is more evident of the two, and will give us the best light to discover the true weight of the *denarius*, in the notion and acception of the ancients, both *Greeks* and *Latins*. It is most apparent both by several fair coins which I have perused of the later consuls, as also by *Cornelius Celsus*, who lived in the beginning of the *Roman* emperors, before there happened a general diminution of the *denarius*, that it was then the seventh part of the ounce, who thus writes, *“ Sed & antea sciri volo in uncia pondus denariorum esse septem.* The same proportion is also exprest by *Scribonius Largus*, who lived not long after *Celsus*, as some imagine, his words are these: *Erit autem nota denarii unius pro Græca drachma; æquè enim in libra denarii octoginta quatuor apud nos, quot drachmæ apud Græcos incurrunt.* *“* *Pliny* also confirms the same. *Miscuit denario triumphator Antonius ferrum, alii* (he means under the emperors) *è pondere subtrahunt, cum sit justum octoginta quatuor è libris signari.* Out of which words of his, and of *Scribonius Largus*, it will by a necessary consequence be infer'd, that the true weight of the *denarius confularis* is the seventh part of an ounce. For if we multiply twelve, the number of the ounces in the *Roman* *libra* (as by all it is confess'd) by seven the number of the *denarii*, of which the ounce then consisted, the sum will be *xxxiii* *denarii*; and so many, say *Scribonius* and *Pliny*, ought justly to be in the *Roman* pound. And these are the only clear and positive authorities that are to be found in classical authors; most of the writings of the ancients, *de ponderibus* &

*mensuris*, having long since been lost; or else those few fragments that are left, of *Cleopatra*, *Dioscorides*, and of others, are so corrupted, that little truth with any certainty can be collected. From whence it will by way of corollary follow, that if either *denarius confularis* be given, the *Roman* ounce, and *libra*, in the same proportion will necessarily be thence deduced; or the *Roman* ounce, and *libra* be given, the *denarius* will as necessarily be concluded.

But before we farther treat of this argument, we shall endeavour also to demonstrate the *denarius*, by the *drachma Attica*. For *Scribonius* seems, and so do other ancients, to make them equal. And therefore *Pliny* writes: *“ Drachma Attica denarii argentei habet pondus: Whereas the drachma Ægina was much larger, this containing x such oboli as the Attick contained vi, and therefore the Athenians in hatred of the Ægenians, called it πικρὰν δραχμὴν, as Pollux testifies. And here as we considered the denarius, as nummus, and as pondus; so likewise must we take the drachma Attica, as nummus, and as pondus: In the prosecution of both which, relatively to the denarius, I shall insist so much the longer, because it is an argument that hath scarce at all, or very perfunctorily been handled. The drachma, as nummus, was a silver coin in use amongst the Athenians, (for I intend only to speak of the drachma Attica, for the same reason that *Pliny* doth, *“ Ferè enim Atticè observatione utuntur medici*) and so it was the measure of things vendible, as all coins are: And as *pondus*, so was it the measure of their gravity and weight. Now the *drachma*, as nummus, passed in the estimation of the best authors, both *Greek* and *Latin*, at the same rate and valuation as the *denarius* did. And therefore, as often as the *Latins* are to express the *Greek* *drachma*, they render it by the *denarius*; and on the contrary, the *Greeks* the *denarius* by the *drachma*. Thus what *Tully* renders by the *denarius*, *Dio* in his forty fifth book expresseth by the *drachma*. Their words, both speaking of *Augustus*, are these, *Veteranos quique Cassilini, & Calatie sunt* (as *Tully* relates) *perduxit ad suam sententiam, nec mirum, quingenos denarios dat.* Καὶ ἰδόντες ἰσχυρὸς τότε, saith *Dio*, κατὰ πικρὰν δραχμὴν. In like manner *Pliny**

<sup>a</sup> The *confularis* again may be considered, either in the time of the former, or of the latter consuls: That of the former consuls, at the first institution of it by *Q. Fabius*, five years before the first *Punic* war, *Peirecius* not improbably imagines to have been the sixth part of the *Roman* ounce: And *Agri-cola* by comparing it with the *talentum Atticum*, which *Varro* values at 15000 *Sesteritii* and with the *tetra-drachme*, which *Livy* (lib. 34.) estimates, *Trium fore denariorum*; as also upon the authority of the *Scholiast* of *Nicanor*, who equals the *denarius* to a drachme and an half, as *Priscian* doth to a drachme and a third part: I say, *Agri-cola* assigns it to almost the same proportion with *Peirecius*. But because I have seen no *denarii confulares* of so great antiquity, and these authorities may perchance admit other constructions, I shall leave this opinion as only probable, and follow what is more certain and demonstrative, of the later consuls.

writes,

writes, *Venisse murem ducentis nummis*, (that is, *denariis*; for *nummus* absolutely put is often, tho' not always, taken for the *denarius*, as on the contrary the *denarius* is taken for *nummus* in *Hefychius*, \* *δυναρεον τὸ νόμισμα, ἢ ἰσοδ' ἀργυρεον*.) *Casiliun ob-fidente Annibale, eumque qui venderat fame interisse, emptorem vixisse annales tradunt*. The same thing <sup>1</sup>*Valerius Maximus* reports in his seventh book, and sixth chapter, and <sup>2</sup>*Strabo* in his fifth book; the former writing that it was sold for 200 *denarii*, and the latter that it was bought for 200 *drachmae*. To these authorities I shall adjoin \* *Cleopatra*, τὸ Ἰταλὸν δυνάμεον ἔχει δραχμῶν δ. The Italian *denarius* containeth one *drachma*: And ° *A. Gellius*, *Lais μυρίας δραχμῶν ἢ τάλαντον ποσότη, hoc facit nummi nostratis, denarium decem milia*.

These two thus passing the one for the other, being also at the first institution much of the same fineness in respect of silver, it must necessarily be admitted, either that they were exactly the same for weight, which is our next enquiry, or else that they were not much different. For in comparing of foreign coins, the κολλυβιστοί, or *nummularii*, in ancient times, must have taken the same course, which our most knowing bankers do practise now. First, to respect the pureness and fineness of the coins, whether they be alike for the *intrinsic*; and next, whether they have the same weight; and if they differ in either, or both of these, according to those differences to proportion their exchanges. Those other accidental causes of the rising and falling of exchanges of moneys, since they are merely contingent, depending upon the necessities either of times, or places, or persons, I purposely pretermitt, as not so proper and essential to our enquiry. As for the *extrinsic* of coins, by which I mean the outward form, or character, and inscription of the prince, or state, tho' this may raise the valuation of them in those countries, which are subject to the prince, or state, and lessen them in those which are out of their dominions; yet this can produce no remarkable difference, more than what is usually assigned by the masters of the mint, for the waste in coining, and for the labour of the work.

With these cautions, if we shall examine the *Attick drachma*, and by such writings of the ancients, or by such coins as are extant, enquire their true weight, we shall come to such a preciseness as may be hoped for in a work of this nature. P *Suidas*

tells us in the general, *Δραχμή δ' ἑκατὶ νημιματὶ ἀρκεῖται*. The *drachma* is the weight of the silver money. And ° *Hefychius* more particularly informs us: *Δραχμή τὸ ὕδρον ἢ ὕψις*. The *drachma* is the eighth part of the ounce. And ° *Fannius* yet more distinctly writes:

*In scrupulis ternis drachmam, quo pondere doctis  
Argenti facili signatur pondus Athenis.*

To which we may add ° *Cleopatra*, ἡ δραχμή ἔχει γρημμάδα γ'. ἑκατὸς δ'. θυμῶν δ'. κροτία vi. χαλαρὸς μί. The *drachme* hath three scruples, six oboli, nine lupini, eighteen siliques, forty eight areola. The ° *Scholias* of *Nicander* also writes: as the *didrachma* to be τὸ τετραῖον ἢ ὕψις, The fourth part of the [Attick] ounce. In the same proportion are we to take those other silver *Athenian* coins mentioned by ° *Julius Pollux*, namely, the *tetradrachma*, which consisted of three *drachmes*, the *tridrachma*, or *tridrachma*, which by a syncope is the same with the *tridrachma*, containing four *drachmes*, or the half ounce. *Τετραδραχμον, τριδραχμον*, saith ° *Hefychius*; tho' ° *Ammonius* puts a distinction between them, *τετραδραχμον μὲν ὅ ἐστι τὸ νόμισμα, τριδραχμον δ' ἢ τετραδραχμον* [ἄξιον]. This the *Greeks* also called *σατὴ* as ° *Cleopatra*, and ° *Epiphanius* witness. ° *Ο σατῆς, in Cleopatra, ἂν κ' δ'. καλεῖται ἡ αὐτὴν τριδραχμον*: The *statēr* weighs four *drachms*, this they call the *tetra-drachme*. And this also may most clearly be collected out of ° *St. Matthew*, where seeing the original expresseth it more fully than our translation, I shall recite the words as they are in *Greek*: *Ἐλθόντων δ' αὐτῶν εἰς Καπερναῦν, προσήλθον εἰ τὰ διδραχμα λαμβάνοντες τὸ Πέτρον, καὶ ἔπον, ὃ διδάσκαλόν ἡμῶν ἢ τίλη τὰ διδραχμα*; which the vulgar renders thus: *Et cum venissent Capernaum, accesserunt qui didrachma accipiebant, ad Petrum, & dixerunt ei, Magister vester non solvit didrachma?* And our translation thus: *And when they were come to Capernaum, they that received tribute-money, came to Peter, and said, Dost not your master pay tribute?* In the twenty seventh verse of the same chapter, our Saviour answers: *Ἦνα μὴ σκανδαλίζωμεν αὐτοὺς, πορεύεσθαι εἰς τὸ θάλασσαν βάλε ἄλυστρον, καὶ ἢ ἀναβαίνοντα πρῶτον ἔλθω ἄρον, καὶ ἀνέλθας τὸ τέμα αὐτῷ ἀίρειται σατῆς. ἵναὸν λαβὼν δὲς αὐτοῖς ἀντὶ ἡμῶν ἢ οὐ. Notwithstanding, lest we should offend them, go thou to the sea, and cast an hook, and take up the fish that first cometh up: And*

*GRAVES* when thou hast opened his mouth, thou shalt find a piece of money: That take, and give unto them for me, and thee. This, which our translation calls *tribute-money*, in the twenty fourth verse, is called in the original *διδραχμῶν*, or *two drachmes*; and so much was paid by the pole, according to *Josephus*, for each particular person. Our Saviour therefore paying for himself, and St. Peter, in the twenty seventh verse, bids him to give a *stater*; that is, a *τετραδραχμῶν*, or four drachmes; namely the double to the *διδραχμῶν*, which our translation renders too generally by a *piece of money*: But the *Perisian* translation interprets it distinctly by four drachmes: *Thou shalt find four drachmes in it; that take, and give for thee, and me.*

With this *Attick tetradrachme*, or silver *stater*, the Hebrew and Samaritan *שֶׁקֶל* *Shekel*, that is, *Sicle*, did also agree. For if we give credit to *Josephus*, who in *Sealiger's* esteem is, *diligentissimus & philologissimus omnium scriptorum*, we shall find them to be the same. *Ὁ δὲ σίκλος τέμνεται ἰσούριον ἓξ, ἡμισία δὲ δίχεται δραχμὰς τρεῖς ἀγνῆς. The sicle is a sort of money amongst the Hebrews, that contains four Attick drachmes. The same proportion is evidently collected out of *Psalm*, where for 1 shekel mentioned in the law, he renders 200 drachmes, and for xxx an *ox*. *Hesychius* likewise testifies as much, *σίκλος τετραδραχμῶν ἡμισίον. The sicle is [in valuation] the Attick tetradrachme: And *St. Hierome* the ablest of the fathers in the Jewish antiquities, *Siclus, id est stater, habet quatuor drachmas Atticas.***

These testimonies are so positive, and from so good authors (to which also I might adjoin *Epiphanius* in his book *de sententia*, did I not conceive him to be full of errors in that discourse) that I cannot sufficiently wonder at that strange opinion

of *Græppius*, and some others, introduced out of affection of novelty, of a double shekel, the one sacred, equal to the tetradrachme, the other profane, weighing the didrachme: That used in the sanctuary, this in civil commerce, without any solid foundation in the writ, or without any probability of reason, that in any wise state, the prince and people should have one sort of coin, and the priests should have another: And that this of the sanctuary should be in a double proportion to the other, and yet that both should concur in the same name. It is true there is often mention in the scriptures of the weights of the sanctuary, not as if these were different from what were used vulgarly in the city; but because the standards, and originals, the rules of commutative justice, and therefore of an high and sacred use, were kept (as it is more probable) in the sanctuary; for God himself makes this one of the priest's offices, *ut sint super omne pondus atque mensuram.* And it is no wonder that God, who so much hated a false balance, and a false measure, should commit the charge of these to the priests, as things most holy; since the heathens themselves out of a reverent estimation of them, placed them in their temples, as appears by that inscription of the *congius* of *Vespasian* before alledged, and now extant in *Rome*, and by these verses of *Fannius*, treating of the *Roman* measures:

*Amphora sit cubus, quam, ne violare liceret.*

*Sacravere Jovi Tarpeio in monte Quirites.*

And afterwards in the times of Christianity, they were kept in churches, as it is to be seen in the *authenticks* of *Justinian*, where he commands that the weights and

<sup>c</sup> Josephus l. 7. Bell. Jud. c. 27.

<sup>d</sup> Scal. *emend.* in lib. de Emend. Temp.

<sup>e</sup> Hesychius in voce *σίκλος*.

were those *temenura æquiva*, the xxx pieces of silver, which were given to Judas, as the reward of his treason. *Eusebius* relating the story expressly, terms them *silver staters*, which an Hebrew would have termed either silver shekels, or absolutely *שֶׁקֶל* *Cesef*: This in scripture phrase being frequently put for the shekel, and therefore the Syriack translation of the new testament reads it *שֶׁקֶל*: Whence *Tremellius* hath this annotation: *Observeant Hebræi, ubicunque in scripturis argentorum fit mentio, non expressis numismatis argentei specie, intelligi solum sanctuarii æquivalentem quatuor denariis.* Some modern writers imagine them to have been but xxx denarii; but *Baronius* contends that they were, *vel librarum argenti xxx, vel aurorum coronatorum trecentorum.* And *Arias Montanus*, that they were either xxx libra, or xxx talenta. The most probable opinion is, that this sum was neither so great as *Baronius* and *Montanus* make it, nor yet so little as some moderns would have it, but between both, and that is xxx shekels. *M. Casaubonus* in his exertions upon *Baronius*, hath a probable conjecture to strengthen this assertion: *Non enim temere factum videtur, quod filius Dei qui sese examinavit, assumpti foret formæ, Phil. ii. 7. Tringita argentei venderetur, sicut lege Dei municipia totidem sicli assignantur.* Exod. xxi. 32. & apud *Josephum*, lib. 4. c. 8. *Facit hoc quædam non parum ad Domini abjectionem declarandam, quod caput ejus tam parvi æstinatum est.* A small price I confess, xxx shekels being less than 20 of our ordinary crowns. But *Hierome* upon St. Matthew thought it to be as little, who thus writes, *as M. Casaubonus* renders him, *Infelicem Judam non cogitasse quanti pretii rem venderet. Sed Christum mundi salvatorem, Dei filium, cui vile ali-quod municipium minimo pretio addidisset.* Now the price of a servant we find in *Exodus* to have been thirty shekels. <sup>f</sup> *Epiphanius* *supra* adducitur.

measures should be kept, in *sacratissima cu-  
jusvis civitatis ecclesia*. As for these al-  
legations taken out of the interpretation of  
the LXX, whereby *Gregorius*, and others, go  
about to prove a double shekel, they are  
well, and solidly, in my judgment, answered  
by *Villalpandus*, and others to whom I  
shall refer the judicious reader: For I in-  
tend not here to speak of the Hebrew she-  
kel, or *Attick* drachme, more than what  
may serve to illustrate the *denarius*.

Seeing therefore, as we have proved,  
that the *Attick drachma* was equal in the  
notion and acception of the ancients, to  
the *denarius*: If therefore an entire, either  
*Attick Δραχμή*, or *Διδραχμή*, or *Τετραδραχμή*,  
were found, we might thence conclude  
the *denarius*. Again, since the Hebrew she-  
kel hath likewise been demonstrated to be  
equal to the *Attick Τετραδραχμή*, and this  
*Attick Τετραδραχμή* to four *denarii*, by the  
common and received axiom of geome-  
tricians, we may conclude, that the He-  
brew shekel was also equal to four *denarii*;  
that is, that four Roman *denarii*, the *Attick*  
*Τετραδραχμή*, and the Hebrew *שקל* were  
all respectively equal to one another. If  
therefore an Hebrew shekel, fair and entire,  
were found, we might as necessarily thence  
infer the *denarius*, as by the *Τετραδραχμή*.

We shall endeavour by both these to  
enquire out the truth, and first by the *Attick*  
*tetradrachmes* in silver: Because of these I  
have seen and weighed many, some of  
them very fair and perfect, and found at  
many several places, as *Athens*, *Constanti-  
nople*, *Tenedos*, and other parts; where the  
art of counterfeiting coins is not as yet  
crept in, and where it is to little purpose  
to practise it: Seeing in those places there  
are few so curious as to buy them, or that  
will give a greater valuation than what they  
are worth in the *intrinsick*. Wherefore having  
in *Italy*, and elsewhere, perused many hun-  
dred *denarii consulares*, I find by a frequent  
and exact trial, the best of them to amount  
to LXX grains *English*, such as I have care-  
fully taken from the standards of the troy,  
or silver weights, kept in the tower in  
*London*, and in goldsmiths-hall, and in the  
university of *Oxford*: On the other side  
weighing many *Attick tetradrachmes*, with  
the image of *Pallas* on the forepart, and  
of the *noctua* on the reverse: I find the best  
of these to be CCXXVIII grains; that is,  
each particular drachme LXVII grains.

And that no man may doubt whether  
these were true *Athenian tetradrachmes*, we  
are to observe, that the ancients used fe-

veral impresses on their coins, by which <sup>GREAVES</sup>  
they might be known and distinguished.  
And therefore *argentum signatum*, in the de-  
scription of *Quintus* his triumph over *Pbi-  
lip*, is by *Livy* opposed to *argentum in-  
sectum*, which *Pollux* terms *δραχμή*, as *Tul-  
ly* calls the former sort, *Facillum atque sig-  
natum*, and the *Greeks*, *ἐπισφραγισμένον*. Thus  
the *denarius* had the impress of the *biga*,  
or *quadriga*, as *Pliny* informs us: And  
therefore *Livy* uses the word *bigati* for  
*denarii*, and *Pliny* both *bigati* and *quadri-  
gati*. The brass coins of the Romans were  
thus marked: *Nota aris fuit ex altera  
parte Janus geminus, ex altera rostrum navis,  
in triente vero & quadrante rates*. The  
*Persians* stamped on the reverse an *archer*:  
Which occasioned that conceit of *Agellus*,  
mentioned by *Plutarch*, That the king of  
*Persia* had beaten him back with ten thou-  
sand archers; when with so much money  
he had corrupted the *Greeks*. The *Car-  
thaginians* on the one side signed the face  
of a woman, (I suppose in memory of  
queen *Dido*) on the reverse the head of an  
horse, or in *Virgil's* expression, *Caput  
acris equi*, both which I have seen. The  
*Peloponnesians* had the impress of a tortoise  
on their money, whence that witty *Greek*  
proverb took its original: *ἡ τὰς ἀφίδας, ἡ  
τὰς ἐσφίρας ἐν αὐτῇ χαλκήρα*. The money at  
*Tenedos* had on the one side a double hat-  
cher, and on the other side two heads, one  
of a man, and another of a woman, arising  
from the same stem, or neck, in memory  
of a law made by the king of that island  
(whom *Heracles* names *Tirrus*, placing  
him antecedent than the *Trojan* war,) that  
a man and a woman, taken in adultery,  
should have their heads struck off with  
an hatchet. In which kind I met with  
two very rare and ancient coins in silver,  
at *Constantinople*, both made with a very  
fair relevy, and both agreeing in the same  
image and inscription; the one weighed  
less than the *Attick tetradrachme*, the other  
wanted somewhat of the *drachme*. And  
because the coin hath not, I think, been  
seen by any antiquary, and the history is  
remarkable, I shall here express the figure  
of the fairest of these.

<sup>a</sup> Villal. de appar. urbis ac templi, par. 2. lib. 2. disp. 4. c. 28. Item par. 2. l. 2. disp. 4.

assume what I said before) that the *Attick tetradrachme* is two hundred fifty eight grains, and the *drachme* is sixty seven of our *Troy*, or *English* standard. Which may farther be confirmed by an *Attick drachme* of mine own, found in the *Black Sea*, with this inscription, *ΑΘΕ ΤΙΝΑΡΝΙΚΑ ΑΡΧΗ*; and by a *τετράδραχμο*, or *semidrachme*, bought by me at *Alexandria*; that weighing near sixty six grains, and this thirty and better: the face of *Minerva*, either by use or time, being a little diminished in both; but yet so little, that they cannot have lost above two or three grains of their primitive weight. And as this single *Attick drachme* of mine is much to be valued by antiquaries for the weight, and therefore was desired by the learned *Pesirefrus*: So is the inscription, *ΤΙΝΑΡΝΙΚΑ ΑΡΧΗ*, no less worth consideration, for the explication of a place in *Plutarch*, who describing the naval triumph of *L. Aemilius*, writes thus: *Pecunia translata nequaquam tanta pro specie regii triumphi. Tetradrachma Attica cccxxxii milia. Cistophori cccxxii mil.* Where *Budæus*, and *Rhodiginus*, instead of *tetradrachma*, read *tetradrachma*. *Tetradrachm enim quid sit, nemo in arbitrio novit, fatis Budæus.* I would rather read it, as the coin doth, *Tinarnika*; this having almost the same letters with *tetradrachma*, which by the scribes, I suppose, have been inverted. Neither is there any reason, why *Plutarch* might not as well mention in this triumph, *Attica tinarnica*, as *tetradrachma*; these being the fourth part of the *tetradrachma*, and therefore better agreeing with his description: *Pecunia translata nequaquam tanta pro specie regii triumphi*: he here better agreeing with the *cistophori* he also mentions: a sort of coin about half of these *Attica tinarnica*, whereas the *tetradrachma* were eight times as great. For *Pestus* expressing the *talentum Euboicum*, renders it by 7500 *cistophori*, and by 4000 *denarii*; that is *cis tetradrachmes*. *Euboicum talentum nummo Græco septem milium Cingentorum cistophorum est: nostro quatuor milium denariorum.*

And as these testimonies above alledged are beyond all exceptions; so the gold coins of the Grecians, which I have examined, do most evidently prove this proportion assigned to the *Attick drachme*. Which that we may the better understand, we are to observe what proportion the valuation of the gold of those times had to the silver; and

next, what proportion it had in respect of GREASE weight.

For the first, *Julius Pollux*, in very peripatous terms, puts it down: Τὸ ἡ χρυσὸν οὐκ ἂν ἀφύκει διὰ τὰς ἀνάγκας τῆς ἐαυτοῦ τῆς ἐκ τῆς Μινυαίων ἀποκαταστάσεως μάτη. That the gold was in the tenfold proportion to the silver, one may evidently learn out of Menander's paracatasthece. \*The sabbotist of Aristotle's

ἱστορίας οὐ δαρκαίοι· ἰδιώται δ' ἵκανοι· αὐτοὶ, ὅπου ὁ ἀσπὴ τῶν Ἀττικῶν ὀνομαζομένη· χρυσὸν, ἡ δὲ δαρκαίου τῶν· ἑξὲς πάλαι· ἀλλ' αὖ' ἔτιγε τοῖς παλαιστοῖς βασιλεῦσι ἀποκαταστάσεως. Ἀλλοὶ δὲ τινες· διναρεῖς δ' ἄρκατοι· ἀφύκει δὲ ἀπονοῖ· εἰς τὴν πρὸς δαρκαίους διναρεῖς μὲν ἀφύκει. The daricks are golden staters, each of them is worth as much as that which is named by the Atticks the χρυσός. They are called so not from Darius the father of Xerxes, but from another king more ancient than he. Some say that the darick is valued at xx drachms of silver, so that v daricks are worth a mina of silver. For the Attick μῶν, or mina, containeth an hundred drachmes in weight, as it is very clear out of \*Pliny, \*Pollux, and others. *Menander* (faith *Pliny*) *quam supra minam vocant, pendit daricas Atticas centum.* And *Pollux*, τὴ μὲν δ' ἀπὸ Ἀθηναίων ἱκανὸν ἑξὲς χρυσῶν· Ἀττικῶν· The mina with the Athenians containeth an hundred Attick drachmes, and the χρυσὸν δαρκαίου, or ἑξήκοντα χρυσῶν of *Darius*, confiting of two drachmes in weight, as we shall presently prove, it will necessarily follow, that the proportion of the χρυσὸν χρυσία, was to the χρυσῶν ἀφύκει, in decupla ratione: and therefore, that five daricks, or ten drachmes of gold, were equal in valuation to an hundred drachmes in silver, that is, to the μῶν. The same proportion may be collected out of *Polybius*, when the *Romans* upon a sum of money to be received, concluded a peace with the *Ætolians*, Ἀπὸ τῆς τῆς μίσης τοῦ ἀφύκει χρυσία, χρυσίων ἰσὺν βύβασις διδόντες ἥ δίκαια μὲν ἀφύκει, χρυσία μὲν. Which words \*Livy renders thus: Pro argento si aurum dare mallet, dare convenit, dum pro argenteis decem aureis unus valeret. This being granted, as certainly of necessity it must, I would correct that place of \*Hesychius concerning the χρυσῶν χρυσία, and read it thus: χρυσῶν δ' χρυσία ὅλην νομισματικὴν εἰς ἀφύκει λήϊον δι' χρυσῶν ἰ, and not διδρυσῶν ἰ, as it is in the printed copies. And be-

\* I have since perused a fair *Athenian Treasury*, of my very worthy and learned friend, *John Marston*, Esq. weighing completely thirty three grains *Englsh*. As also another of *Mr Tho. Roe's*, together with an *Obole* of his, weighing eleven grains. † *Livius*, l. 37. ‡ *Bud.* l. 2. de ass. *Rhodigia*.

**GREAVES** this of Hefycbius I would supply the defect of <sup>b</sup> Suidas, who writes: Δραχμή ἢ ἄλλη νομισμα<sup>α</sup> εἰς ἀργυρεὺς δραχμὰς ἰ. and make it thus, Δραχμή ἢ χρυσὸς ἄλλη νομισμα<sup>α</sup> εἰς ἀργυρεὺς λόλον δραχμὰς ἰ. For without the addition of χρυσός, and λόλον, there is no sense: and I believe Suidas took these very words out of Hefycbius.

Having thus found the proportion that the δραχμή χρυσὸς had to the silver, our next enquiry is, how many of the drachmes in weight the χρυσός, or χρυσὸς σάληρ, or aureus contained. <sup>c</sup> Julius Pollux gives us in this particular the best, and most positive information of any, ὁ δὲ χρυσὸς σάληρ δύο ἑκατ. δραχμὰς Ἀττικὰς. The golden stater [or aureus,] contains two Attick drachmes. The fame is confirmed by <sup>d</sup> Hefycbius: Πολύμαρχος φησὶ διώσαδ<sup>α</sup> δὲ χρυσὸν σάληρ πέντε Ἀττικὰς δραχμὰς δύο. ἢ δὲ τοῦ χρυσὸς δραχμῶν νομισμα<sup>α</sup> ἀργυρεὺς δραχμὰς δέκα. Polemarchus says, that the aureus amongst the Athenians contains two drachmes, and that the drachme of gold is worth ten drachmes of silver. And to this of Pollux and Hefycbius, all the aurei of the ancient Grecians, which have passed through my hands, do very well correspond. Now these aurei, as they had several impresses upon them, so had they several names, by which they are distinguished. For they were either Ἀττικοί, or Δαρκενοί, or Φιλίππειοι, or Ἀλεξάνδρειοι, or the like; all which we may prove by Xenophon, <sup>e</sup> Harpocratio, the scholiast of Aristophanes, and others, to have been equal unto two Attick drachmes, and therefore respectively equal to one another. Neither is this much to be wondered at, that the Grecians and Persians, though at enmity amongst themselves, yet should agree in the aurei; seeing that in our times the Venetian cbequeen, the Barbary ducat, the Egyptian and Turkish sberif, are almost all of the same pureness in respect of the gold, and not differing above a grain in the weight. Which difference we may also allow to those of the ancients, without any prejudice to our enquiry. Concerning these aurei, or golden staters, the observation of <sup>f</sup> Julius Pollux is worth our consideration: Καὶ οἱ μὲν Δαρκενοὶ ἑκατὸν σάληρας, οἱ δὲ Φιλίππειοι οἱ δὲ Ἀλεξάνδρειοι, χρυσὸς πέντε ὄντες, ἢ οἱ μὲν χρυσὸς ἑκατὸς πρῶτος (ἢ σάληρ, ἢ δὲ σάληρ ἑκατὸς ἢ πέντε ὁ χρυσός). Of the staters some were denominated from Darius, some from Philip, some from Alexander, and were all of gold. And when you say the aureus, the stater is understood, but if you say the stater, the aureus

is not always meant. And this is most true; for the χρυσός, or aureus, (I speak not here of the aureus Romanus, this being somewhat less than these mentioned by Pollux) did always imply the σάληρ, but the σάληρ did not always infer the aureus: the stater being more general, signifying as well the argenteus, as the aureus, and that was double to this; the stater argenteus being four drachmes, as we proved before, and therefore the same with the tetradrachme, and the aureus two drachmes, and therefore equal in weight to the didrachme. Wherefore every aureus was rightly called a stater, but every stater could not rightly be called an aureus.

From these aurei then, or χρυσὸς σάληρας, we may deduce the silver Attick drachme, if we either had the Δαρκενοί, some of which to this day are found in Persia, or if we had the Φιλίππειοι, or the Ἀλεξάνδρειοι. To pass by the Δαρκενοί, because I have not perused any of them, and to speak only of the Φιλίππειοι and Ἀλεξάνδρειοι, of which there are many extant.

Concerning the Φιλίππειοι <sup>g</sup> Snellius writes thus: Philippi nummum unicum, & Alexandri Macedonum, solertissimus veterum nummorum aestimator Nicolaus Rockoxius possidet, utrumque eodem pondere granorum 179. Now CLXXXIX grains of gold in Holland, such as Snellius used, are answerable to an hundred thirty four grains English and an half. Near which proportion I have observed two others, with the inscription ΦΙΛΙΠΠΟΤ, excepting only a grain or two.

As for the Ἀλεξάνδρειοι, I find the weight of one of the fairest for impresson, and character, I think, in the world, which I bought at Alexandria, with the image and inscription ΑΛΕΞΑΝΔΡΟΤ, to be exactly of English grains 133  $\frac{1}{2}$ , and another at Constantinople 133, and in the same proportion several others. With which comparing one of mine honoured and learned friend, John Marsham, Esq; I find his a grain defective: and weighing since some others, out of that choice and rare κομῆλιον of ancient coins, collected by the noble sir Simonds D'Ewes, knight baronet, I observed two of his to exceed 133 grains by half a grain.

Wherefore I may conclude (allowing only half a grain for so much wanting by time, or by the mint) from the aureus being double to the Attick drachme, that it hath been rightly assigned by me to be LXXVII grains: and from this with those limitations above mentioned, I may conclude the denarius consularis (which is our princi-

pal enquiry) seeing <sup>a</sup> Galen, l. 8. c. 3. de compositione medicam. According to the Latin manner of division, speaking of an antidote prescribed by *Aclepiades*, whereof the *dosis* was to be one drachme, or denarius, writes thus: Ἡγύμαιο δ' λίγων αὐτὸν δραχμῶν ἀρίστων, ἃ ἴσ' ὅτι χρὸν ἅπασιν τοῖς νοσήτοις ἰατροῖς ἰδοῖν ἐνομάσαν. ἄλλο δ' νοῖν ἡμᾶς ἰδὲν ἢ τῷ πρὸς γυμνασίῳ φῦσι ἀναίσχυντα. περιέχον δ' ὅτι δραχμῶν λιγυρῶν νῦν οὐα τοῖς τοῖσιν αἰσῶντες, ὅπερ Ῥωμαῖοι θηνάριον ἐνομάζουσιν. I suppose, that be means the silver drachme, for so all the later physicians are wont to call it; neither will the nature of the thing suffer us to understand any other. And it is manifest, that in such things as we all now name the drachme, the Romans name the denarius.

The denarius also, as we proved before out of *Philo*, *Josephus*, *St. Hierom*, and *Hesychius*, may be inferred by the Hebrew or Samaritan shekel: the shekel, by the joint testimony of all of them, being equal in valuation to the Attick stater Argenteus, or tetradrachme, and the Attick tetradrachme, as we have shewed, to four denarii consularis: If therefore an Hebrew or Samaritan shekel in silver, fair, and not impaired, were found, we might by this as well discover the denarius, as by the tetradrachme, or the aureus. And here I must confess I have not seen so many perfect and entire, with the Samaritan characters, which certainly are the best and truest, (for those with the later characters, invented, as some suppose, by *Esdras*, are most of them counterfeit, as to give my self satisfaction. For tho' I have perused that of *Arias Montanus*, now in the university of Oxford, which he describes in his tract *De Siculo*, and from whence he deduces the proportion of the Hebrew shekel; yet to speak the truth, there is no trust to be given to it: Not but that the coin is very ancient, and the inscription upon it in Samaritan characters well made; but the sides of it have been so filed away, that it hath very much lost of the true weight: For I find it to be scarce the weight of twenty-pence of our English standard. Whereas *Montanus*, if he made his observation exactly, equals it to almost four Spanish rials, or to four Roman julio's; both which exceed two of our English shillings. So that till such time as I may procure out of the east, (whither I have often sent) some perfect shekels, I must be content to take up the relations of others. And here I shall begin with *Moses Nebemani Gerundensis*, a jew, a learned expofitor of the *Pentateuch*; who, as *Arias Montanus* tells

us, flourished in Catalonia above 400 years since. His words, as *Montanus* hath delivered them in his tract *de siculo*, are these: <sup>1</sup> In comment. Exod. xxxix. Multis verbis differens significabas se non facile ad Salomonis Jarrhai, qui ante illum in Gallia scripserat, sententiam de siculo accedere; cum Salomon affirmasset, Siclum esse dimidium argenti unciam. Postea jam absoluto in omnem legem commentariorum opere, idem Moses Gerundensis capite ad eam rem propriè addito, sicali æstimationem à Salomone illo indicatam, re ipsà doctus, ingenuè, & apertè, ut viros doctos, & veri irruendi, atque docendi cupidus decet, comprobavit. Narrat autem se eo anno, quo illa scriberet, in Palestinam ex Hispaniâ sacrorum locorum visiendi causa novi delatum Acconam, quam nunc Jacoban vocant, devenisse; ibidemque sibi ab incolis ostensum fuisse nummum argenteum antiquissimum, expressis tamen signis & literis conspicium; in cujus altero latere forma esset vasculi illius, quod manna plenum in sacra arca ad seculorum monumentum, Dei jussu, & Moses procuratore fuerat repositum: Et in altero ramus ille admirabilis, quem in fasciculum virgularum plurimarum Aaronis nomine illatum (cum illius sacerdotali dignitati ab æmulis quibusdam obtrectaretur) postera die populus omnis florentem, amygdalæque explicantem vidit; inscriptiones etiam fuisse in eodem nummo Samaritanis characteribus, quæ olim communes totius Israelis literæ fuerant, ante discessionem decem tribuum à duabus, lingua sãdã Hebraica, quarum exemplum ex altera parte erat SEKEL ISRAEL, quod Latine sonat sicles Israelis: Ex altera vero JERUSALEM KEDESSAH, hoc est Jerusalem sancta: Qui nummus antiquitatem cum primis magnam probabat, ut; ole cuius nomine Israelis, eo tempore quo omnes xii tribus communi concordia Israelis nomen obtinebant; quoque Hierosolyma ipsi omnibus regia urbs, sancta quoque erat; eademque communis omnibus & religionis, & publicæ rei, & monetæ, atque literarum ratio, quæ postea discessione facta, alia atque alia utrique parti fuit. Namque Judæi, ut omnes fere scriptores asserunt, ne cum schismaticis Israelitis ullo sacrorum usu communicarent, eam literarum formam, quæ nunc etiam in usu est, hoc est quadratam, mutatis valde alteris: prioris figuris, adinvenere. Affirmat prætere, idem Gerundensis, nummum illum, qui sicli: inscribatur, sibi in statum pensum dimidiæ argenti uncie pondus reddidisse, ostensam quoque alteram monetam dimidiato pondere minorem, iisdem omnino vasis & ramis figuris quæ tamen non SEKEL, sed HASZI SEKEL, hoc est dimidius sicles diceretur, probare itaq; sibi vel maxime Salomonis Jarrhai de sicli pondere, & valore, sententiam. Thus

<sup>1</sup> Arias Montanus de Siculo, in libro qui inscribitur

GRAEVES for *Gerundenfis*: who if he had exprest with what half ounce he had compared his shekel, or if *Montanus* had done it for him, they had given the judicious reader better satisfaction. But this, I suppose, by a probable conjecture, may be supplied, in saying, that he living in *Catalonia*, weighed it with the *Catalonian*, or *Spanish* half ounce; which <sup>k</sup> *Villalpandus*, and <sup>l</sup> *Claconius*, both of them *Spaniards*, make equal to the half ounce now used at *Rome*; that is, to two shillings three pence farthing, *q.* of our money. This conjecture of mine will exceeding well confirm those many observations of *Villalpandus*, a man in this kind very curious, which he made of several ancient shekels in silver, who thus writes: <sup>m</sup> *Igitur ante aliquot annos appendimus siculum unum apud F. Ursinum & postmodum eos omnes, quos præcedenti capite percensuimus, atque conperimus singulos argenti sículos ex æquo semuncie Romanæ antiquæ respondere; ita ut ne minimum quidem bordei aut frumenti granulum, buic, vel illi lanci addi potuerit, quin in eam examen propenderet. Nec mirum cuiquam videri debet, antiquissimos nummos suo pristino ponderi nunc respondere, neque ullam argenti partem vetustate consumptam tot sæculis fuisse. Nam singulari Dei beneficio nobis contigit, tot integros appendere potuisse sículos. Id quod nummi ipsi integri vetustatem maxime præ se ferentes, literæ expresse, exstantisque, argenti color, atque alia id genus multa facile probant.* With these observations of *Villalpandus*, I find the weight of a very fair *Samaritan* shekel, of the truly noble and learned Mr. Selden, to agree: To whom I stand obliged for this favour as he doth for the coin, to the honourable antiquary, Sir Robert Cotton. To these testimonies, tho' (it may be) sufficient of themselves, I shall add <sup>n</sup> one more, for farther illustration of the weight of the *Hebrew*, or *Samaritan* shekel, and that is of an ancient, and fair one, in silver, amongst his majesty's coins, perused by the most reverend primate of Ireland, a man of exquisite learning and judgment, who hath often assured me, that it weighs two shillings five pence of the *English* standard; which proportion, excepting some few grains, in which it doth exceed, does well correspond with those of *Villalpandus*. And this may farther be confirmed out of the *Talmud*, כל כסף האמורה בתורה כסף צורי ושל רבו הכסף מדינה *Argentum omne cuius in lege fit mentio, intelligitur argentum Tyrium (ponderis & bonitatis ut in urbe Tyri: As*

<sup>p</sup> *Schlinder* interprets it) sed *Rabbinorum argentum intelligitur argentum commune provinciale*. Taking therefore the silver money of *Judea*, as the *Talmud* doth, to be equal to the *Tyrian*, and that of *Carthage* to be equal to that of *Tyre*: As it is very probable that the *Carthaginians*, being a plantation of the *Tyrians*, might observe their proportions in coins, as well as their customs in religion, we may by these discover the shekel to be much about the same weight that hath been assigned: For <sup>q</sup> *Ant. Augustinus*, describing in his dialogues the weight of two fair *Carthaginian* coins in silver, writes, that they are each of them somewhat more than four drachms: that is, as he elsewhere explains himself, a little more than half the *Roman* ounce. If therefore we shall adhere to the observation of *Gerundenfis*, made four hundred years since, or to these later of *Villalpandus*, and others; or to this conjecture of mine, the *Hebrew* shekel, and half the present *Roman* ounce, are either both the same, or else very near in proportion.

And this may easily be granted; but if it be, how will four denarii consulares, four *Attick* drachmes, and the *Hebrew* shekel, be reciprocally equal one to another, as they should be by those several testimonies before alledged? Whereas, by many hundred denarii consulares, tried by an exact ballance, I find the best of these to contain *LXII* grains *English*, and the *Attick* drachme *LXVII*. And the fourth part of the shekel to be but *LVI* grains <sup>2</sup>, if we admit of *Gerundenfis*, and *Villalpandus*'s observations. Which notwithstanding, according to *Philo*, *Josephus*, *St. Hierom*, *Epiphanius*, and *Hesychius*, should be equal to the *Attick* drachme; and the *Attick* drachme, by the testimonies of the ancients, should be likewise equal to the *denarius*. For the solution of this objection I answer: First, That the *denarius*, and *Attick* drachme, being distinct coins of different states, and not much unequal in the true weight, it is no wonder, especially in *Italy*, and in the *Roman* dominions, that they should pass one for another: no more than that the *Spanish* rials, in our sea-towns in *England*, should pass for testars; or the quarters of the dollar be exchanged for our shillings: whereas the *ric'* in the intrinsic valuation, is better than our testar by four grains, and somewhat more; and the quarter of the dollar is better than our shilling by more than eight grains, or a penny; but because they

want the valuation; character, and im-  
pression of our princes, which I call the ex-  
trinsic of coins, therefore doth the Spanish  
money fall from its true value with us,  
and so would ours do in Spain. By the  
same analogy must we conceive the Attick  
drachmes, tho' in the intrinsic they were  
somewhat better worth than the denarius,  
yet for want of the extrinsic, to have  
lost in Italy, and thereby to have become  
equal in valuation to the denarius. And  
this seems to be implied by \* Volusius Ma-  
tianus: *Victoriatas enim nunc tantundem va-  
let, quantum quinarium olim. At peregrinus  
nummus loco mercis, ut nunc tetradrachmum,  
& drachma habebatur.* Which words of  
his *loco mercis*, plainly shew they made some  
gain of the tetradrachmum, and drachma:  
As our merchants, and goldsmiths do of  
the Spanish rials, and quarters of a dollar.  
Which they could not do, if they were  
precisely equal, but must rather be losers  
in the melting or new coining of them.  
And therefore all \* modern writers that  
have treated of this argument, some of  
them making the drachma less than the de-  
narius, others equal, but none greater,  
have been deceived by a double paralogism,  
in standing too nicely upon the bare words  
of the ancients, without carefully examin-  
ing the things themselves. First, In making  
the denarius, and Attick drachme precisely  
equal, because all ancient authors generally  
express the Attick drachme by the denarius,  
or the denarius by the drachme; either be-  
cause in ordinary commerce, and in vulgar  
estimation, they passed one for another, in  
the Roman state; or else if any were so  
curious to observe their difference, as surely  
the ΚΑΛΥΨΙΣΑΙ were, yet by reason of their  
nearness, and to avoid fractions, and hav-  
ing no other names of coins that were  
precisely equal, whereby to render them,  
therefore all Greek and Latin authors, mu-  
tually used one for the other. And, secondly,  
Because some writers, (as Diofcorides and  
Cleopatra) affirm, that the Roman ounce  
contained eight drachmes, therefore modern  
authors infer, that the denarius, being equal  
to the drachme, and eight drachmes being  
in the Roman ounce (as so many were in  
the Attick) that therefore there are eight de-

narii in the Roman, and consequently that  
the Roman and Attick ounces are equal.  
Whereas Celsus, Cribonius Largus, and Pliny,  
as we shewed before, expressly write, that  
the Roman ounce contained in their time,  
which was after Diofcorides, seven denarii.  
And being natural Romans, and purposely  
mentioning the proportion of the denarius  
to the ounce, thereby the better to regulate  
their doses in physick, it is not probable  
but they must better have known it than  
the Grecians. Besides, who with any cer-  
tainty can collect out of these imperfect  
fragments of Diofcorides and Cleopatra (for  
those tracts of theirs, *de ponderibus* are no  
better) whether at the first they wrote in  
that manner, as they are now printed? Or  
if they did, why might not they endeavour  
to introduce into the Roman ounce, in  
imitation of the Attick, that manner of  
division, which is now generally received  
in our times, of making the ounce, of  
what kind soever it be, to contain eight  
drachmes. And surely this of eight being a  
compound number, as arithmeticians use to  
speak, was much fitter than seven, used by  
the Romans, which being a prime number,  
is therefore incapable of any other division.  
And then for to conclude, that because the  
Attick ounce had eight drachmes, and the  
Roman as many, that therefore their oun-  
ces are equal, is all one as to conclude,  
that the Paris and English ounces are  
equal, because the French as well as we  
(and so do all physicians of all countries  
that I know) divide their ounce by eight  
drachmes. And thus, I suppose, I have  
sufficiently answered the first part of the  
objection, concerning the denarius, and  
the Attick drachme: that if we respect the  
vulgar and popular estimation, in which  
sense classical authors understood them (for  
they could not well otherwise render them,  
than as they were current) so were they  
equal; but if we respect the intrinsic val-  
uation, which depends upon the weight,  
especially when coins are of a like fineness,  
so were they unequal: the Attick drachme  
being, of our money, eight pence farthing  
q. and the denarius consularis seven pence  
half-penny farthing; allowing for the stan-  
dard \* viii English grains to the silver penny.

\* Vol. Matianus de assis distributione. These words of Matianus I find in a MS of Temporarius, thus cor-  
rected: *Victoriatas enim nunc tantundem valet quantum quinarium. Olim ut peregrinus nummus loco mercis,  
ut nunc tetradrachmum, & drachma habebatur.* Whether it be by conjecture, or that he found it in some  
ancient MS. I know not, but the emendation I cannot but approve.

\* Budeus drachmam putat ejusdem ponderis esse cum denario: Onuphrius vero inter utrumque statuit ratio-  
nem sesquialteram, Agricolae sesquiseptimam, ut Porcinius tres denarii quatuor drachmas, Agricolae vero septem  
denarii octo drachmas efficiant. Capel de pond. & nummis, l. 1. lxxxiv denarii, quae est libra Romana, sunt  
aequales xxvi drachmis, quae est libra Italica, & medica. Scal. de re nummaria.

\* These proportions, with those before, and those which follow, are taken from the English standard at  
five shillings the ounce (as it was formerly coined) to avoid fractions: that is, eight grains to the silver penny:  
whereas in these times it is five shillings, two pence. Not that the ounce is encreased, for this is always con-  
stant and fixed; but that for reasons of state, our silver coins are diminished, and consequently contain fewer  
grains. And this diminution must necessarily be, as often as other nations, with whom we have commerce,  
rebat in the proportions of their coins; or else we must be content to be losers.

GREAVES

Neither do I know any authority, that either expressly, or by a true and logical consequence, can be produced out of classical authors, to infringe this assertion of mine, unless it be one in *Fannius*, which being a fragment is the less to be valued: and another in *Livy*, who thus writes, lib. XXXIV. in his description of the triumph of *Quintius*: *signati argenti octoginta quatuor milia fuere Atticorum, tetradrachmum vocant, trium fere denariorum in singulis argenti est pondus*. Which words of his occasioned *Georgius Agricola*, not knowing how to answer them, to bring in a distinction of three sorts of *denarii*: the *gravis* weighing an *Attic drachme* and an half, the *mediocris* one and a seventh part, the *levis* most commonly one; without any clear proof or evidence in any ancient author, and directly contrary to all ancient coins of the *Atticks* and *Romans* which I have seen: of which error he would not have been guilty (for there is no man that hath writ either *de ponderibus* & *mensuris*, or *de re metallica*, more solidly and judiciously than he) if he had been so happy as to have perused many entire *Grecian aurei* and *tetradrachmes*, or else to have examin'd a greater and more select quantity of *Roman* coins. To satisfy my self concerning that place of *Livy*, I had recourse to our MSS. here (and I could wish I had done the like in *Italy*) and these I find to agree with the printed copies; tho' the coins, which are much ancients than any MSS. constantly disagree. Wherefore if it be not a mistake in *Livy* himself, which I am not apt to believe in so grave an author, I would correct the copies by the coins, and instead of *111 fere denariorum*, make it thus, *1v fere denariorum*. Where the figure *v* being resolved into two lines, and left a little open at the bottom, might easily be taken by the scribe for the figure *11*. And this I do certainly believe is the true ground of that error, wherewith so many of late hath been perplexed. However it were, it is as ancient as *Priscian*, or *Pseudo-Priscian* (as *Capellus* styles him) who, in his tract *De ponderibus*, reads those words of *Livy* in the same manner, *Trium fere denariorum*.

As for the *denarius aureus*, a name I think not known to the ancients, which *Salmasius* and others collect out of *Livy*, *De sœdere Ætolicæ*. *Pro argento si aurum dare mallent, dare convenit, dum pro argen-*

*teis decem aureus unus valeret*. I see no solid foundation for that opinion; all that can be collected thence is, that the gold then was in *decupla ratione* to the silver, which I have proved before. And whereas *Plautus* hath his *denaria Philippiæ*,

*Nummi octingenti aurei in marsupio infuerunt, Præterea centum denaria Philippiæ*.

This is a metaphorical or comical expression of him, and no certain sort of coin; which he pleasantly calls *denarii*, because half the *χρυσοὶ Φιλίππειοι* were equal in weight to the *drachma*, and so also was the *Roman denarius* supposed to be.

Nor are we to take the *κλῶσ*, which is thrice mentioned by *St. Matthew*, and once by *St. Mark*, for the *denarius*, as some have done: no, nor for any other sort of coin: for it is precisely the *Latin* word *cenfus*; that is, *ὁ φόρος*, *tributum*, and so it is rendered by *St. Luke*, *ἡ ἐστὶν Καίσαρος φόρος δῶνα*, *ἡ ὡς*; where *St. Matthew* and *St. Mark* have it, *ἡ ἐστὶ δῶνα κλῶσος Καίσαρος ἡ ὡς*; tho' *Hefychius* and *Moscopulus*, both upon an error, interpret it a sort of coin. *Hefychius*, *κλῶσος* *ἄνθος νομισμα*, or *νομισμα* *ἄνθος*, as *M. Casaubone* corrects it: and *Moscopulus*, *κλῶσος* *νόμισμα* *δεσποτικῆς ἰσχυράς*, the *cenfus* is a coin equal in weight to the *drachme*: that is, in the notion of the *Greeks*, equal to the *denarius*. The error of these two *Greek* grammarians, is a misunderstanding the propriety of the *Latin* word *cenfus*: and that occasioned them to take *κλῶσος*, and *νόμισμα* *τὸ κλῶσος*, for the same. But the evangelist *Matthew* puts a manifest difference between *κλῶσος* *tributum*, and *νόμισμα*, the money that was paid for tribute. *Ἐπίδειξις μοι τὸ νόμισμα τὸ κλῶσος*, writes *St. Matthew*, *Shew me the money of the tribute*: or as our new translation renders it, *Shew me the tribute-money*. And the three evangelists, *Matthew*, *Mark*, and *Luke*, immediately after expressly term this money the *δωδεκά*. *οἱ δὲ προσένεκον αὐτῷ δωδεκά*: and they brought unto him a penny. Which being a *Roman* coin, and current amongst the *Jews*, being then in subjection to the *Romans*, it is more than probable that they paid their tribute to *Cæsar*, in the same species of money that was used by *Cæsar*; and not with any new or peculiar sort of coin, according to *Baronius* (which *M. Casaubone* hath justly

\* *G. Agricola* responso ad *Alciatum* de pond. & mensuris. *Argentii Romanorum denarii triplices sunt: Græci, qui pendunt drachmam Atticam cum dimidia: Mediores, qui drachmam & septimam ejus partem: Leves, qui plerumque drachmam.*

† If this answer be not satisfactory, we may say, as some have done, that *Livy*, *Fannius*, and the *scholiast* of *Nicanor*, speak of the *denarii* of the former consuls immediately succeeding *Q. Fabius*. For there being but six of those in the ounce, (as they suppose) the *denarius* will be greater than the *drachma*, as it will be less when seven were coined, under the later consuls, which is our assertion.

‡ *Livius*, l. 38.

§ *Plautus* in *Rudente*.

confuted) but with the ordinary current money of Rome, and that was the *denarius*.

Our next solution should be of the *shekel*. how it could be equal to the *tetradrachme*, and consequently to four *denarii*, when by the constant weight of the best Hebrew, or Samaritan *shekels* extant, we find them to be much less. And here I am a little unsatisfied, how to reconcile the coins to *Philo*, *Josephus*, *Epiphanius*, *St. Hierom*, and *Hefsebius*: or else, if we admit of the coins (as I know no just exceptions against them) how to excuse these authors of too supine negligence in comparing them, if so be they ever were so curious as to collate them with the *Attick tetradrachmes*. For if we shall say, that the silver *stater*, or *Attick tetradrachme* was a foreign coin, in respect of the rep. of the *Jews*, and therefore that in *Judea* it might somewhat fall from its true valuation, we shall say no more than what reason and experience confirm. But then that the *tetradrachme* should sink so low as to lose four-pence-half-penny, if we take the reverend *primate's* observation before-mentioned; or which is more, six-pence *q.* if we follow that of *Gerundenfis* and *Villaspandus*, or those of mine, upon two shillings nine pence half-penny, for so much was the *tetradrachme* of our money, it may seem too great a diminution; especially the *Attick* money being as pure, and fine, as that of the *shekel*; and therefore no goldsmith amongst the *Jews*, but would have given a greater rate only to melt it, and turn it into bullion. Yet on the other side, when I consider the practice of the money-changers amongst the *Jews* at this day, which it may be was as bad in *Philo's* and *Josephus's* time, and might occasion our Saviour not long before to whip them out of the temple, *which they by their extortions had made a den of thieves*; who now make it a trade at *Alexandria*, and elsewhere, in changing *Spanish* dollars into *madines*, (or the small silver money current in *Egypt*) to gain one or two *madines* upon every dollar, notwithstanding the *Spanish* money is as frequent, and as well known in *Turky*, as their own. I can the better imagine they might make the same advantage, or a little more, upon the *Attick tetradrachmes*: Which it may be also were not permitted, being contrary to their law, to pass so generally with them, as the *Spanish* money now doth (by reason of the image of *Pallas*, and the *Noëtia* instamped:) or if they were permitted, yet they might not be so common, and so well known: and therefore upon strangers in *Judea*, in giving them current money for that which was foreign, they would gain so much the more. So that *Philo*, and *Josephus*, when

they equal the *shekel* to the *tetradrachme*, <sup>GERRAVER</sup> may have taken it upon the relation and practice of these money-changers, and not upon any experiment of their own. The same answer may serve for *Epiphanius*, *St. Hierom*, and *Hefsebius*: tho' it may be these borrowed their descriptions from *Philo* or *Josephus*, who long preceded them: and being *Jews*, and living in the time when the state of the *Jews* was in being; whereas these did not, their authority is the more to be credited. And thus have we finished our enquiry of the *denarius consularis*, by comparing it with the *Attick drachmes*, and the Hebrew *shekels*.

ON CONGH VESPASIANI IN PALATIO  
FARNESIANO ROMÆ.

\* At my being in *Egypt*, thirty five *madines* passed for a dollar: *Sand's* in his travels writes forty.

GREAVES

The last and best way to discover the true weight of it, is by the *congius Romanus*, whereof by a special providence, as *Pætus*, and *Villalpandus*, have well observed, the original standard of *Vespasian* is still extant in *Rome*. This, as the superscription upon it, *XP* demonstrates, contains the weight of ten *Roman pounds*, and is equal (by the joint confession of all authors treating this argument) to six *sextarii*. Again, the *sextarius*, as *Galen* writes, ἔχει μίαν λίτραν ἢ ἡμίσητον ἢ ἑκτον, ὡς αἶμα τὰς πέντε ὑγίας κ'. Contains one pound and an half, and a sixth part, so that it bath in all twenty ounces. Or as *Oribasius*, physician to *Julian* the apostate, informs us, is equal to the *Roman pound*, and eight ounces. Ἰταλικὸν μέγεθος ἔχει ἕξας μκ'. ἕξας λίτρας μίαν, ἢ ὑγίας η'. The Italian amphora contains forty eight *sextarii*, and the *sextarius* one pound and eight ounces. The capacity therefore of this *congius* being fill'd up with six *sextarii*, of some certain sort of liquors, (for it is *liquorum mensura*) will give us ten *Roman pounds*, and consequently their ounces and *denarii*. The only difficulty is, with what sort of liquor we must measure it: for all liquors are not of the same gravity. And this is well cleared by *Rhemnius Fannius*, and others.

*Illud præterea tecum cōbiberē memento,  
Finitum pondus variis servare liquores.  
Nam libra, ut memorant, bessem sextarius  
addet,  
Sed puras pendas latices, seu dona Lyæi.*

The *sextarius*, saith *Fannius*, contains one pound and eight ounces, whether we weigh clear water, or wine: where by wine, according to *Agricola*, is to be understood, *vinum subum*, such as the *Greeks* call *κυσσόν*. Rather, I imagine, that wine, which *Galen* calls *λευκόν*, ἢ ἐνδοφύον. The *sextarius* then being one pound eight ounces of clear water, or pure wine, and six *sextarii* being in the *congius*, it is most evident that the *congius* contains ten pounds of water, or of wine. This also appears by a plebiscitum of the two *Silii*, *Publius*, and *Marius*, which is to be seen in the best copies of *Sextus Pompeius*.

The same is confirmed by *Dioscorides* i who for farther certainty, mentions with what sort of water we should measure it: and that is with rain-water, which he makes to be the most infallible of all: Ὁ χυρὸς τάλις τὸ κύβητον ἔχει λί. ι. τὸ ἡμικύβητον ἔχει λί. κ. ὁ ἕξας ἔχει λίτρας μίαν γα. η, δέκ. ὁ αὐτὸς δὲ σαβύς ἑστὶ ἢ ὕδατος ἢ ἕξας. φασὶ δὲ τὸ ἡμίβητον ὕδατος παντοῦθεν ἀψιδιδαμένων ὄναι τὸ σαβύον, αἶμα δὲ ὁ καὶ ψα τὸ αὐτὸ. The chus, (that is, the *congius*), contains ten pounds; the semicongius five; the *sextarius* one pound and eight ounces, &c. The weight of water, and of vinegar is the same. They say, that if it be filled up with rain-water, the weight will be most certain. The *congius* weighs seven hundred and twenty drachmes. An anonymous Greek author, falsely reputed to be *Galen*, in the edition at *Venice*, confirms the same, Πασεὶ δὲ τῷ ἰταλικῷ μέγεθος) ὁ χυρὸς μέγεθος μίαν ἔχει ξ. καὶ ὕμους ἑβ. σαβύον δὲ ὕδατος ἡμικύβητον, ὅπως ἑστὶν ἀψιδιδαμένων, δεκα-

<sup>9</sup> Fragmenta Dioscoridia.

The proportion that rain-water hath to fountain-water, is as 1000000 to 997522, and the proportion that it hath to water distilled, is as 1000000 to 997065; as it hath been observed by *Snellius* in *Eratosth.* Bat. l. 2. c. 5. Est in æquali mole ratio aquæ pluvie ad distillatam, quemadmodum 1000000 ad 997065; pluvie autem ad putealem ut 1000000 ad 1007522.

This authority of *Dioscorides*, with that other citation following out of an anonymous Greek author, strongly proves my assertion, that the *drachma Attica* was more ponderous than the *denarius consularis*. For there being eighty four of these *denarii* in the *Roman pound*, as we have elsewhere proved, and ten *Roman pounds* in the *congius*, it is most evident there are 100000 *denarii* in the whole *congius*. Again, 100000 *drachms* by the testimonies of *Dioscorides*, and this anonymous writer being equal to the *congius*, and the *congius* being equal to 100000 *denarii*, therefore 100000 *drachms* are equal to 100000 *denarii*, and therefore of necessity every particular *drachma* of these, must be greater than each particular *denarius*. And tho', according to my assertion, the *congius* containeth some few *drachms* more than are by them assigned; yet that difference, seeing it might many ways happen, as I afterwards shew in the like experiments of *Villalpandus*, and *Gassendus*, it cannot any way overthrow my conclusion: for the *drachms* are still fewer than the *denarii consulares*, and therefore greater; which was the thing intended to be proved. And this may further be confirmed, in that both *Cleopatra*, and this anonymous author, make also the *sextus*, or *sextarius* (being the sixth part of the *congius*) to contain an hundred twenty *drachms* of fountain-water. Whereby it appears there is no error committed in the former numbers: Ὁ χυρὸς μέγεθος μίαν ἔχει καὶ ὕμους ἑβ. σαβύον δὲ ὕδατος ἡμικύβητον, ὅπως ἑστὶν ἀψιδιδαμένων, δεκα-

μᾶλλον ἢ: Amongst the Romans is found the congius, containing in measure six sextarii (that is) XII cotylæ: but in weight of rain-water, which is most infallible, 100000 drachmes. And whereas <sup>1</sup> Dioscorides elsewhere writes: Τὸ αὐτὸν ἔχει λίτρας θ. π. ὁ μικρότερον ἢ. S. ὁ ἕτερος ἔχει λ'. α. S. The congius bath nine pounds; the semicongius four and a half; the sextarius one and an half: there is no repugnancy between this and his former assertion. For here he speaks of the congius filled with oil, and before of the same congius filled with water, or wine: and that this should be but nine pounds, whereas the former is ten, is no more repugnant to reason, than it is to nature, that oil should be lighter than water or wine: which <sup>2</sup> Ghetaidus, in his *Archimedes promotus*, hath demonstrated the most accurately of any man, to be in the proportion that 1 is to 1  $\frac{1}{2}$ , in respect of water, and as 1 is to 1  $\frac{1}{4}$ , in respect of wine; which is almost the same with Dioscorides. The not observing this difference of weight, arising from the different gravity of several liquors, in vessels of one and the same capacity, is that which hath occasioned much uncertainty and confusion, in modern writers. And therefore we shall for farther perspicuity insert that distinction, which is often inculcated by <sup>3</sup> Galen, that the Romans used two sorts of ounces and pounds: and those were either *sabmu-kal*, or *μικρά*, ponderal or mensural; the one had respect solely to the gravity, the other to the moles, and gravity conjointly; the former were always certain and fixed, consisting of solid matter; the latter were *vaja* (frequently, *ἐν νεύροις*) being receptacles and measures of liquid substances: and therefore the *libra*, and *uncia mensurales*, in these were greater or less, accord-

ing as the liquor to be measured was heavier or lighter. Whence <sup>4</sup> Galen blames physicians for not expressing this difference: Διὸ γὰρ οἱ ἰατροὶ ἐπιμαρτυροῦσι ἐν τῷ φαρμακείῳ βίβλῳ τὰς λίτρας ὅσας τιδὲ καλεῖται βαλάντιον τὰς ὑγρὰς ἢ τὰς λίγρας τῷ ὄγκῳ φαρμάκων, πότερον τὰς μετράδας, ἢ τὰς σαβμικάς. And he gives the reason of it. Πάλιν δὲ σαβμικὰ πῶς αἰετὸν τῷ σωματίῳ, ἢ μὲν καὶ ἢ ἕτερον. For the ponderal examines the weight of bodies, but the mensural the moles. But to return to the congius, and by it to our discovery of the denarius. The water then must be natural, either of some fountain, or of rain. For if it be artificial, such as are made by distillations, whether by a strong reverberation, or by a gentle, in an alembick; these having somewhat of the property of fire, will be lighter than the natural, as <sup>5</sup> Agricola and others observe. I shall produce two observations of the congius, with fountain-water, made by two very eminent and able men, *Villalpandus*, and *Gassendus*, the one at *Rome*, with the Roman weights, from the <sup>6</sup> original congius itself; the other at *Aix*, with the *Paris* weights, from a model, or copy of that at *Rome*, procured by *Peireskius*. And here to compare the denarius *confularis* with their observations, it is necessary to have exactly both the Roman and *Paris* weights. The former, with as much accurateness as it was possible, were taken in *Rome*: the other were sent me by *monfieur Hardy*, a learned man of honourable quality in *Paris*, who compared them with the standard. To begin with that of *Villalpandus*, who gives us a large description, with how much caution and circumspection, and with how exquisite a balance he twice made his experiment, whereby he discovered the weight of it in

<sup>6</sup> Perinde verò ut vinum hoc satissimum omni nativo est levius, sic aqua: foris omnes, quæ ignis calore rebus quibusque excodis diffillarint, quas ob id diffillatas appellant, ceteris aquis leviores sunt. Agricola, l. 3. de pondere rerum.

<sup>7</sup> This congius I had weighed, if I could have procured a balance of such exactness, as was fitting for such a work. The want of which occasioned *Villalpandus* to suspect the observation of *Pætus*; though *Pætus* writes thus of himself. Plenum, cum iustissimâ trutinâ, quâ bodie Romæ utimur cum appendissem [congium,] invenî aquam, quâ eum compleveram, libras nostri temporis novem, uncias sex semis: efflere, quibus uncias quinque drachmas quatuor, scripulum unum, & grana XIV (quæ amplius sunt in his nostris, quam in antiquis libris computando eum congium libras decem) & ultra scripulum unum, & grana XIV (de quibus nullam rationem habendam esse judicavi) ex antiquis libris prædictis pendere invenî. But *Villalpandus* trying it long after *Pætus*, with more care, and with a balance made of purpose, found it to be exactly ten such pounds as are now used in *Rome*. All that I could do was to fill the capacity of it with *milium* well cleaned, and to compare it with the English measures taken from the standards. It contained of our measures for wine three quarts, one pint, and one eighth part of a pint. Of our corn, or dry measures, three quarts, and about one sixth part of a pint. At my being in *Italy*, there was found amongst the ruins at *Rome* a semicongius in brass, of the same figure with this of *Vespasian's*, the sides much consumed by rust. This I also measured, and found it to be the half of *Vespasian's* congius. From this measure of the congius we may rightly apprehend how vast that draught was of *Novellus Torquatus*, who drank three of these congii at once: from whence he was called *Novellus Tricongius*. The story is recited by *Pliny*, (l. 14. c. 22.) Apud nos cognomen etiam *Novellus* Torquatus *Mediolanensis* ad præconulatam usque et præturâ honoribus gestis, tribus congiis (vide & athen illi fuit) epotis uno impetu, spectante miraculi gratiâ Tiberio principe in senecta jam jecero, atque etiam aliis sævo, sed ipsâ juventut ad merum prætor fuerat. In the same chapter *Pliny* likewise discourses thus of *Cicero*, son to that famous orator: *Tergilla Ciceronem Marci filium binos congiis simul haurire solitum ipse objicit, Marceque Agrippæ à temulento scrybnum impatum.*

**W**ATER to be exactly answerable to ten such pounds as are now used in Rome: whence he concludes, ' *Constante asserimus antiquam Romanorum libram, unciam, ac pondus, tot aetatem successione, ac Romani imperii perturbationibus minime immutata fuisse, sed eadem per manus tradita usque ad nostra tempora perlarasse.* ' This Roman pound of his reduced to the English standard for silver, or Troy weight, with which I have faithfully collated it, is 5256 grains English, such as the Troy pound is 5760; the whole *congius* therefore consisting of ten pounds, will be 52560 English grains. The other observation is related by *Gassendus*, in his excellent discourse *De vitâ Piræti*: *Ut paucis ergo res dicatur, cautiones addimus easdem, quas Lucas Petus, & Villalpandus, dum vas ipsum, ad summum collum puteali aquâ oplevimus, expendimus, & ejus pondus subduximus. Deprehendimus autem aquam, quæ Romano pondere esse debuit decem librarum, seu unciarum centum viginti, esse pondere Parisiensi (quale nempe Parisiis exploratum, missumque est) librarum septem, minus uncia quadrante: seu unciarum centum undecim, & quadrantum uncia i. ium. Deinde ex hac proportionem collegimus unciam Romanam continere grana quingenta, & triginta sex, qualium quingenta, & septuaginta sex in Parisiensi continentur: unde & illis in drachmas collectis, obvenire cuilibet drachmæ grana sexaginta septem: idque proinde censuimus pondus denarii Cæsaris, quem dictum est fuisse "drachmalem. Now the Paris ounce sent to me by monsieur Hardy, containing four hundred seventy two grains English, and an half; and the *congius*, according to *Gassendus*, of the Paris ounces 111  $\frac{1}{2}$ , the complete weight of the *congius*, in grains, will be 52801  $\frac{1}{2}$ . Which sum exceeds that of *Villalpandus* by 241  $\frac{1}{2}$ ; that is, by more than half a Roman ounce. This difference (tho' it is not great) between these two observations of theirs, might arise, either from the unequal swelling of the water in the *congius*; or from the different gravity of fountain-water at Rome, and at Aix; or from some inequality of the model and original; or from*

defect in the *jugum*, or beam of the balance, which it it were not made by a very skilful hand, by the pressure of so great a weight, would suffer some alteration. Which way soever it was, either by some, or all of these, the difference cannot prejudice my conclusion a complete grain; which no reasonable man but will allow, either for coining, or for waste: for if I divide 52560, the number of grains in the *congius*, according to *Villalpandus*, by 100000, the number of the *denarii* in ten pounds, the sum will be 525  $\frac{6}{10}$ . Or if we shall follow *Gassendus*, though I should rather prefer *Villalpandus*, because he took his immediately from the original, then will the weight of the *denarius consularis* be 525  $\frac{1}{10}$ . The fraction in both without any convenience may be omitted. And this proportion of the weight of the *denarius consularis*, if it were necessary, I could farther prove by some of the *aurei consulares*, which often were double in weight to the *denarii*, as the *αυρεοί* *ἀνδροί* were double to the *δηνάρια* *ἀνδροί*; as also by several *quinarii* in silver (which are the half of the *denarii*) by a very ancient and perfect *sestuncia*, by a *quadrans* and *triens*, all of them in brass of mine own, and by several other weights examined abroad. One of them I cannot pretermitt, being near five Roman pounds, and very remarkable for this inscription: **EX. AUCTORITATE Q. JUNI. RUSTICI. PR. VR.** but the weight of it is a little defective; part of the *filum* (as many of the ancient Roman weights that I have seen, were *sex filice*, which is as hard or harder than marble) being broken away, else the rest is very entire and well polished. But I conceive, that by those former ways I have so irrefragably demonstrated the true ponderousness of the *denarius consularis*, that it would be thought superfluous, or a vain ostentation, to endeavour any farther to prove it. Wherefore instead of that I shall handle the *denarius caesareus*, which is our second enquiry.

The *denarius caesareus*, was that which was made under the government of the *Cæsars*. And this instead of the face and inscription *ROMA*, with the character X

<sup>1</sup> Villalpandus, l. 2. disp. 2. c. 11. de apparatu urbis ac templi.

<sup>2</sup> The inference of *Gassendus* I easily grant, that the *denarius*, under some of the *Cæsars*, was *drachmale*; that is, the eighth part of the Roman ounce. But neither was it always so under the *Cæsars*, nor if it had been so, will it therefore follow that it was *drachmale*, or the eighth part in respect of the Attick ounce. Seeing the *Athenian* ounce was greater than the Roman, as we have before proved; and therefore the *denarius consularis*, which was the seventh part of the Roman ounce, was scarce the eighth part of the Attick. Wherefore he must see how he can make it good, where he brings *Pirætiensis*, in the second book of his life, thus discoursing: — *Denarium, cum tempore regum pendisset tridentem unciam, sub antiquâ tamen rep. pendisset solum sextantem, sub recentiore partem septimam, sub primis Cæsaris ab octava, seu drachmam (Attica nempe drachma æqualem).*

<sup>3</sup> Of these Roman *sestunciae*, I have bought and seen several in brass. Besides one, which I owe to my very worthy and learned friend, doctor Ent.

<sup>4</sup> *Pactus*, l. 1. c. de antiq. Rom. & Græc. intero. mensuris, makes mention of a *libra Romana* in brass, procured by *Fulvius Ursinus*, of singular rarity: *In cujus supremâ plantis argenteis literis hæc erat nota I. & in circumferentiâ hæc alia EX. AVG. D. CABS.* But this I had not the happiness to see in Italy.

or  $\text{X}$  on the fore-part, and the impress of the *biga*, or *quadriga* on the reverse, (in which kind most of the *denarii consularis* were stamped) had on the reverse several impresses, and on the other side the image or resemblance of the emperor: which occasioned our Saviour to ask the question, when a *Studeus*, or Roman penny was shewed to him, *Whose is this image and superscription? They say unto him, Caesar's.* This *denarius Casareus*, if we respect some definitive quantity and weight, was as various and uncertain as the *denarius consularis* of the later consuls was constant and fixt; being under the first emperors, sometimes more, sometimes less, as the reasons and exigencies of the state did require, or the profuseness and prodigality of those times. Yet this uncertainty (as far as I have observed) was limited within some certain and determinate bounds: the *denarius Casareus* never exceeding the seventh part of the Roman ounce, and never being less than the eighth part, but often in a middle proportion between both, and that with much inequality. And this made *Villalpandus*, after many experiments at Rome, to conclude, that out of the *denarii* nothing concerning the Roman weights could be determined. Tho' *Portius, Agricola, Ciaconius, Snellius*, and several others, before and after him, are of a contrary opinion. And it may be, if *Villalpandus* had distinguished between the difference of times, and in them of the different coins, and considered those of the consuls, distinctly from those of the *Cæsars*, and those of the former *Cæsars* from those of the later, he would have reformed his judgment: for it plainly appears, upon examination, that the diminution of their weight was an invention introduced after *Antonius the Triumvir's* time, whereas before the *denarius* was fix'd. *Miscuit, saith Pliny, denario triumvir Antonius ferrum, alii è pondere subtrahunt* (his meaning is under the emperors, to *Vespasian's*, or his own time) *cum sit justum octoginta quatuor è libris signari*. Where he says very well in speaking so generally, *alii è pondere subtrahunt*, without precisely limiting the proportion. For this, as we observed, was very various and undeterminate: so that whereas the just number of the *denarii*, according to the practice of the later consuls, should be eighty four in the Roman pound, we find by the weight of the best of them under the former *Cæsars*, that they coined sometimes eighty six, eighty eight, &c. till at last there came to be ninety six *denarii* in the Roman pound,

that is, eight in the ounce. And this, by a very necessary consequence, may be inferred out of another place of *Pliny*, if we take for granted what some learned moderns confess, and the gold and silver coins found to this day, of the later consuls, and first emperors, strongly prove, that as the *Atticks* made their *χρυσός*, or *aureus* double in weight to the *δραχμή ἀργύρεα*: so did the Romans make their *aureus* double in weight to the *denarius*. Which proportion they might borrow from the *Athenians*, and other *Grecians*, who, as *Arias Montanus* imagines, first received it from the practice of the *Hebrews*: or rather, as I suppose, from the *Phenicians*, and thence from the *Hebrews*. From whence soever it came, it is not much material in our enquiry: that which we may safely conclude from thence is this; that the gold being in respect of weight, double to the silver, the *aureus Romanus* falling in its weight, the *denarius* likewise of necessity must fall: else could they not have continued in *dupla ratione*. Now in what manner the *aureus* was first coined, and how afterwards it lost of its primitive weight, *Pliny* informs us: *aureus nummus, post annum LXII percussus est, quam argenteus, ita ut scrupulum valeret sestertius vicenis, quod efficit in libras ratione sestertiorum, qui tunc erant, sestertius XXXX. Post hæc placuit XL. M. signari ex auri libris: paulatimque principes imminuere pondus, imminuisse vero ad XLV. M.* For this testimony, and the former, we are to thank *Pliny*, seeing there is neither Greek nor Latin author extant, from his time to *Theodosius*, that gives us any certainty, what to conclude concerning the ancient coins. And therefore since this later is of great consequence, but somewhat corrupted, I compared it with the MSS. in the Vatican and Florentine libraries, and with a fair one in Baliol-college, which renders the later part of it thus: *Postea placuit x. xl. signari ex auri libris, paulatimque principes imminuere pondus, imminuisse vero ad XLVIII.* Where for *XLVIII*, *Villalpandus* corrects, or rather corrupts the text in writing *XLV*. But *Agricola*, and *Snellius* read it by conjecture thus: *Post hæc placuit XLIII signari ex auri libris, paulatimque principes imminuere pondus, minutissimè vero ad XLVIII.* And *Snellius* gives a reason of it in his *Eratosthenes Batavus*. *Nam ita argentei denarii, & aurei: immixta eadem manet analogia, pondere subduplo, ut quamdiu octoginta quatuor argentei è libra, & è singulis uncis septem cudebantur, tam diu quoque aurei duo & quadraginta libram implerent, postquam vero argentei num-*

<sup>g</sup> Arias Montanus in *Thubal Cain*, sive de mensuris.

<sup>h</sup> Plinius, l. 3. c. 33.

<sup>i</sup> Snell. in Eratosth. Batav.

**GREAVES** *mi pondus immixtum est: ut sex & moneta in libram constituerentur, tum quique duo de quinquaginta aurei, pondere tanto leviores, in singulis libris cudi ceperunt.* Which conjecture seems not altogether improbable, if we respect the later consuls, and first *Cæsars*, in whose times we find the *aurei* to have been double to the *denarii Cæsarei*; but surely long before *Justinian*, the *aurei*, or as they were then also called the *solidi*, lost that proportion to the silver, and kept it only to the *semisses aurei*, to which they were double, as they were in a treble proportion to the *tremisses*.

Wherefore instead of these conjectures (which have been the bane of many a good author) of *Agriola*, *Villalpandus*, and *Snelhus*, I would read the later part of those words of *Pliny*, as the MSS. do, till I can see some concluding reason, or good authority of ancient authors to the contrary, for I do not see why the *Romans* at the first might not coin forty *aurei* out of the *libra*, as well as forty silver *teruncii* out of the *denarius*: which *Varro* assures us they did. And who knows whether at the first making of their gold coins, which was sixty two years according to *Pliny*, after the first coining of silver, they endeavoured to keep them in *dupla ratione*, in respect of weight: which graceful manner they might afterwards introduce by commerce with the *Grecians*.

And here, e'er I proceed any farther in my enquiry after the *denarius Cæsareus*, I cannot but complain, either of the negligence of former times, or unhappiness of ours; in that not one author extant mentions the true weight of the *denarii*, under the *Cæsars*. <sup>1</sup> *Xiphilinus* relates in his epitome of *Dio*, how *Antoninus Caracalla* corrupted and abased the coins; but makes no mention of the weight. *Τῶν δὲ Ἀντωνίνου, τὰς ἀλλὰ καὶ τὸ νόμισμα κίβδηλον ἦν, τὰς ἀργύρου καὶ τὸ χρυσίου, ὁ παρήγεν ἡμῶν, τὸ μὲν οὐκ ἀπολύτως καὶ ἀκριβέστατον, τὸ δὲ καὶ οὐ καλῶ καὶ ἀκριβέστατον ἰσχυροῦς.* To *Antoninus*, as other things, so also his money was adulterated: for the silver and gold, which he gave us, the one was prepared of lead silvered over, and the other of brass gilt. <sup>2</sup> *Suidas* also speaking of the *monetarii* writes thus: *Μονηταῖοι οἱ καὶ τὸ νόμισμα τεχνῶν, οἱ δὲ Ἀντωνίνου διέφθειραν τὸ νόμισμα, καὶ τὸ ἰδίον ἀργύρεον φιλικότατον ἀνελόντες ἐμφύλιον ἔχρησαν πολεμικόν, ὥς μέλει Ἀντωνιανῶς χρηματισμῶν. (Ἐπεὶ βασιλεὺς καλῶσαν ὁμότητι καί μετὰ γὰρ.* The *monetarii*

are artificers employed in the making of money. These, in *Aurelian's* time, corrupted the money; and, having slain their governor *Felicissimus*, raised a civil war, whom *Aurelianus* with much difficulty conquering, put to death with exquisite torments. And many good laws were made by several emperors, against adulterating and corrupting of coins: and those executed with much severity, even in the time of Christianity: for we find under the emperor *Constantine*, that such as offended in this kind, were not only put to death, but to a cruel and bitter death by fire. *L. OMNES SOLIDI. C. THEOD. SI QVIS SOLIDI CIRCVLMV EXTERRIOREM INCIDERIT, VEL ADULTERATVM IN VENDENDO SVBJECERIT. Omnes solidi, in quibus nostri vultus, ac veneratio una est, uno pretio aestimandi sunt, atque vendendi, quanquam diversa formæ mensura sit: quod si quis aliter fecerit, aut capite puniri debet, aut flammis tradi, vel aliâ pœnâ morisferâ. Quod ille etiam patietur, qui mensuram circuli exterioris adraferit, ut ponderis minuat quantitatem, vel figuratum solidum, adulterii imitatione, in vendendo subjecerit.* In *Constantius's* time the same punishment was inflicted. *L. PRÆMIO. C. THEOD. DE FALSA MONETÆ. Præmio accusatoribus propositio, quicumque solidorum adulter potuerit reperiri, vel à quoquam fuerit publicatus, illico omni dilatione submoâ flammarum exustionibus mancipetur.* And afterwards under *Valentinianus*, *Theodosius*, and *Arcadius*, they were accounted, and suffered as *rei læsæ majestatis*. *L. FALSÆ MONETÆ. COD. EODEM. Falsæ monetæ rei, quos vulgò paracbaras vocant, majestatis crimine tenentur obnoxii.* But no where is it mentioned concerning the *denarii* and *quinarii*, which were the silver coins in common use, how much should be their weight. Wherefore in such a silence of ancient authors, we have no more solid and sure foundation of our enquiry, than either by our selves to examine the weight of the fairest coins under the emperors; or else to relate what others long before our time have observed. *Antonius Augustinus* in general informs us, when coins were at their highest perfection, and how they began to decline with the *Roman* empire: as commonly when money comes to be abased, and that the mint, like the pulse, beats too slowly and irregularly, it is an evident symptom of some distempers in the bowels of a state. <sup>3</sup> *The medals of all times (saith*

<sup>5</sup> *Le medaglie di tutti i tempi [sono degne da esser offerate degli Artifici] cominciando da Alessandro magno, nell'età del quale principalmente fiorirono, per fin al tempo dell'Imperator Gallieno, nell quale caddero affatto insieme con l'Imperio. Da indi poi in finà Giustiniano si trovano ben medaglie di tutti gli Imperadori ma con notabil perdita della pulitezza, & perfettione antica. Quel poi che habbiamo doppo Giustiniano, è tanto*

he) [are worthy to be observed by artizans] beginning from Alexander the great, in whose time they principally flourished, till the emperor Gallienus, when they chiefly fell together with the empire. From thence to the end of Justinian, there are found good medals of all the emperors, but with a notable diminution of their politeness and ancient perfection. Those which we have after Justinian are insufferably bad. The fault by all men is assigned to the Huns, and Vandals, and Alanes, and Goths, and Longobards, and to other bar- barous and savage nations, who conquered the greatest part of Europe. Erizzo, who lived almost an hundred years since, a very diligent man in the Roman coins, but it is to be wished that he had used more judgment in the explication of them, more particularly informs us. "Having compared the weight of those sorts of money, which are equal in weight to the Roman denarius, with the medals of silver, which have the heads of the Roman emperors: imprinted, I have found them not a little different, so that as it were all those medals weigh less than the denarius. And having also weighed those medals which have the effigies of the Cæsars, I have continually found them different amongst themselves in weight. This uncertainty so troubled Villalpandus, after many experiments made at Rome, that he knew not what to determine. And it seems "Blondus long before conceived it impossible: *Hæc omnia qualia per singulas ætates fuerint, ex amissim ostendere, non magis difficile, quàm impossibile fuerit, non solum quia obscuris & nostræ ætate ignotis verbis sunt à majoribus tradita, sed quia omnis sævæ etas suam habuit cudenti varietatem, & formam.* Wherefore, for farther satisfaction of the reader, I shall relate some observations of mine own: especially those of the twelve first Cæsars, which I took, with many others, by an accurate balance, from such choice cabinets in Italy. And first, I shall begin with the gold coins: for seeing the aurei under the former Cæsars were in dupl<sup>a</sup> ratione to the denarii, therefore the weight of those being known, we cannot be ignorant of the weight of the denarii Cæsarei. Besides, they are not subject to be consumed by time and rust, but only *ex interimento*, and therefore we may the safer give credit to them. And lastly, because the difference, tho' but of a grain, is of some consideration in gold, the masters of the mint use to be the more circumspect about them:

whereas in silver coins, since it is hardly <sup>GREAVES</sup> worth the pains to stand precisely upon the excess or defect of every grain, therefore there are few of these so exact, but either exceed or want in the very mint, one or two grains, and sometimes more.

GREAVES

These *aurei* were selected by me out of several others, as the fairest and entirest; and amongst these to such as I have prefixed an asterisk, they are such as seemed so perfect, that I could make no just objections against them. By these it appears that *Pliny* speaking of the gold coins, rightly informs us: *Paulatimque principes imminuere pondus, imminuisse vero ad XLVIII. Tbat by degrees the emperors lessened the weight [of the aurei] to the forty eighth part of the Roman pound; that is, to the fourth part of the ounce. For this is the lowest weight, that I find, till Heliogabalus's time, who coined new sorts of aurei, different from what had been the constant practice of the Roman state: some of which were the fiftieth part of the libra Romana, and others again so massy, that they were centeni, or bilibres; which not long after were altered and abolished by Alexander Severus. The manner is expressed by *Ælius Lampridius*, in the life of Alexander Severus: *Formas binarias, ternarias, & quaternarias, & denarias etiam, atque amplius, usque ad bilibres quoque & centenas, quas Heliogabalus invenerat, resciri præcepit, nec in usu cuiusquam versari: atque ex eo his materia nomen inditum est, cum diceret plus largiendi banc esse imperatori causam, si cum multis solidos minores dare posset, dans decem vel amplius una forma, triginta, & quinquaginta, & centum dare cogere.* Under the same Alexander Severus began the *semisses aureorum*, and *tremisses* to be coined, which had not formerly been in use. The *semisses* were answerable in weight to the *denarii Casarei*, when they were least, that is, ninety six in the Roman pound; though *Agricola*, *Vilalpandus*, and others, upon a mistake, equal them then to the *drachma Attica*. *Ælius Lampridius* writing of Alexander Severus, plainly expresses, that in his time they began. *Tumque primum semisses aureorum formati sunt, tunc etiam, cum ad tertiam partem aurei vestigal decidisset, tremisses, dicente Alexandro etiam quartarios futuros, quod minus non posset.* Afterwards *Constantine*, *Constantius*, *Julian*, and other succeeding emperors, lessened the weight of the *aurei*, whereby there came to be seventy two in the Roman pound, so that each of them weighed the *sextula*, or four *scrupula*. That*

the *aurei* of *Constantine's* time were sixty two in the Roman pound, is most evident out of the *codex Theodosianus*, where they are also absolutely called *solidi*, without the addition of *aurei*. *L. SI QVIS. C. THEOD. DE PONDERATORIBVS, ET AVRI INFLATIONE. Siquis solidos appendere voluerit auri cœsti, septem solidos quaternorum scrupulorum, nostris vultibus figuratos, adpendat pro singulis uncis. xiv. vero pro duabus, juxta banc formam omnem summam debiti inflaturus, eadem ratione servanda, etsi materiam quis inferat, ut solidos dedisse videatur.* \* *Pancirollus*, in his *Thesaurus variarum lectionum utriusque juris*, reads vi *solidos*, instead of vii, and xii instead of xiv. And that it must necessarily be so, besides that the *solidi* of *Constantine* now extant prove as much, may be collected out of the proportion of weight which is here assigned by *Constantine* himself to the *solidi*, and that is four scruples, or the *sextula*. For the *solidus* containing four scruples, and the ounce containing twenty four scruples, there will therefore be six *solidi* in the ounce: again, the pound consisting of twelve ounces, and the ounce of six *solidi*, the whole pound therefore will consist of seventy two *solidi*. These *aurei* by *Justinian*, in like manner, are termed *solidi*. *L. QUOTIESCVNQUE. C. DE SVSCEPTORIBVS, PRÆPOSITIS, ET ARCARIIS.* Where he also defines the same weight. \* *Quotiescunque certa summa solidorum pro tituli qualitate debetur, & auri massa transmittitur, in LXXII. solidos libra feratur accepta.* The same thing is implicitly confirmed by *Isidorus*, (*l. XVI. Orig. c. 24.*) *Solidus alio nomine sextula dicitur, quod iis sex uncia compleatur. Hunc ut diximus, vulgus aureum solidum vocat, cujus tertiam partem ideo dixerunt tremissem, quod solidum faciat ter missus.* Where \* *Agricola*, I imagine, truly finds fault with him for calling the *solidus*, *sextula*; tho' the proportion he assigns is right; that is, that the *solidus* was the sixth part of the Roman ounce, and contained *æqualis sabbon*, the weight of the *sextula*, as it is attested by *Zonaras*: or, which is all one, that seventy two *solidi* were made out of a Roman pound, as *Justinian* before expressly assigned: and as infinite store of the *solidi*,

\* *Plin. l. 33. c. 3.*

\* *Lampridius in Alex. Severo.*

\* *Codex Theodof. l. 1. de ponderatoribus.*

\* *Gui. Pancirolli thesaur. var. lect. utr. juris.*

\* *Cod. lib. 10. tit. 70. in recripto Valentiniani & Valentis Imp.*

\* This excellent place very hardly escaped *Halsander's* emendation, who had a great mind to have played the critick, and to have altered it. For he thus writes, *In vestito codice in rasam membranam hac ita rescripta sunt, ut certum sit alteram, & fortasse genuinum lectionem sublatam, & legendam, duodequingigesima, aut certe quingigesima.* A goodly consequence, because the parchment was scraped, and the first writing altered, therefore the true reading must be expunged, and a false one put in: whereas he might with more candour and ingenuity have concluded the contrary, that the false one was expunged by the scribe, and the true one inferred. For who uses in copying of MSS. to scrape any thing out of the *apographum*, but only when by collating it he finds it to be different from the original?

or *aurei*, from *Constantine* to *Focas*, which I have weighed, manifestly prove.

In the same place of *Isidorus* we may collect the reason why the *aureus* was called *solidus*. After that, the *semisses*, and *tremisses aurei* were coined, the *aureus* was called *solidus*, because nothing was wanting to it. *Solidum enim antiqui integrum dicebant, & totum*: in which sense the *solidus* was also taken for the *libra* or *assis*; that is, as the *assis* is taken for the whole, according to that usual phrase of *civilians*, *ex assis bæres*, when one is heir to the whole inheritance: so the *solidus* was taken for the whole *assis*. *Volusius Metianus*: *Prima divisio solidi, id est libræ quod as vocatur, in duas partes dimidia deducitur*. From hence (saith *Salmasius*) the Romans called that the *solidus aureus*, when it had the same weight in gold, which the *solidus*, that is, the *assis* had in respect of *brass*, that is, two *drachmes*. Though I rather suppose that the *aureus* was called *solidus*, first of all in *Severus's* time, not for containing two *denarii* in weight, (which *Salmasius* calls *drachmes*) for so it always did under the later consuls, and first emperors, but because the *aureus* was then first divided into two parts; that is, into the *semisses* and *tremisses*, and so relatively to these the whole *aureus* was rightly called *solidus*. Of the same opinion is *Agricola*: *Quos aureos, cum respectum ad semisses & tremisses haberent, tunc primo dixerunt solidos, quod semisses ex dimidia eorum parte, tremisses ex tertia constarent*.

The *semisses* and *tremisses* of the other emperors, at some distance after *Severus*, came to be less in the same proportion, as the *aurei* were lessened. For the *aurei* of *Severus* were double to the *denarii Casarii*,

and therefore but forty eight in the pound, and not fifty, as *Heliogabalus* made, whose error *Severus* corrected. But when the later emperors made seventy two *aurei* out of the Roman pound, the *semisses* came also to be diminished, and were half of these new *aurei*, and not of the former, and the *tremisses* the third part. And here the *aurei* lost that proportion which they kept before, of being double to the *denarii*. Of these *tremisses* is *Justinian* to be understood, *L. FORTISS. MILITIBUS. COD. DE MILITARI VESTE*. *Fortissimis militibus nostris per Illyricum non binos tremisses pro singulis clamydibus, sed singulos solidos dare precipimus*. And this may be farther proved by a fair *tremissis* in gold of mine own of *Justinian*, with the inscription *D. N. JUSTINIANUS*, weighing twenty one grains *English*, and therefore wanting only three grains  $\frac{1}{2}$ , which it may have lost by time: otherwise it would be exactly the  $216^{\text{th}}$  part of the Roman pound; that is, the third part of the *aureus*, or *solidus* of those times: whereas if it had been coined to the proportion of the *aureus*, when there were forty eight in the pound, it should have weighed  $36$  grains  $\frac{1}{2}$ , so that it must have lost  $15 \frac{1}{2}$ , a difference so great in a piece of gold so fair, and withal of so small a quantity, altogether improbable. And therefore this coin alone, if no more were extant, would confute their opinion, who maintain that the *tremissis* of *Justinian* differed not from the *tremissis* of *Severus*, and consequently the *aurei* of them both, better than the reasons produced by *Covarruvias* to the contrary have done.

<sup>a</sup> Isidorus, l. 16. orig. c. 24.

<sup>b</sup> Vol. Metianus de assis distrib. <sup>c</sup> Hinc & solidum aureum dixerunt Romani, ubi idem pondus habere capi in auro, quod solidus, id est, as haberet in ære, duarum nempe drachmarum. Salmas. de modo Usur.

<sup>d</sup> Agricola, l. 2. de pond. & temp. monetarum. <sup>e</sup> I have since perused another *Tremissis* in gold, a very fair one, with this inscription, *D. N. JUSTINUS. P. F. AVG.* weighing twenty two grains, and better; which formerly belonged to the learned geographer, *Ortelius*. Besides a third, of *Majorianus*, with *CONOB* supercribed (which signifies, *Constantinopolitanum Obritzum*, or *Constantinopoli Obfignatum*) weighing likewise twenty two grains. And a fourth, of *Justinian*, weighing twenty three. <sup>f</sup> Covarruvias, tom. 1. c. 3. paragr. 1. & 2. de vet. aureis, & argenteis nummis.

And

And thus much of the *aurei* under the former and later emperors, as they serve to illustrate and prove the weight of the *denarii* *Cæsarei*, which is our next and principal enquiry.

The *denarii* under the *Cæsars* were almost as various and unconstant as the *aurei*, sometimes more, sometimes less; and if they had not been so, they could not have kept that proportion to the *aurei* of the former emperors, which we assigned. From *Augustus's* time to *Vespasian*, as I find by examining many of them, they continually almost decreased, till from being the seventh part of the *Roman* ounce, they came now to be the eighth part: and therefore ninety fix were coined out of the *Roman libra*, whereas before under the consuls eighty four. From *Vespasian* to *Alex. Severus*, as far as I have observed, the silver continued at a kind of stay in respect of weight, excepting only such coins, as upon some extraordinary occasion, both then, and in the first emperor's time, were stamped either in honour of the prince, or of the empress, and *Augusta Familia*, or else in memory of some eminent action. These last, most usually, were equal to the *denarii* *consulares*, and many of them had these characters, *E. X. S. C.* or else *S. P. Q. R.* Under *Severus* and *Gordianus*, the *denarii* began to recover their primitive weight, and came to be equal to the *denarii* *consulares*, the half of which also were exactly the *quinarii*; and so continued during the succeeding emperors, till *Justinian*, with little diminution, but most commonly with a notable abatement and mixture of alloy. After *Justinian* there happened such a deluge of barbarous nations, which overflowed the greatest part of *Europe*, that not only the coins, but even the liberal arts and sciences, began with the majesty of the empire to decline from their first lustre and perfection.

Wherefore I shall not speak of the *μυλιαριον*, or *μυλιαριον*, a sort of silver coin in use before, and after *Justinian* which some collect out of *Cedrenus* to have been the eighth part of the ounce, and therefore equal to the *denarius* in the lowest valuation; tho' *Suidas* renders, *μυλιαριον* τὸ τοῦ νομισματος δίκαιον, and the *Sebastiastes Basilic. eclog.* 23. δικοδικαιον, and to contain twenty four *φωλλες*. But I shall not positively determine either the weight of this, or of the *κεκοικον*, or *siligua* in silver, both coined when the imperial seat was translated to *Byzantium*, unless I had examined some of the fairest of them. And for the same reason I shall not define the *Hebrew denarius*, mentioned

by *Elias the Tishbite*, in the word *יִינִיָּה* and by *Gal. 1. 10* *Moyses Gerundenis* upon *Exodus*, and by the *Chaldee paraphrase*, 2 *Reg. v. 5.* which I imagine to have been no other than the *Roman denarius*, used by the *Jews*: neither shall I determine the *Arabian dinar*, and *derbam*; the former of which the *Rabbins* call *יִינִיָּה עִרְבָּא* used by *Rbasis*, *Avicen*, *Meshe*, and by several other *Arabians*, both physicians and historians. All that can certainly be concluded is this, that by the *dinar*, when we speak of a coin, is meant sometime the *denarius*, and sometime the *aureus*: but when we speak of a weight, always the *aureus* is understood; as by the *derbam*, the *δραχμα*, or silver drachme. But surely the quality of the thing is different from the name: the silver drachme of the *Arabians*, as it is generally now used in the *Mahometan dominions* in the *East*, consisting of *xlviij* 4½ grains *English*, (as I have found by weighing many of them) which is much less than either the *drachma Attica*, or the *denarius Consularis*; and somewhat less than the *denarius Cæsareus*. And yet it is not improbable but that this may have continued with them without any diminution, for six or seven hundred years to our times, as well as the *Roman* pound and ounce have continued entire sixteen hundred years and better. But to omit any farther prosecution of the *dinar* and *derbam* of the *Arabians*, which may hereafter more fully be discussed, when we shall handle their measures and weights, and to go on with our discourse of the *Roman denarius*. After the breaking in of so many barbarous nations, as of a torrent, into the *Roman* empire, the *denarius* began generally to be disused; every one almost of these, as an argument of their sovereignty and conquests, making new coins of their own: or else such as continued the former, either by allays so abated the fineness, and valuation of the coins, or by several diminutions so impaired the weight, that the *denarius* totally fell, and at last almost vanished into nothing. Neither will this seem strange, if we shall consider, that the like alteration, in respect of weight, hath happened by the revolution of a less time, in our own coins. I shall instance in our *denarius* or penny, which in *Elisabeth's* time, that is, a little more than 150 years since, was the twentieth part of the *Troy*, or silver ounce: as *M. Lambard*, in his *Saxon Glossary* observes, and as by experience I have found (and the same proportion was anciently observed by the *French*, in their *denier*.)

<sup>a</sup> Cedrenus in histor. compend.

<sup>b</sup> Suidas in voce μυλιαριον.

<sup>c</sup> P. 72. col. 4.

<sup>d</sup> Lambardi Glossium Cantabrig. 1644.

<sup>e</sup> In appendice libri de limit. agrorum: Junta

Galles vigesima pars nostra denarius est, & xii denarii solidum reddunt.

**GREAVES** This proportion continued successively to Edward the first, in whose time we find the weight of the *denarius* by <sup>f</sup> Statute to be thus defined: *Per ordinationes totius regni Angliæ denarius Angliæ, qui vocatur Sterlingus, rotundus, sine insura, ponderabit xxxii grana frumenti in medio spica. Et xx denarii faciunt unciam, Et xii uncie faciunt libram.* Under <sup>1</sup> Edward the third it came first to be diminished to the twenty sixth part of the Troy ounce; and under <sup>h</sup> Henry the sixth it fell to the two and thirtieth; in <sup>1</sup> Edward the fourth's time it came to be the fortieth; under <sup>h</sup> Henry the eighth at first it was the fortieth, then the forty fifth. Afterward sixty pence were coined out of the ounce in the second year of <sup>1</sup> queen Elizabeth; and during her reign sixty two: which proportion is observed in these times. So that it is evident that *Ethelred's* penny was bigger than three of ours. And after times may see this of ours, as well as the *Roman denarius*, to be quite diminished, and brought to nothing. For if either our own exigencies, or the exigencies of foreign states with whom we have commerce, cause us or them (as occasions will never be wanting) to alter the proportions of the gold and silver coins, either in respect of weight, or in respect of purity, or lastly, in respect of the valuation the gold bears to silver; by all, or some of these causes, there will inevitably happen such a diminution of the penny (and proportionably of our other coins) that at length it will not be worth the coining. But I leave this speculation to such, whom it doth more nearly concern. And certainly it is a consideration not of the least importance; money being as the sinews and strength of a state, so the life and soul of commerce: and if those advantages which one country may make upon another, in the mystery of exchanges, and valuation of coins, be not thoroughly discovered, and prevented, by such as sit at the helm of the state, it may fare with them after much commerce, as with some bodies after much food, that instead of growing full, and fat, they may pine away, and fall into an irrecoverable consumption. But I return to the *Roman denarius*, which we have brought so low, that there is nothing now left of it, but only the name; and that also suffered an <sup>m</sup> alteration: for the later *Greeks* instead of the *δηνάριον*, called it the *σηνέριον*: and both *Greeks* and *Latins*, and sometimes the *Arabians*, took it not in the same

sense, as it passed for in the first institution; that is, for a silver coin, worth in valuation ten; or sixteen *asses*, but for any sort of coin whatsoever. And therefore <sup>n</sup> Meursius's observation, in his *Glossarium Græco-Barbarum*, is worth our consideration. *Postea δηνάριον dixerunt ævo corruptiore, Et generaliter pro quavis pecunia. Sicut Itali denaro. Galli denier. Hispani dinero. Anonymus de bello sacro.*

*Δηνάριον ἔχοντι πολλὰ, ὥστε τὰ ταχέστερα, Ἐπὶ αἰῶσι πολλοῖς καὶ οἱ πονεῖ μετ' αὐτῆς.*  
Whence the learned <sup>o</sup> Jos. Scaliger rightly observes, that, *Ultimis temporibus denarii pro exigua sipe usurpati sunt, ut hodie in Gallia. Imperator Aurelianus: Philippos minutulos quinquagenos, æris denarios centum. Eos Vopiscus in Bonoso sesteritios æris vocat. Macrobius de nummo ratilo loquens, qui erat æreus: Ita fuisse signatum hodieque intelligitur in alææ lusu, cum pueri denarios in sublime iactantes, capita, aut navia lusu teste vetustatis exclamant. In Evangelio secundum Marcum xii. λαλῶν δὲ ὁ ἰσὶ κα- δέξις. Hilarius, duos denarios viduæ in- opis Deo acceptiores. Luc. x. ἐκβαλὼν δὲ δηνάριον, Ambrosius, duo æra. Vetusissimus est igitur denarii usus, ἀντὶ τοῦ χρηματισμῶ, vel sipe. Thus far Scaliger.*

Such an uncertainty being then, as we have mentioned, both of the *aurei* and *denarii*, under the first *Cæsars*, in whose times the purest coins, and the best wits most flourished, and such an abatement and impureness of the silver under the later emperors, no reasonable man can imagine, that either the ancient grammarians, poets, orators, historians, or especially physicians, whom it did most concern to be precise, and most of which lived under the former emperors, did ever allude to the weight of the *denarius Cæsareus*, but rather to the *Consularis*. And to this only, and to no other, did the *Attick drachme* mentioned by *Dioscorides*, *Cleopatra*, *Galen*, *Julius Pollus*, *Oribasius*, and the rest of the *Greek* authors correspond. And thus have we finished our discourse concerning the *denarius*, in the notion and acceptance of the ancients, both *Greeks* and *Latins*.

Our next labour should be to compare it with the standards for weights of divers nations used in these times: for which I had recourse to the publick *Zygoſtata*, and *Ponderatores*, in my travels abroad; and for my observations I must refer the reader to this ensuing table.

<sup>f</sup> Stat. 31. Edov. 1.

<sup>h</sup> Stat. 2. Eliz.

<sup>m</sup> In the same manner the *solidus*, or *aureus*, as it lost its valuation, so suffered an alteration in the *Greek* name; for instead of *χρυσός*, we find the glosses to render it *χρυσόν*. *Glossæ, χρυσόν* *solidus*: and in the same glosses we read *δηνάριον* interpreted *δηνάριον*, and *δηνάριον* *sestertium*, and *δηνάριον* *λαλῶν* *αἰγρῶν*.

<sup>n</sup> Meursii *Glossarium Græco-Barbar.* in voce *δηνάριον*.

<sup>o</sup> Scalig. de re num.

*A TABLE of the gold and silver Weights of several Nations: Taken from their Standards, and compared with the Denarius.*

	Eng. Grains.
SUCH parts, or grains of the <i>English</i> standard for gold and silver (or of the <i>Troy</i> weight) as the <i>denarius Confularis</i> containeth sixty two, according to the weight of the best coins, or according to the weight of the <i>congius of Vespasian</i>	62 $\frac{1}{2}$
The ancient and modern <i>Roman</i> ounce containeth	438
The ancient and modern <i>Roman</i> pound, consisting of twelve ounces, containeth	5256
The <i>Troy</i> pound, or <i>English</i> standard of gold and silver, consisting of twelve ounces, containeth	5760
The <i>Troy</i> , or <i>English</i> ounce, (to which five shillings two pence of our money, in these times are equal) containeth	480
The <i>Paris</i> pound, or standard for gold and silver, of sixteen ounces	7560
The <i>Paris</i> ounce	472 $\frac{1}{2}$
The <i>Spanish</i> pound, or standard, for gold and silver, of sixteen ounces, taken by me at <i>Gibraltar</i>	7090
Another weigh'd by me at <i>Gibraltar</i>	7085
The <i>Spanish</i> pound in <i>Villalpandus</i> , is (I know not by what error) but	7035
The <i>Spanish</i> ounce at <i>Gibraltar</i> (the pound consisting of 7090 grains <i>English</i> )	443 $\frac{1}{2}$
The <i>Venetian</i> pound, or standard, for gold and silver, of twelve ounces	5528
The <i>Venetian</i> ounce	460 $\frac{1}{2}$
The <i>Neapolitan</i> pound, or standard, for gold and silver, of twelve ounces	4950
The <i>Neapolitan</i> ounce	412 $\frac{1}{2}$
The pound, or standard, for gold and silver, of twelve ounces, at <i>Florence</i> , <i>Pisa</i> , and <i>Legborne</i>	5286
The ounce at <i>Florence</i> , <i>Pisa</i> , and <i>Legborne</i>	440 $\frac{1}{2}$
The pound, or standard, at <i>Siena</i> , for gold and silver, of twelve ounces	5178
The ounce at <i>Siena</i>	431 $\frac{1}{2}$
The ounce at <i>Genoa</i> , for gold and silver	405 $\frac{1}{2}$
The <i>Turkish</i> okeb, or oke, at <i>Constantinople</i> , consisting of four hundred silver drams	19128
The silver dram generally used in the <i>Great Turk's</i> dominions: as also in <i>Persia</i> , and in the <i>Mogul's</i> countries, if I be not misinformed	47 $\frac{1}{2}$
The <i>Turkish</i> sultani, or <i>Egyptian</i> sherif, being a gold coin, with which the <i>Barbary</i> and <i>Venetian</i> chequeen, and <i>Norimberg</i> ducat, within a grain more or less, agree	53 $\frac{1}{2}$
The <i>ratel</i> , or <i>rotulo</i> , for gold and silver of a hundred forty four drams at <i>Cairo</i>	6886 $\frac{1}{2}$
The <i>ratel</i> , or <i>rotulo</i> , for silk of seven hundred and twenty drams at <i>Damascus</i> (with which I suppose they there formerly weighed their gold and silver; because most countries use the same weights for silks, gold, and silver)	34430 $\frac{1}{2}$

\* The weights (excepting the *rotulo of Damascus*) were diligently compared with the originals and standards; in like manner as I examined the measures above described. In both which, if any shall find some little difference from some originals, as five or six grains in the *English* pound, and it may be one or two parts of a thousand in the *English* foot, different from the standards in the *Exchequer*, or the *Tower*, or at *Winchester*, or some other place, it is not much to be wondered: for I have found as great differences in collating the *English* standards themselves: and have heard *Gaspard Berti* (one of the exactest men in this kind that I have known) to complain of the same diversity at *Rome*. And tho' it be a shame, that in any well-governed kingdom, or common-wealth, the standards, which are the rules of commutative justice, should be unequal, and therefore unjust; yet unless more art and circumspection be used, than hitherto hath been put in practice, it is impossible but such inequalities will creep in.

But this observation of mine, by some, may be thought too nice and curious. That which follows, I am certain, is as necessary, as the preservation of the life of many a man. And that is, that some physicians erroneously imagine the *granum auri* to be alike in all nations. And therefore *Fernelius*, a very able man (who, I think, was the first author of that opinion) writes thus: (*Fern. l. 4. c. 6. Method. medendi*) *Granum, cui tanquam basi reliqua innituntur pondera, ratum constansque esse debet; neque id granum esse bordei, neque tritici, neque cicris, neque frugis; ullius, aut leguminis, quod nullius par sit unico gentium pondus. At vero nummorum minutum, quod aurifabri granum appellant, & Latino momentum dici potest, omnibus mundi nationibus unum idemque est, & stabile, quod auri sacra famet, & opum furiosa libido, inviolata & incorrupta servat, idque signis & exemplaribus undique identidem collatis.* I indeed it was an useful fancy of his to think of some common measure, in which all nations might concur; tho' it is more to be wished for, than ever to be expected. But that alteration of his, *Inviolata, & incorrupta servat, idque signis & exemplaribus undique identidem collatis*, from a man of such rare abilities, I cannot but extremely wonder at: for if we shall go no farther to confute his assertion, than to compare our *grana auri* with those of *Paris*, which *Fernelius* used, we shall find ours much bigger: *xxix English* grains almost equalling *xxxvi of Paris*. Or if we shall compare the *Spanish grana auri*, with his, we shall find those much less: *xxxvi Spanish* grains weighing but *xxviii* and a half of his at *Paris*. The like could I demonstrate in those of other countries. By which dangerous and notable error, for want either of due care, or an exact balance, we may conceive that whatsoever also is delivered by the ancients, in the like nature, is not presently without due examination to be credited.

In this table I judged it much fitter to compare the *denarius* with the standards for gold and silver of several nations, than with their gold and silver coins now current. Because the pounds and ounces of the standard continue always the same; whereas the gold and silver coins being cut in several proportions, according to the exigencies of the state, admit of several alterations and diminutions.

## The CONCLUSION.

**G**RAVE: **I**T was my intention from the *pes Rom.* and *denarius*, together with the *cenius* of *Vespasian*, to have deduced the other weights and measures, used by the *Romans*; and from those of the *Romans*, by such testimonies as are upon record in the writings of the ancients, to have inferred those of the *Hebrews*, *Babylonians*, *Egyptians*, *Grecians*, and of other nations. A work, I confess, intricate and full of difficulties; wherein I could expect neither to give my self, nor others satisfaction, without first laying some sure and solid principles for the basis and foundation. Therefore that occasioned me to insist the more largely in the prosecution of the *pes Rom.* and *denarius*, and to examine all the ways I could possibly imagine, for the evident proof and confirmation of them. What in this kind I have done, and with how much truth and diligence, I leave to the impartial test of after-times, the rest at more leisure may be perfected. Yet these following observations, as a *coronis* to the whole work, I thought would not be unacceptable, if by way of anticipation I communicated them to the world: And those are how the originals and standards of weights and measures, notwithstanding the revolutions and vicissitudes of empires, may be perpetuated to posterity. Amongst several ways, which I have thought of, I know none more certain and unquestionable, than to compare them with some remarkable and lasting monuments, in remote countries, that have stood unimpaired for many hundred years, and are like to continue as many more. In which kind I made choice of the *first and most easterly* of the three great pyramids in *Egypt*; of the basis of that admirable Corinthian pillar, erected (as I suppose) by one of the *Ptolemys*, a quarter of a mile distant to the south from *Alexandria*, being one vast and entire marble-stone: of the rock at *Terracina* or *Anxur*, where it adjoins to the *Via Appia*, and almost touches the *Tyrrhene* sea: of the gate or entrance into the *Pantheon*, or temple of *Agrippa*, dedicated by him to all the gods, and by the Christians to all saints: of the *Porta Sancta*, in that new and exquisite structure of *St. Peter's church* in *Rome*. If the like had been attempted by some of the ancient mathematicians, our times would have been freed from much uncertainty, in discovering the weights and measures of the *Greeks* and *Latines*.

The first and most easterly of the three great pyramids in *Egypt*, hath on the north-side a square descent, when you are enter'd

a little past the mouth of it, there is a joint, or line, made by the meeting of two smooth and polished stones over your head, which are parallel to those under your feet, the breadth at that joint, or line, is three feet and  $\frac{1}{2}$  of the *English* foot.

Within the pyramid, and about the midst of it, there is a fair room, or chamber, the top of which is flat, and covered with nine small stones; in it there stands a hollow tomb of one entire marble-stone: the length of the south-side of this room at the joint, or line, where the first and second rows of stone meet, is thirty four feet  $\frac{1}{2}$ .

The breadth of the west-side of the same room at the joint or line, where the first and second row of stones meet, is seventeen feet  $\frac{1}{2}$ .

The hollow or inner part of the marble tomb, near the top, on the west side of it, is in length six feet  $\frac{1}{2}$ .

The hollow, or inner part of the marble tomb, near the top of it, on the north side, is in breadth two feet  $\frac{1}{2}$ .

The basis of the vast *Corinthian* pillar; about a quarter of a mile from *Alexandria* to the south, on the west-side of the pillar at *a b*, is in breadth twelve feet  $\frac{1}{2}$ . At *c d* it is fourteen feet  $\frac{1}{2}$ .

The rock at *Terracina*, or *Anxur*, near the *Via Appia*, close by the *Tyrrhene* sea, hath these figures, besides several others in the same perpendicular, very deeply engraven.

The uppermost line *b c*, over the figures *CXX*, in the innermost, and deepest part of the engraving, is in length four *English* feet, and  $\frac{1}{2}$ .

The

The lowermost lined *a* in the innermost, and deepest part of the engraving, is in length four feet  $\frac{1}{2}$ .

The stately gate or entrance into the *Pantheon*, or temple, built by *Agrippa* in *Rome*, the jambs, and top and bottom of it, being all of one entire marble-stone, is in breadth between the jambs, or sides, some three inches above the bottom, and some nine inches within, nineteen feet  $\frac{1}{2}$ .

The *Porta Sancta*, on the right-hand of the frontispiece of *St. Peter's* church in *Rome*, is in breadth on the pavement, or threshold, between the jambs or sides of the entrance, eleven feet  $\frac{1}{2}$ .

The great gate, or entrance, which is the middlemost of the five in the frontispiece of *St. Peter's* church in *Rome*, the doors of which are covered with leaves of brass, with very fair and exquisite figures, is in breadth, on the pavement, or threshold, between the jambs, or sides of it, eleven feet  $\frac{1}{2}$ .

The measures being fixed, we may likewise fix the weights in this manner; by making a vessel of a cubical figure, answerable to the proportion of any one of these feet, or palms, or braces, which are described in the table at the end of the first treatise. This cubical vessel being filled with clear fountain-water, we are to weigh

it with an exact balance, and to express the weight of it by some one of those weights, which we have placed in a table at the end of the second treatise. The side of this cube being known, and the weight of it in water defined, the rest of the weights in the second table, by way of consequence, by these proportions which we have assigned, may be discovered. Thus for example: the *Roman* foot described by *Villalpandus*, is nine hundred eighty six parts, such as the *English* foot contains a thousand: this being cubed (saith he) weighs of fountain-water eighty *Roman* pounds. If therefore there be given nine hundred eighty six parts of a thousand of the *English* foot, the cube of this will give us eighty *Roman* pounds in fountain-water; and consequently the other measures will be discovered by those proportions we have assigned to them, in respect of the *Roman* pound. Again, eighty *Roman* pounds of water being given, if we reduce this into a cubical body, the side of it will give the *Roman* foot described by *Villalpandus*: and consequently the other measures may be deduced by those proportions we have given them in a peculiar table. Whereby it appears, that as by measures weights may be preserved, so on the contrary, by weights measures may be restored.

#### Some Directions to be observed in comparing the Valuations of COINS.

IN comparing the valuations either of ancient coins with modern, or of modern one with another, we are to consider: first, the *intrinsic* of them, and then the *extrinsic*: the *intrinsic* is either the *fineness* of the coin, in respect of metal, or the *gravity* in respect of weight. The *extrinsic* I term, first, the *character* imprinted on the coin. And, secondly, the *valuation* enjoined by the prince, or state: by which character and valuation, what *originally* and *materially* was but common metal, or plate, comes now *legally* and *formally* to be current money. With these limitations, if we shall compare ancient coins with modern, and modern one with another, it will be no difficult matter to proportion out their several respective valuations; and wuhal to reconcile the seeming repugnancies, either of ancient coins now found, differing from the traditions of ancient authors, or the traditions of ancient authors differing among themselves.

I shall first give an instance of modern coins compared with modern, in our *English* money compared with that of *Spain*, as being most familiar to us; the application of which will by analogy serve for all other distinct states and times, using distinct coins.

In comparing therefore *English* money with *Spanish* money in *England*, or *Spanish* money with *English* in *Spain*, we are thus to proceed: First, We are to examine whether they be of a like fineness for the *intrinsic*; if they be, then an ounce of *English* money, and an ounce of *Spanish* (supposing the weight of the ounce to be alike) will be of like value in any other country out of *England* and *Spain*; where neither are current, but only considered as so much metal, or plate. Secondly, We are to consider the *extrinsic*, that is, the form and stamp of the coin, with the valuation of it by the injunction of the prince of either state; and here that which before was *equal*, comes now to be *unequal*: for an ounce of *English* money in *England* comes to be more worth than an ounce of *Spanish* money in *England*; because this wants the character, stamp, and valuation of our princes, whereby it is current: and for the same reason will an ounce of *English* money be less in valuation than the ounce of *Spanish* money in *Spain*, supposing (as I said) the ounce in both countries to be exactly one and the same.

The same analogy will be, if we compare ancient coins, as those of the *Hebrews*, *Greeks*, and *Romans*, with our *modern* coins.

We

GREAVES We are first to consider the *intrinsic* of them, whether they be of a like weight and fineness for the metal with ours: and this is the *natural or physical consideration*. From whence we may conclude, that if, for example, so many *Attick tetradrachmes* do equal in pureness and weight, so many of our *English* shillings, newly brought from the mint, or so many of our *Troy or silver ounces*, taken from the standard, then are they to be balanced with these in the acceptance of them as plate; and a silversmith, abstracting from the *extrinsic*, that were to melt them both, would give a like value for them both. But if we, secondly, look upon them with the image and character of the state, and in the notion of money, which is the *politick consideration*, then that which before in the *trutina*, and scale, was equal, in the *foro*, and in commerce, comes to be unequal: and an ounce of *English* money shall pass for more than an ounce in *Attick tetradrachmes*, with reference to the expences of the mint, and to the civil valuation, depending upon a mandate, or law, enacted by the prince.

In like manner will it be, if we compare ancient coins with ancient, made in different states, as it is in comparing ancient coins with modern.

Upon these grounds of reason it will follow, that whereas the *Roman* authors make the *denarius consularis* to be equal to the *drachma Attica*, and the *Greeks* equal the *drachma Attica* to the *denarius consularis*, that both say true; and yet both of them, if we speak strictly and exactly, may be deceived. For the *denarius consularis* examined by the balance, which is the best judge of the *intrinsic*, (I speak of the *intrinsic* in respect of weight, and not the *intrinsic* in respect of fineness, that being best discovered by the scale, and this by the test: which last, for the more clearness of my discourse, I suppose in all these coins to be alike.) I say, the *denarius consularis* is found by me, contrary to the opinion of all modern writers, to be lighter than the *drachma Attica*: and therefore to speak strictly, and precisely, cannot be equal to it in the *intrinsic*. But again, if we look upon the *extrinsic* of the *drachma Attica*, and *denarius consularis*, that having the stamp of *Athens*, and this of *Rome*, here reason must be our balance, and not the *trutina*. For the *Athenian* coin being a foreigner, and not current in *Italy*, in the way of exchange and commerce, will lose of its primitive valuation it had at *Athens*, and for want of the *extrinsic* of the *Roman*

stamp, necessarily rebate in the *intrinsic*. And therefore both *Greeks* and *Romans* writing in *Italy*, might truly say, that the *denarius consularis*, and *drachma Attica*, were equal, that is, speaking in civil commerce, and popular estimation: altho' they were unequal in the *intrinsic* and natural valuation.

But if we shall change the scene, and carry the *denarius consularis* to *Athens*, the case will be quite altered. For the *denarius* being a stranger, and the *drachma Attica* a denizen, that cannot have the same privileges with this: and therefore the *extrinsic* of the *denarius* being there of no use, and the *intrinsic* in respect of weight falling short of the *drachma*, it must necessarily be much less in valuation at *Athens* than the *drachma*: and I think no advised *Athenian*, writing in *Attica*, would make them equal, I am certain no nummularius would.

The same may be said of the *Hebrew shekel*, and the *Attick tetradrachme*, and of all other coins of distinct states, mention'd in classical authors. Thus *Philo* and *Josephus*, in *Judea*, both truly equal the *shekel* to the *Attick tetradrachme*, that is in way of commerce; tho' the *shekel* be unequal, and less than the *tetradrachme*, (as I have found by examining many of them) in a just notion of weight. The reason is evident by what hath been expressed before: for in *Judea* the *extrinsic* makes amends for what the *shekel* wants in the *intrinsic*; and on the contrary, what the *tetradrachme* exceeds in the *intrinsic*, is diminished for want of the *extrinsic*, till at length in a popular estimation they come to be equal. But the quite contrary would happen, in the transportation of *shekels* from *Jerusalem* to *Athens*. Here the *shekel* would necessarily fall from its primitive valuation, and the *tetradrachme*, being considered now no longer as a foreigner, would recover what it lost in *Judea*, and consequently rise above the *Hebrew shekel*; as having a double advantage in the *extrinsic* from the state, and in the *intrinsic* from its weight.

But what need we to go so far for examples, when as we instanced before, we have them nearer home? The *Spanish* quarters of the dollar, or double rials, pass ordinarily in our settlements but for shillings, (whereas they are worth in the *intrinsic* thirteen pence farthing) and our shillings pass in *Spain* scarce for a rial and an half. For theirs wanting in *England* our *extrinsic*, and ours in *Spain* wanting their *extrinsic*, must respectively rise and fall in their valuation.

AN  
ACCOUNT  
OF  
COCHIN-CHINA.

IN TWO PARTS.

The FIRST Treats  
Of the TEMPORAL STATE of that Kingdom.

The SECOND,  
Of what concerns the SPIRITUAL.

Written in ITALIAN,

By the R. F. CHRISTOPHER BORRI, a Milaneze, of the SOCIETY of JESUS, who was one of the First MISSIONERS in that Kingdom.

To the READER.

**T**HIS account is so short, it requires not much preface, or to say the truth, any at all; a little time sufficing the curious to inform himself of the value and contents of it. Who the author was appears by the title, and what the cause of his going into that kingdom, his profession and only business being to preach Christianity to the infidels: he lived five years among them, and learn'd their language to perfection; and therefore his relation is not like those of travellers, who just pass through a country; or merchants, that touch at ports upon the business of trade, and consequently deliver very fabulous accounts, either to make their travels the more surprizing, or for want of knowing better, taking things upon bear-say, and not understanding their language to get certain information. This father on the contrary frequently conversing with all sorts of people, and having a settled residence there for years, had the opportunity of knowing what he writ. He gives the description of the kingdom, a considerable part whereof he travell'd over: he speaks of its products, which he had the benefit of for sustenance and cloathing: he tells us the temper and seasons of the air, which he several times felt: he relates the inundations which he often saw: he gives an account of their sects, which he learn'd from their priests, or omfays, whom he converted to Christianity: he sets down the power and government of the kingdom which he could be no stranger to, being familiar with several men in great authority: and to conclude, he particularizes how far the christian faith was been there propagated, which he well knows, as having been himself a labourer in the vineyard for the first five years; and after that, receiving it from those that succeeded him. In fine, the relation is curious, too short, and seems to carry all the air of truth imaginable, besides the general approbation it has always received in all parts, which is the greatest commendation that can be given it.

BORRI.

The FIRST PART.

O F T H E  
Temporal State of the Kingdom of *Cochin-China*.

C H A P. I.

*Of the Name, Situation, and Extent of this Kingdom.*

BORRI.  
Name of  
*Cochin-  
China*.

**C**ochin-China, so call'd by the *Portugueses*, is by the natives call'd *Anam*, signifying a western country, because it lies west of *China*; for which same reason the *Japoneses* in their language give it the name of *Cocbi*, signifying the same as *Anam*, in the *Cochi-Chinese* Language. But the *Portugueses* having by means of the *Japoneses* been admitted to trade in *Anam*, of the *Japonesse* word *Cocbi*, and this other word *China*, compounded the name *Cochin-China*, applying it to this kingdom, as if they call'd it *Cochin* of *China*, the better to distinguish it from *Cochin* the city in *India*, inhabited by the *Portugueses*; and the reason why in the maps of the world we generally find *Cochin-China* set down under the denomination of *Cauchin-China*, or *Causchina*, or the like, is no other but the corruption of the right name, or that the authors of those maps would signify, that this kingdom was the beginning of *China*.

Its bounds This kingdom on the south borders upon that of *Chiampá*, in 11 degrees of north latitude, on the north somewhat inclining east-ward with *Tunchim*, on the east is the *Chinese* sea, and on the west north west the kingdom of *Lais*.

Extent. As to its extent, I shall here speak only of *Cochin-China*, which is part of the great kingdom of *Tunchim*, usurp'd by a king who was grandfather to him now reigning

in *Cochin-China*, who rebell'd against the great king of *Tunchim*: for as yet the *Portugueses* have traded only in this province; and here only the fathers of the society have been conversant, in order to introduce Christianity: yet at the end of this account, I shall discourse concerning some particulars of *Tunchim*, where our fathers got footing since my return into *Europe*.

*Cochin-China* extends above a hundred leagues along the sea, reckoning from the kingdom of *Chiampá*, in the aforesaid 11 degrees of north latitude, to the gulf of *Anam*, in the latitude of 17 degrees, or thereabouts, where the king of *Tunchim*'s dominions begin. The breadth is not much, being about twenty miles, all the country plain, shut up on the one side by the sea, and on the other by a ridge of mountains inhabited by the *Kemois*, which signifies a savage people; for tho' they are *Cochin-Chinese*, yet they no way acknowledge or submit to the king, keeping in the fastnesses of the uncouth mountains, bordering on the kingdom of *Lais*.

*Cochin-China* is divided into five provinces, the first bordering on *Tunchim*, where this king resides, is call'd *Sinuvá*; the second *Cachiam*, here the prince, the king's son resides and governs; the third, *Quam-guya*; the fourth *Quignin*, by the *Portugueses* call'd *Pullucambi*; and the fifth confining on *Chiampá*, is *Renran*.

C H A P.

## CHAP. II.

## Of the Climate, and Nature of the Country of Cochin-China.

**T**HIS kingdom, as has been said, lies between 11 and 17 degrees of north latitude; hence it follows of course, that the country is rather hot than cold, and yet it is not so hot as *India*, tho' it be in the same latitude, and within the torrid zone. The cause of the difference is, because in *India* there is no distinction of the four seasons of the year, so that the summer lasts there nine months without intermission, without feeling so much as a cloud either day or night, and therefore the air is continually, as it were, inflamed with the great reflection of the sun-beams. The other three months are call'd winter, not because there is any want of heat, but because at that time it generally rains day and night; and tho' to appearance, such continual rains should naturally cool the air, yet they falling in the three months of *May*, *June*, and *July*, when the sun is in its greatest elevation, and in the zenith of *India*, and no winds blowing but what are hot, the air continues so inflam'd, that sometimes the heat is more intense than in summer, when for the most part there are pleasant winds blowing from the sea, which cool the ground, wherewith, if Almighty God did not relieve those countries, they would be uninhabitable.

Great heat of India.  
Four seasons in Cochin-China.

But *Cochin-China* enjoying the distinction of the four seasons, tho' not in so perfect a manner as *Europe*, is much more temperate: for tho' its summer, which comprehends the three months of *May*, *June*, and *July*, be violent hot; because it lies within the torrid zone, and because the sun is then in its zenith, yet in *September*, *October*, and *November*, the autumn season, the heat ceases, and the air becomes very temperate by reason of the continual rains, which at this time usually fall upon the mountains of the *Kemois*, whence the waters running down in abundance do so flood the kingdom, that meeting with the sea, they seem to be all of a piece. These inundations during these three months, for the most part happen once a fortnight, and last three days at a time. They serve not only to cool the air, but to fertilize the earth, making it fruitful and abounding in all things, but particularly in rice, which is the most common and universal food of all the kingdom. During the other three winter months, which are *December*, *January*, and *February*, there are cold northerly winds, bringing cool rains, and so sufficiently distinguishing the winter from other seasons. To conclude, in *March*, *April*, and *May*, the effects of spring appear, all things being green

and blossoming.

Now since we have spoke of these inundations, I will not conclude this chapter without first observing some curiosities that occur on occasion of them.

The first is, That all men in general wish for them, not only that they may cool the air, but much more for the fertilizing of the earth: for which reason as soon as they appear, all the people are so pleas'd and joyful, that they express it by visiting, feasting, and presenting one another, all of them crying, and often repeating, *Daden Lut*, *Daden Lut*; that is, the inundation is come, it is here: and this is done by persons of all degrees, even to the king himself.

And in regard the inundations often come so unexpectedly, that very often when they do not think of it at night, they find themselves the next morning surrounded with water; so that they cannot go out of their houses, throughout the whole kingdom, as has been said: hence it is that abundances of cattle are drowned, for want of time to retire to the mountains, or higher grounds. For this reason there is a pleasant sort of law throughout the kingdom; which is, that if oxen, goats, swine, or other beasts, are drowned, the owner loses them, and they belong to him that first takes them: which causes much sport and jollity; because when the *Lut* happens, they all go out in boats, to seek the drowned cattle; upon which they afterwards feast and treat one another.

Nor are the younger sort without their Beneficial pastime; for there being in those fields of rice, an infinite number of rats, their nests filling with water, they are forced to swim out, and get upon the trees to save themselves: and it is pleasant to see the boughs loaded with rats, like fruit hanging on them. Then do the boys run out in their boats, striving to out-do one another, in shaking the trees, that the rats may fall and be drowned: which childish pastime is wonderful beneficial to the country, delivering it from those mischievous creatures, that otherwise, by degrees, would devour all the harvest.

In short, the *Lut* causes another considerable advantage: which is, that it affords every body the opportunity of furnishing his house with all necessaries, because the country being all navigable, during these three days, commodities are very easily convey'd from one city to another, and therefore then are held the greatest fairs and markets,

Beneficial inundations.

A pleasant law.

Beneficial pastime.

Markets and fairs on the water.

**BORRI.** kets, and with greater concourse of people than at any other time in the year. Then also it is, that they lay in provision of wood to burn and build, bringing it from the mountains in boats; which to this purpose come into the streets, and into the very houses, built for this purpose upon high

pillars, that water may have free passage, the people living during that time in the upper floors; to which it were a wonder if the *Lut* should ever rise, they being built according to the situation of the place, to such a height as they know by long experience, is sufficiently above the waters.

### CHAP. III.

#### Of the Fruitfulness of the Country.

**Rice.** IT is an easy matter to conceive the fertility of *Cochin-China*, by the advantages accruing from the *Lut*; yet we will mention some other particulars relating to it. The *Lut* leaves the land so fruitful, that rice is gathered three times a year, in such great plenty and abundance, that there is no body will work for gain, all persons having enough to live on plentifully.

**Oranges.** There are great quantities of fruit of several sorts, all the year about; and they are the same with those in *India*, *Cochin-China* being within the same climate. But to come to particulars; the oranges there are bigger than ours in *Europe*, and very full; the rind of them is thin, tender, and so well tasted, that it is eaten with the juice, which has a pleasant relish like lemons in *Italy*.

**Banana's.** There is a sort of fruit which the *Portuguese* call *banana's*, and others *Indian figs*; tho', in my judgment, the name of a fig is neither proper to those in *India*, nor in *Cochin-China*, because neither the tree nor fruit has any resemblance with our figs, the tree being like that we call *Indian Wheat*, but higher, and the leaves so long and broad, that two of them would serve to wrap a man in quite round, and from head to feet. Hence some have taken occasion to say, that this was the tree in paradise, with the leaves whereof *Adam* cover'd himself. This tree at the top produces a cluster of twenty, thirty, or forty of these *banana's* together; and each of them is in shape, length, and thickness, of an indifferent citron in *Italy*. Before the fruit is ripe, the rind is green; but afterwards yellow, as the citrons are. There is no need of a knife to pare this fruit, for the rind comes off as we shell beans. This fruit has a most fragrant smell; the pith or flesh of it is yellow, and firm, like that of a *bergamot* pear, when full ripe, that melts in the mouth. By this it appears to be no way like our fig, except in the taste and sweetness. There is another sort of them, which is only eaten roasted, and with wine: the stem dies every year, when it has produc'd the fruit, and leaves a young sprout at the foot, which grows up against the next year. That which in *Italy* they call

an *Indian fig*, is nothing like the plant, or fruit of this *banana*, we now speak of; nor is this which we have in *Italy* call'd an *Indian fig*, in those parts. This fruit is common throughout all *India*. There is another sort in *Cochin-China*, that is not found in *China*, nor *India*: it is as big as the largest citrons we have in *Italy*; so that one of them is enough to satisfy a man. These are nourishing, very white within, and full of black round seeds, which chew'd together with the white substance, are of a delicious taste, and a good medicine against the flux.

There is another fruit in *Cochin-China*, which I have not seen in any other country of *India*; and this they call *Can*: the outward form and nature of the rind is like our pomegranate; but within it contains a substance almost liquid, which is taken out, and eaten with a spoon; the taste is aromatick, and the colour like that of a ripe medlar.

They have another peculiar to the country, *Gaoi*, that grows, and is like our cherries, but tastes like raisins, and is call'd *gnoo*.

There are also melons, but not so good Melons: as ours in *Europe*; nor are they eaten without sugar or honey. The water-melons are large and delicate.

There is a fruit they call *giacca*, which *Giacca* is common to the other parts of *India*, but much larger in *Cochin-China*: It grows on a tree as high as the walnut, or chestnut, and has much longer prickles than the *jubeb*. It is as big as a very large pompon in *Italy*, so that one of them is a man's load. The out-rind is like that of a pine-apple, but soft and tender within. This fruit is full of certain yellow round kernels, like a small piece of coin, that is round and flat; and in the middle of every one of them, is a stone that is thrown away. There are two sorts of this fruit; one in *Portuguese* is call'd *giacca barca*: the stone of this is thrown away, and the pulp is stiff; they do not take out the stone of the other; nor is the pulp hard, but soft as glue: both these in taste somewhat resemble that delicious fruit called the *durian*, whereof we shall speak next.

This *durian* is one of the most delicious fruits in the world, and only found in *Malacca*,

*laca*, *Borneo*, and the adjacent islands. The tree differs little from the *giacca* last mentioned, and the fruit it self is like it without, and that resembles the pine-apple, even in the hardness of the rind. The meat within is very white about the bone, to which it sticks like glue, and tastes very like our *mangiare bianco* (a dainty among the *Italians*.) This meat and liquor is divided into ten or twelve little apartments, in each of which the flesh and moisture is about its stone, which is as big as a large chestnut. And it is to be observ'd, that when they break open the shell of this fruit, there comes from it an ill scent, like that of a rotten onion, all the substance within remaining of a most sweet and unexpressible flavour, whereupon I will relate what happened in my presence: a prelate arriv'd at *Malacca*, and one there opened a *durian* before him to give him a taste; the prelate was so offended at that nausous smell that came from it when broke, that he would not taste it by any means. Being afterwards set down to dinner, they gave the rest of the company *mangiare bianco*; but on this prelate's plate they laid the white substance of this fruit, which is so like the *mangiare bianco*, that he could not distinguish the difference by the sight. The prelate tasted it, and thought it so much more delicious than usual, that he ask'd, what cook dress'd it so rarely? Then he that had invited him to dinner, smiling, told him, It was no other cook but God himself, who had produc'd that fruit, which was the very *durian* he would not taste. The prelate was so astonish'd, that he thought he could never eat enough; and they so dear, that even at *Malacca*, where they grow, they sometimes cost a crown apiece.

*Ananas.* *Cochin-China* abounds in another sort of fruit, by the *Portugueses* call'd *ananas*; which tho' it be common to all *India*, and *Brazile*, yet because I have not found it well describ'd by those that have writ of it, I would not pass it by. This fruit does not grow on a tree, nor from a seed, but on a stalk, like our artichokes, and the stem and leaves are much like those of the thistle or artichoke. The fruit is like a cylinder, a span long, and so thick that it requires both hands to grasp it. The pulp within is close, and like a radish, the rind somewhat hard, scaly like a fish. When ripe, it is yellow both within and without, is par'd with a knife, and eaten raw, the taste of it an eager sweet, and as soft as a full-ripe bergamot-pear.

*Areca.* There is besides, in *Cochin-China*, a fruit peculiar to that country, which the *Portugueses* call *areca*. The trunk of it is as trait as a palm-tree, hollow within, and produces leaves like those of the palm, on-

ly at the top among these leaves, there *BORRI.* grow some small boughs, which bear the fruit in shape and bigness like a walnut, green without just as the nut is; within it is white and hard like a chestnut, and has no taste at all. This fruit is not eaten alone, but is wrapp'd up in leaves of *belle*, well known in *India*, which are like our ivy-leaves in *Europe*, and the plant it self clings to trees like the ivy. These leaves are cut in pieces, and in them they wrap a bit of *areca*, each of them making four or five morsels; and with the *areca* they put some lime, which is not there made of stone, as in *Europe*, but of oyster-shells; and as among us there are cooks and caterers, &c. so in *Cochin-China* there is one in every family, whose business is to wrap up these morsels of *areca* in *belle*, and these persons being women, are call'd *Betteres*. They fill their boxes with these morsels, and chew them all day, not only when they are at home, but when they are walking, or talking, at all times, and in all places, never swallowing, but spitting them out when they are well chew'd, retaining nothing but the relish and virtue of it, which wonderfully comforts the stomach. These morsels are so much in use, that when one of them goes to make a visit, he carries a box full of them, and presently presents some of the party visited, who claps it into his mouth; and before the visitor departs, he that is visited sends to his *Better*-woman for a box of the same, and presents it to the visitor, to return his kindness; and these morsels must be still making. And there is so much of this *areca* us'd, that the greatest revenues of that country come from the fields of it, as among us of olive-gardens, and the like.

*Tobacco* is also us'd there, but not so much Other as *belle*. The country also abounds in all growth. sorts of pumpions and sugar canes. The *European* fruits are not yet come thither; but I believe grapes and figs would take very well. Our herbs, as lettuce, endive, colworts, and the like, come up well in *Cochin-China*, as they do throughout all *India*: But they grow into leaf, without producing any seed, so that it must be still supplied out of *Europe*.

There is also great plenty of flesh, by reason of the great multitude not only of tame cattle, as cows, goats, swine, buffaloes, and the like; but of wild, such as deer, much bigger than those of *Europe*, wild boars, &c. and of hens both tame and wild, of which sort the fields are full, turtles, pigeons, ducks, geese, and cranes, which are savory enough; and in short, other sorts, which we have not in *Europe*.

Their fishery is very great, and fish so delicious, that tho' I have travell'd so many

**BORRI.** countries, I do not think I have met with any to compare to that of *Cochin-China*. And the country, as was said before, lying all along upon the sea, there are so many boats go out a fishing, and they bring in so much fish to all parts of the kingdom, that it is really very remarkable to see the long rows of people continually carrying fish from the shore to the mountains; which is duly done every day, for four hours before sun-rising. And tho' generally among the *Cochin-Chineſes*, fish is more valu'd than flesh, yet the main reason why they apply themselves so much to fishing, is to furnish themselves with a kind of sauce, which they call *balacchiam*, which is made of salt fish macerated and steeped in water. This is a sharp liquor, not unlike mustard, whereof every body lays in such store, that they fill barrels and tubs of it, as many in *Europe* lay in their stocks of wine. This of it self is no food, but serves to sharpen the appetite to the rice, which they cannot eat without it. For this reason, tho' rice be the general and most common sustenance in *Cochin-China*, there must be vast quantities of *balacchiam*, without which it is not eaten, and consequently there is continual fishing. There is no less plenty of shell-fish, oysters, and other product of the sea, especially of one sort, which they call *cameron*. (I suppose this to be the *Portuguese* word *camerano*, signifying shrimps, or prawns.)

Besides all this, providence has furnish'd them with a sort of food so rare and delicate, that in my opinion it may be compar'd to the *manna*, wherewith the chosen people of God were fed in the desert. This is so peculiar to *Cochin-China*, that it is no where else to be found: and I will give an account of what I know of it by experience, and not by hear-say, having seen and eaten of it several times.

In this country there is found a small bird like a swallow, which fastens its nest to the rocks, the sea-waves break against. This little creature with its beak, takes up some of the foam of the sea, and mixing it with a certain moisture it draws from its own stomach, makes a sort of slime, or bituminous substance, which serves to build its nest, which when dry and hardened, remains transparent, and of a colour between green and yellow. The country people gather these nests, and being soften'd in water, they serve to season meat, whether fish, flesh, herbs, or any sort whatsoever; and give every thing so different a relish, and so proper to it, as if they had been season'd with pepper, cinnamon, cloves, and the richest spice; this nest alone being enough to season all sorts of provisions, without salt, oil, bacon, or any other addi-

tion; and therefore I said I thought it like manna, which had in it the taste of all the most delicious meats; saving that this is the work of a small bird, and that was made by God's angels. And such great store of them is found, that I my self saw ten small boats laden with nests, taken among the rocks, in not above a mile's distance. But they being so precious a commodity, only the king deals in them, they being all kept for him; and his greatest vent is to the king of *China*, who values them at a great rate.

They eat no sort of white meats, looking upon it as a sin to milk the cows, or other creatures: and the reason they give for this nicety, is, that milk was by nature appointed for sustenance of the young ones: as if the owner of the young ones could not dispose of their sustenance. They eat some things which we loath, and count venomous, as camelions, which are here somewhat bigger than those that are sometimes brought dry'd up into *Italy*, out of other countries. I saw a friend buy five ty'd together in a cluster, and lay them upon the live coals, which having burn'd the string, they walk'd about gently, as they used to do till they felt the heat of the fire; which being of a violent cold nature, they resisted a-while, but were at last broil'd: my friend took them up, and scraping off the burn'd skin with a knife, the flesh remain'd extraordinary white; then he bruise'd and boil'd them in a certain sort of sauce like butter, and then eat them as a great dainty, inviting me to bear him company: but I had enough with the sight of it.

*Cochin-China* abounds in all other things necessary for the support of human life; and in the first place for cloathing: there is such plenty of silk, that the peasants and mechanicks generally wear it; so that I was often pleas'd to see men and women at their labour, carrying stone, earth, lime, or the like, without the least fear of tearing or spoiling the rich cloaths they had on. Nor will they wonder at it, who shall know, that the mulberry-trees, whose leaves feed the silk-worms, grow in vast plains, as hemp does among us, and run up as fast; so that in a few months the said worms appear upon them, and feed in the open air, spinning their thread at the proper time, and winding their bottoms in such plenty, that the *Cochin-Chineſes* have not only enough for their own uses, but they furnish *Japan*, and send it into the kingdom of *Lais*, whence it afterwards spreads as far as *Tibet*; this silk being not so fine and soft, but stronger and more substantial than that of *China*.

The structures the *Cochin-Chineſes* use of wood, are nothing inferior to those of any other part of the world; for without falsifying,

Wonderful nests.

Incorruptible trees call'd tin.

The houses.

Aquila, and calamba, or doriferous wood.

falsifying, this country has the best timber in the universe, in the opinion of all that have been there to this time. Among the variety and multitude of their trees, there are two that most usually serve for building, and are so incorruptible, that they do not decay in the least, either under ground, or under water; and they are so solid and heavy, that they do not swim upon the water, and a log of them serves instead of an anchor to a ship. One of them is black, but not so as ebony; the other is red, and both of them, when the bark is taken off are so smooth and slick, that they scarce need any planing. These trees are call'd *tin*; and they would not deviate much from the truth, who should say, they were that incorruptible wood, which *Solomon* made use of for building the temple: for we know the scripture gives them a name much like this, calling them *ligna thyria*. The mountains of *Cochin-China* are all full of these trees, all frant, of such a prodigious height, that they seem to touch the clouds, and so thick that two men cannot fathom them. Of this timber the *Cochin-Chinese* build their houses, every man being free to cut down as many as he pleases.

The whole fabrick of their houses rests upon high, solid, and well settled pillars, between which they place boards to remove at pleasure; either to exchange them for cane-lattices, which they weave neatly, to let in the air in hot weather; or to leave a free passage for the water and boats, at the time of the inundation, as we observ'd above. They have also a thousand curious inventions, and ingenious contrivances to set off their houses, with carving, and other works on wood, which are a very great ornament.

Since we have begun to talk of the trees, before we proceed upon any other matter, I will here mention something of a sort of wood, accounted the richest commodity that can be carried out of *Cochin-China* to other parts; which is the most famous wood call'd *aquila*, or eagles-wood, and *calamba*; which are the same thing as to the tree, but differ in their value and vertue. Of these trees, which are thick and high enough, the *Kemois* mountains are very full; if the wood be cut off a young tree, it proves *aquila*, or eagle-wood, and this there is most plenty of, every one cutting as much as he can: but when the wood is of an old tree, that proves *calamba*; which were very hard to be found, had not nature it self provided for it, causing these same trees to grow on the tops of unaccessible mountains, where growing old without being expos'd to destruction, some boughs of

them now and then drop down, breaking off either for want of moisture, or through age, and are therefore found rotten and worm-eaten, infinitely exceeding the common *aquila*, or eagle-wood, in vertue and sweet scent; and this is the so highly valuable and famous *calamba*. The *aquila* is sold by any body, but the *calamba* belongs only to the king, because of the high value of its perfume and vertue. And to say the truth, it is so sweet where they gather it, that some pieces being presented me, for a trial, I buried them above a yard and a half under ground, and yet they discovered themselves by their fragrancy. The *calamba*, where taken, is worth five ducats a pound; but in the port of *Cochin-China*, where the trade is, it bears a much greater price, and is not sold under sixteen ducats a pound. In *Japan* it is worth two hundred ducats a pound; but if there be a piece big enough for a man to lay his head on like a pillow, the *Japaneses* will give after the rate of three or four hundred ducats a pound: the reason of it is, because they instead of a soft down-pillow, when they sleep, lay their head on some hard thing, and generally it is a piece of wood, which every one according to his ability endeavours to have of as great value as can; and a piece of *calamba* is look'd upon as a pillow fit for none but a king, or some great lord. Yet the *aquila*, tho' of less price and esteem than the *calamba*, is so considerable, that one ship's load of it, enriches any merchant for ever: and the best advantage the king can allow the governor of *Malacca*, is to grant him one voyage of *aquila*; because the *Brachmans* and *Banians* of *India*, using to burn their dead with this sweet wood, the consumption of it is continually very great.

To conclude, *Cochin-China* abounds in rich mines of the most precious metals, especially of gold: and to reduce to a few words, what might be said more at large of the plenty of this country, I will conclude with that which the *European* merchants trading thither commonly say of it; which is, that in some measure the wealth of *Cochin-China* is greater than that of *China* it self; and we all know how rich that country is in all respects.

I ought in this place to say something of the beasts, whereof we before observ'd there was great variety and numbers in *Cochin-China*: but that I may not dilate too much, I will only treat of the elephants and abadas, or rhinocero's, chiefly found here; of which many curious things may be said, which perhaps very many have not heard of.

C H A P.

## CHAP. IV.

## Of the Elephants and Abadas, or Rhinocero's.

**BORR.** **T**HERE are abundance of elephants in the woods of *Cochin-China*, which they make no use of, because they know not how to take, or tame them: therefore they bring them tame and well taught from *Cambogia*, a neighbouring kingdom. These are twice as big as those of *India*, the round print of their feet they leave behind them, is not less than half a yard diameter; the two teeth striking out of the mouth, whereof ivory is made, are very often four yards and a half long; that is, those of the males, for those of the females are much shorter; by which it is easy to compute, how much those elephants of *Cochin-China* are bigger than those shewn about in *Europe*, whose teeth are not above three quarters of a yard long. The elephants live many years; and I asking, how old one might be? The driver of it told me, It was sixty years old before it came from *Cambogia*, and had lived forty in *Cochin-China*: and having myself several times travell'd upon elephants in that kingdom, I can relate many things that will seem strange, but yet are very true.

Elephants  
their age.

They carry  
by land  
and water.

An elephant generally carries thirteen or fourteen persons, who are thus dispos'd of: as we lay a saddle on a horse, so they clasp a certain machine upon the elephant, which is like a coach, wherein there are four seats; it is fastned with chains under the elephant's belly, as a horse's saddle is girt. The coach has two doors on the sides, where six persons sit, three on a side; and another behind, where there are two more; and lastly, the *nayre*, who supplies the place of a coachman, sits over the elephant's head, and guides him. Nor have I travell'd in this manner by land only, but very often by sea too, crossing arms of it above a mile over: and it was wonderful to any body that knew it not before, to see such a vast great lump of flesh swimming under such a weight, so that it look'd like a boat rowing. True it is, the beast groan'd under the toil, occasion'd by the unreasonable bulk of its own body, and the difficulty of breathing; and therefore to ease it self in that pain, it suck'd in water with the trunk, and spouted it out so high, that it look'd like some great whale gliding along the ocean.

They help  
up passengers.

For the same reason of its mighty corpulency it finds much difficulty in stooping down; and this being absolutely necessary for the conveniency of passengers to get up to, or down from the coach, he does it not but when commanded by the *nayre*; and if

when he is kneeling, any one stops but never so little, upon ceremony, or any other account, he rises up, not having patience to continue in that posture, it is so painful.

Nor is it less wonderful to behold, how at the *nayre's* command, he makes, as it were, a ladder of his limbs, for the greater conveniency of those that are to get up into the coach: the first step is his foot, which is high enough; for the second, he turns out the first joint above the same foot, distant enough from the other; for the third, he bends his knee; for the fourth, his hip-bone, sticking out to that purpose; and from whence, he that gets up, lays hold of a chain fastned to the coach it self, where he seats himself.

By this it plainly appears, how much they are mistaken, who say and write, that the elephant can neither kneel nor bow down; and that the only way to take him, is to cut the tree he leans against to sleep: for that falling together with the false support, and not being able to rise, he becomes a certain prey to him that lies in wait: which is all a fable, tho' it be true that he lies not down to sleep, that being an uneasy posture to him, as has been said, but sleeps always standing, with a continual agitation of his head.

Upon occasion of war or battle, they take off the roof of the coach, whence, as it were from a tower, the soldiers fight with muskets, arrows, and sometimes a small piece of cannon, the elephant being strong enough to carry it, his strength being answerable to all the rest: and I have seen one myself, that would carry vast weights upon his trunk; and another that lifted up a great piece of cannon with it; and another, who by himself launch'd ten galliots one after another, taking hold of them very dexterously with his teeth, and shoving them into the sea. I have seen others pull up large trees with as much ease we do a cabbage, or a lettuce: with the same ease they throw down houses, levelling whole streets when they are commanded, either to do harm to an enemy in war, or to stop the fury of the flames upon occasion of any fire.

The trunk's length is proportionable to the height of the rest of his body, so that he can take up any thing off the ground without stooping. It is made of abundance of small sinews knit together, which makes it so pliable, that he can take up the least thing, and yet so strong and firm as we have shewn.

All the body is covered with a rough ash-colour skin. An elephant's usual day's journey is twelve leagues, and his motion has the same effect upon those that are not used to it, as that of a ship has at sea.

Great  
sense of  
the ele-  
phant.

I shall say nothing more wonderful concerning the elephant's docility, or aptness to learn, than what is generally reported; by which it will appear, there was reason to say, *No beast was more sensible than the elephant*: for it does such things as seem to be the acts of prudence and understanding. In the first place, though the *mayre* makes use of a certain instrument of iron a yard long, which has a hook at one end, wherewith he strikes and punces him, that he may be watchful, and mind what he bids him do, yet for the most part, he governs him only by words: by which it appears he understands the language very well; and some of them understand three or four that are very different, according to the several countries they have lived in. Thus he that I travelled on, seemed to understand the language of *Cambogia*, whence he came, and that of *Cochin-China*, where he was. And who would not admire to hear the *mayre* discourse with his elephant, tell him the way and road he is to take, what place he is to pass by, what inn they are to lie at, what they shall there find to eat; and in short, give him an exact account of all that is to be done during the journey? and to see the elephant perform what he expects from him, as regularly as any man of good sense could do: inasmuch, that when the elephant seems to have understood what place he was to go to, he takes the shortest cut to it, without minding the beaten road, rivers, woods, or mountains, but goes on, not doubting to overcome all difficulties, as in effect he does: for if any rivers be in the way, he either fords or swims them; if woods, he breaks the boughs of the trees, pulls them up whole, or cuts them with a sharp iron like a scythe, which to this purpose is fastened to the fore-part of the top of the coach, wherewith upon occasion having first laid hold of the boughs, he cuts them with his trunk, and makes himself way, cutting through the thickest forest, where it is easily known to have been an elephant that made the way: and all this he does with great ease and expedition, in obedience to the *mayre*.

The ele-  
phant un-  
derstands  
what is  
said.

One only thing disturbs this creature, and puts it to great pain; which is, when a thorn, or such like thing, runs into the bottom of his foot, which is extraordinary soft and tender, and therefore he treads very cautiously, when he goes thro' places where there may be danger of such an accident. I went a journey once with seven

Vol. II.

or eight elephants in a company, and heard *BORRI*, the *mayre*, every one warn his own beast, to look out carefully where he set his feet: for they were to pass over a sandy place about a mile in length, where thorns grew up among the sand; upon this intimation all the elephants held down their heads, and looking out, as it were, for some small thing that is lost, they walk'd that mile very cautiously, step by step; till being told there was no more to fear, they lifted up their heads, going on as they had done at first. Being come at night to the inn, the *mayres* sent the elephants to the wood to feed, without taking the coach off their backs; and I asking, why they did not take it down: They answered, That the elephants fed on the boughs of trees, and therefore they left the coach on their backs, that they might cut them with that iron we said was before it. The next day being come where there was no wood, every *mayre* carried a large bundle of green boughs for his elephant. I took particular satisfaction to observe one, who more nimbly than the rest, laying hold of those boughs with his trunk, barked them with his teeth, and then eat them up as quick, and with as good a gust, as we would a fig, or any other sort of fruit. Discouraging the next day with my fellow-travellers, who were about twenty, I told them, how much I was pleased to see that elephant eat the boughs so cleverly. Then the *mayre*, by order of the elephant's master, called him by his name, which was *Gnin*, he being at some distance, but presently lifted up his head to give ear to what was said to him. Remember, said the *mayre*, that father, the passenger that looked upon you yesterday, when you was eating; take such a bough as one of them was, and come before him, as you did yesterday. No sooner had the *mayre* spoke the words, but the elephant came before me with a bough in his trunk, singling me out among all the company, shew'd it me, bark'd, and eat it; then inclining himself very low, he went away, as it were, laughing, making signs of joy and satisfaction; leaving me full of astonishment, to see that a beast should be so apt to understand, and do what it was commanded. Yet the elephant is obedient to none but the *mayre*, or his master; and he will only endure to see them get upon him: for if he should see any other person mount, there were danger that he would throw down the coach with his trunk, and kill him: and therefore when any body is to get up, the *mayre* generally covers his eyes with his ears, which are very large and ill shap'd.

If at any time the elephant does not obey so readily as he should, the *mayre* beats are corrected. him cruelly on the middle of his forehead.

8 Z

standing

**BORRI.** standing himself all the while upright on his head: One time when I was upon him, with several others, the *nayre* beat him, as has been said, and every stroke he gave him, it looked as if we should have been all thrown down headlong. Generally they give him six or seven strokes on the middle of the forehead; but with such force, that the elephant quakes and yet bears all patiently. There is only one time when he obeys neither the *nayre*, nor any other body; which is when on a sudden he is inflamed with lust: for then, being quite besides himself, he bears with no body, but lays hold of the coach with all that are in it, killing, destroying, and beating every thing to pieces. But the *nayre* by certain signs discovers it a little before it comes, and getting down speedily with all the passengers, unloads him, taking down the coach, and leaves him alone in some by-place, till that fury be over: after which, being sensible of his error, and as it were ashamed of himself, he goes with his head low to receive the blows that are to be given him, thinking he has deserved them.

Now useful in war

Formerly the elephants were of great use in war, and those armies were formidable that carried great troops of them into the field; but since the *Portugueses* found out the way of using artificial fireworks to them, they are rather hurtful than otherwise: for not being able to endure those sparks of fire which get into their eyes, they betake themselves to flight, breaking their own armies, killing and confounding all that stands in their way.

The Rhinoceros.

The tame elephant fights with only two creatures, which are the wild elephant, and the abada, or rhinoceros; the latter it overcomes, by the first is generally conquered. The rhinoceros is a beast of shape between a horse and an ox, but as big as one of the smallest elephants, covered all over

with scales, as it were so many plates of armour. He has but one horn in the middle of the forehead, which is straight and pyramidal, and his feet and hoofs are like those of an ox. When I was at *Nuocmon*, a city in the province of *Pulucambi*, the governor went out to hunt a rhinoceros, that was in a wood near our dwelling place. He had with him above an hundred men, some a foot, and some a horseback, and eight or ten elephants. The rhinoceros came out of the wood, and seeing so many enemies, was so far from giving any tokens of fear, that it furiously encountered them all; who opened and making a lane, let the rhinoceros run through: It came to the rear, where the governor was a top of his elephant, waiting to kill it: the elephant endeavours to lay hold with his trunk, but could not by reason of the rhinoceros's swiftness and leaping, that striving to wound the elephant with its horn. The governor knowing it could receive no hurt, by reason of the scales, unless they struck it on the side, waited till leaping it laid open the naked place, and casting a dart, dexterously struck it through from side to side, with great applause and satisfaction of all the multitude of spectators; who without any more to do, laid it upon a great pile of wood, setting fire to it, leaped and danced about, whilst the scales were burning, and flesh roasting, cutting pieces as it roasted, and eating them. Of the entrails, that is the heart, liver, and brain, they made a more dainty dish, and gave it to the governor, who was upon a rising ground, diverting himself with their merriment. I being present obtained the hoofs of the governor; which are looked upon to have the same quality and virtue, as the claws of the great beast (or the hoof of the elk) and so the horn is good against poison, as is the unicorn's.

## CHAP. V.

*Of the Qualities, Customs, and Manners of the Cochin-Chineses; of their way of Living, their Habit and Cures.*

Colour and disposition of body of the Cochin-Chineses.

**THE** *Cochin-Chineses* are in colour like the *Chineses*; that is, inclined to an olive-colour: I mean those that are nearest the sea; for those up the inland, as far as *Tonchin*, are as white as the *Europeans*. The shape of their faces is exactly like the *Chineses*, with flat noses, little eyes, but of an indifferent stature, not so small as the *Japoneses*, nor so tall as the *Chineses*. Yet they are stronger and more active than either of them, and braver than the *Chineses*, but are out-done by the *Japoneses* in one thing, which is the contempt of life in dangers and battles; the *Japoneses* seeming to make

no account of life, nor to apprehend the least fear of death.

The *Cochin-Chineses* are naturally the most courteous and affable of all the *Eastern* nations; and tho' on the one side they value themselves much upon their valour, yet on the other they look upon it as a great shame, to suffer themselves to be transported with passion. And whereas all the other *Eastern* nations, looking upon the *Europeans* as a profane people, do naturally abhor them, and therefore fly from us when first we come among them: in *Cochin-China* it falls out just contrary; for they

Their civility.

they strive who shall be nearest us, ask a thousand questions, invite us to eat with them, and in short use all manner of courtesy with much familiarity and respect. So it happened to me and my companions when we first came there, being, as it were, among friends of an old standing. This is a very good disposition to facilitate the preaching of the gospel.

**Liberality** This loving and easy disposition is the cause of much concord among them, they all treating one another as familiarly as if they were brothers or of the same family, tho' they have never known or seen one another before; and it would be look'd upon as a most vile action, if one man eating any thing, tho' never so little, shou'd not share with all about him, giving every one a bit. They are also naturally kind and free-hearted to the poor, to whom it is customary among them never to deny an alms, when asked; and it would be reputed a great fault to deny it, as if it were due to them. Thus it happened, that some strangers escaping from a shipwreck in a port in *Cochin-China*, and not knowing the language to make known their want, but learning only this word *doi*, which signifies, *I am hungry*: when the natives saw strangers at their doors, crying out *doi*, as if the greatest misfortune in the world had befallen them, every one strove to be before another in giving them to eat; so that in a short time they gathered so much provision, that a ship being afterwards given them by the king to return to their country, they took such an affection to that country, where they found all things for their sustenance at such easy rate, that not a man of them would go away; so that the captain of the ship was forced to drive them aboard with many blows and cuts, which he effectually did, loading the ship with the rice they had gathered only by going about, crying, *I am hungry*.

But as ready as the *Cochin-Chinese* are to give, so are they as apt, if not more, to ask any thing they see, so that as soon as ever they cast their eye on any thing that is new to them, and curious, they say, *Schin Mocai*; that is, *Give me one of these things*: and it is such a rudeness to refuse them, tho' the thing be rare and precious, that whosoever should do it, would be ever after looked upon as a vile person; so that a man must either hide, or be ready to give what he shews. A *Portuguese* merchant disliking this uncommon custom, as not used to it, resolved, since every one asked of him whatsoever he saw, to do the same with them: accordingly he came to a poor fisherman's boat, and laying hold of a pannier full of fish, in the country language; said to him, *Schin Mocai*, the ho-

nest man made no answer, but gave him **BORRY** all the pannier as it was, for him to carry home, as he did, admiring the liberality of the *Cochin-Chinese*; but taking compassion on the poor fisherman, he afterwards paid him the full value of it.

The manner of breeding and civility the *Cochin-Chinese* use, is more or less the same with that of the *Chinese*, always punctually observing all niceties; we know these latter observe between superiors and inferiors, equals, and the respect due to ancient persons, ever preferring the eldest, of what degree soever, and giving them preference before the younger. Wherefore some of those gentlemen coming often a visiting to our house, tho' the interpreter told them, that a father we had there somewhat elder than the rest, was not our superior: yet they could never be brought to pay their respect to the young superior, before the old man. In every house, tho' never so poor, the *Cochin-Chinese* have three sorts of seats; the first and meanest, is a mat upon the bare floor, on which persons of equal quality sit, as those that are of the same family. The next is, a low stool, covered with a very fine mat; which is for persons of better account. The third, is a couch about three quarters of a yard high, on which only the lords and governors of places sit, or persons dedicated to the divine service, and on this they always make our fathers sit.

This good nature and civility of the *Cochin-Chinese*, makes them so courteous to strangers, whom they allow to live according to their own laws, and to wear what cloaths they please; and so they praise their customs, and admire their doctrine, frankly preferring them before their own; quite contrary to the *Chinese*, who despise all but their own customs and doctrine.

As for their habit, we have before observed, that it is the general custom in *Cochin-China* to wear silk; it only remains to speak of the fashion of their clothes. To begin with the women; I think the modestest garb of all *India*; for even in the hottest weather, they suffer no part of the body to be uncovered: they wear five or six petticoats one over another, all of several colours; the first reaches to the ground, which they trail along the ground with such gravity and state, that the tips of their toes are not seen: the second is half a span shorter than the first: the third shorter than that; and so one over another; so that all the several colours appear: and this is the women's habit from the waist downwards, for on their bodies they wear doublets checkered, of several colours; over all they have a veil; but so thin, that tho' it covers them, yet it is transparent, and shews all their gaiety with

Their breeding.

Fashion of clothes.

**BORRI.** with modesty, and makes a beauteous majestic appearance. Their hair is loose, spreading over their shoulders, so long that it reaches to the ground, and the longer the greater beauty it is reckon'd. On their head they wear such a broad cap, that it covers all their faces, so that they cannot see above four or five paces before them; and these caps are interwoven with silk and gold, according to the quality of the person. The women when met, are not obliged to any other return of civility, but to lift up the brims of their caps, so much, as their face may be seen. The men, instead of breeches, swath themselves with a whole piece of stuff, putting on over them five or six long and large gowns all of fine silk, and of several colours, with wide sleeves, like those of the monks of the order of St. *Benedict*; and these gowns, from the waste downwards, are all flashed curiously, so that as a man moves, he makes a shew of all those several colours together, and if any wind blows to lift them up, they look like peacocks with their fine feathers spread abroad.

Hair and  
nails  
never cut.

They let their hair grow as the women do, down to their heels, and wear the same sort of hats, or broad caps. Those who have any beard, and they are but few, never cut it; being in this like the *Chinese*, as they are in suffering the nails of their hands to grow, which the people of note never pare; this being a mark of distinction between them and the commonalty, who always keep them short, for the convenience of their trades; whereas the gentry have them so long, that they cannot grasp any small thing in their hands. Nor can they approve of our fashion of cutting our hair and nails; being of opinion, that they were given by nature, as an ornament to man: so that some discourse arising once concerning hair, they started an objection, which was not so easy to answer at sight, saying: *If the Saviour of the world, whom in your actions you profess your selves to imitate, wore his hair long, after the manner of the Nazarites, as you your selves do affirm, and shew by your pictures, why do not you do so too?* Adding, *That our Saviour's wearing long hair, demonstrated it to be the better fashion.* But at last they were satisfy'd with the answer we made, that this imitation did not consist in the outward dress.

The scholars.

The scholars and doctors are somewhat more gravely clad, without so many colours and flashes, and therefore cover all their gowns with one of black damask. They also wear a thing like a stole about their necks, and a blew silk maniple on their arms, covering their heads with caps made after the manner of mitres.

Both men and women carry fans in their

hands, rather for ornament than use, and they are not unlike to those the women in *Europe* use. For mourning, as we *Europeans* use black, they wear white. They never uncover their heads in saluting, that being looked upon as an uncivil action. Wherein they agree with the *Chinese*, among whom that custom is reputed so unmannerly, that to comply with them in this particular, the fathers of the society were forced to obtain leave of pope *Paul* the fifth, to celebrate the holy sacrifice of the mass covered. In short, the *Cochin-Chinese* wear neither shoes nor stockings, only saving their feet with leather soles fastened across the toes with silk, like sandals; nor do they think it indecent to go quite barefoot; and though going shod or unshod, they are apt to dirty their feet, they value it not, there being in every house at the door of the chief room, a large pan of clean water, in which they wash their feet, leaving those soles or sandals they use there, to take them again when they go away, because they cannot then dirt their feet, all the floors being covered with mats.

The *Cochin-Chinese* not being so fond of their own customs, as to despise those of strangers, as the *Chinese* do, our fathers in those parts have no occasion to change their habit, wherein they differ but little from the generality of all *India*. They wear a thin cotton cassock, which they call *Ebingon*, and is generally blew, without any cloak, or other upper-garment. They have no shoes, neither after the *European*, nor country fashion; the first they cannot get, because there is no body knows how to make them; and the latter they cannot endure, because of the pain it is to any body that is not used to it, to have his toes spread at a distance from one another, by reason of the buttons that fasten them on, and therefore they choose as the less evil, to go quite barefoot, tho' it exposes them to continual pains in the bowels, especially at first, by reason of the dampness of the country, and their not being used to it. True it is, that in time nature complies, and the skin grows so hard, that it is no pain to walk upon stones or briars. When I returned to *Macao*, I could not endure shoes, thinking them a weight and encumbrance to my feet.

The chief sustenance of the *Cochin-Chinese* is rice; and it is wonderful, that tho' the country abounds in flesh, fowl, fish, and fruit, of so many several sorts, yet when they eat, they first fill their belly with rice, and then taste of other things, as it were for fashion-sake. They make more account of rice than we do of bread, and that it may not clog them, they eat it alone without any seasoning of salt, sugar,

use, and women in we *Euro-*. They ing, that vil action. *Chinese*, a- ted so un- em in this city were *Paul* the ice of the *bin-Chi-* ngs, only s fastened dals; nor quite bare- or unshod, they value use at the ge pan of their feet, y use there, go away, air feet, all ats. so fond of se those of r fathers in hange their little from ey wear a call *Ebin-* ithout any nt. They *European*, ey cannot nowns how they cannot t is to any o have his ne another, fasten them as the less ' it exposes the bowels, f the damp- not being time nature ys so hard, on stones or *acao*, I could em a weight

*Cochin-Chi-* Their diet. ul, that tho' e, fowl, fish, al sorts, yet l their belly ther things, They make do of bread, em, they eat g of salt, su- gar,

gar, oil, or butter, but boiled in so much water as will keep it from burning to, so that the grain remains whole, only soften'd and moisten'd. For this very reason that the rice is not seasoned, it is the easier of digestion, and therefore they that live upon rice, as they do in the *East*, commonly eat it at least four times a day, and a great quantity of it to support nature. The *Cochin-Chinese* eat sitting cross-legged on the ground, with a round table before them breast-high, with mouldings, or adorned with silver or gold, according to the people's quality or wealth. It is not very large; because the custom is for every man to have one to himself, so that at a feast, as many guests as there are, so many tables are provided, and the same is done when they dine privately; only, sometimes man and wife, or father and son, will make a shift with the same table. They neither use knives nor forks; of the first they have no need, because every thing is brought up from the kitchen cut into small bits; the place of the last is supplied by two little sticks, wherewith they neatly and very readily take up any thing; nor have they any need of napkins, for they never foul their hands, nor touch any thing with them.

Their  
treats.

There are frequent invitations among neighbours, and at these entertainments they provide other sorts of dishes than what we have hitherto spoke of; for they make no account of rice, supposing every man has enough of that at home; and tho' he that treats be never so poor, he does not come off with credit, unless every guest's table be served with at least an hundred dishes; and it being the custom to invite all their friends, kindred and neighbours, there is no feast where there is less than thirty, forty, fifty, sometimes a hundred, and even two hundred guests: I was once my self at a solemn entertainment, at which no less than two thousand were feasted, and therefore these banquets must be made in the country, that there may be room for so many tables. Nor must any body admire that the tables being small, they be furnished with a hundred dishes at least; for upon these occasions they very curiously make frames of sugar-canes on the table, on which they dispose of the said dishes; and there must be in them all the varieties of meat the country produces, as well flesh as fish, and butcher's meat as fowl, wild and tame creatures, with all sorts of fruit the season affords; for if but one were wanting, it would be a great fault in the entertainer, and they would not count it a feast. The men of quality that are invited eat first, being waited on by their chief servants. When the masters have tasted of all they like best, these same

principal servants take their places, and *BORRI*. eat, being waited on by the inferior sort: then these succeed in their places; and because all of them are not able to consume such plenty, and according to custom all the dishes must be emptied; when these are satisfied, then the very meanest servants of every great man come in, and do not only eat their belly full, but put up all the fragments in bags they carry for that purpose, and carry them home, where they merrily divide it among the boys, and other mean fry, and so the feast ends.

Their  
drink.

*Cochin-China* produces no grapes, and therefore instead of wine they drink a liquor distilled from rice, which tastes like brandy, and resembles it in colour and harshness, spirit and briskness, and they have such plenty of it, that all people in general drink as much as they will of it, and are as drunk as people are among us with wine. Graver persons mix that liquor with some other water distilled from *calamba*; which gives it a delicious smell, and is a delicate composition.

Between meals they drink hot water, wherein they boil the root of an herb they call *chia*, from which the liquor takes name. It is cordial, and helps to digest humours from the stomach, and advance digestion. The *Japanese* and *Chinese* use such a sort of drink, only that in *China*, instead of the root, they boil the leaves of the herb; and in *Japan*, a powder made of the same leaves; but the effect is the same, and they all call it *chia*.

Amidst this great plenty of meat, and abundance of provisions, it is incredible how much hunger and thirst we *Europeans* endure; not so much for want of food, as because we are not used to that diet, nature finding a very great misfortune of bread and wine: and I believe the *Cochin-Chinese* would be in the same condition, should they come into *Europe*, where they would be deprived of their usual sustenance of rice, tho' they had plenty of other delicate provisions. To this purpose I will not omit to relate what happened to us with a governor of *Cochin-China*, he being a friend of ours, was invited by us to eat at our house; and the more to shew our affection, we endeavoured to have several dishes dressed for him after the *European* manner. He sat down to table, and when we expected he should acknowledge our kindness, commend the cookery, and thank us for the rarity, because we had been at much trouble about it: when he had tasted them all, he could not eat of any one, though out of civility he strove against his stomach; and we were forced to dress more meat after the country-fashion, the best we could, whereof he afterwards eat very favourably,

**BORRI.** to his own and our satisfaction. Yet providence does not neglect a thousand ways to support those that undergo these hardships for the preaching of the gospel, finding means, even in this world, to requite what they suffer for the sake of God, as happens in this particular of food, as was before said of going bare-foot; for by degrees nature grows familiar with it, and comes to be so habituated to the custom of the country, that it looks strange when to return to its first ways. This happened to me, who when I returned from thence, coveted nothing but the rice of *Cochin-China*, which I thought satisfied me more than any other thing.

**Physicians.** As for physicians, and their way of practice, there are abundance of doctors, not only *Portuguese*, but natives; and it often is experimentally known, that the country physicians easily cure several diseases, which the *European* physicians know not what to do with: so it sometimes happens, that after our physicians have given over a patient, they call one of the country, and he cures him.

**Way of practice.** The physicians of the country use this sort of practice: being come to the patient's bed-side, they stay a little to settle themselves after the motion of coming; then they feel the pulse for a long while together, very attentively, and with much consideration; after which they usually say, You have such a distemper; and if incurable, they honestly say, I have no cure for this disease: which is a sign the patient will die. If they find the disease curable, they say, I have a medicine that will cure him; and I will do it in so many days. Then they agree what they are to have if they cure the sick man, bargaining the best they can, and sometimes they draw up writings to bind the contract. After this the physician himself prepares the medicine, without the help of an apothecary; for which reason there are none in the country: and this they do, that they may not discover the secret of the art they work; and because they will not trust another to put together the ingredient they prescribe. If the patient recovers within the time appointed, as generally happens, he pays the price agreed on; if he miscarries, the physician loses his labour and medicines.

**Medicines.** The medicines they give are not like ours, which cause a loathing, and are laxative; but theirs are palatable as their broths, and nourishing without any other sustenance, which makes them give the patient several doses in a day, as we give broth at so many hours interval; and these do not alter the course of nature, but only help the usual operations of nature dispersing the peccant humours, without wracking the patient.

I remember a passage worth the relating in this place: a *Portuguese* falling sick, sent for the *European* physicians; who having used their endeavours, gave him over. When they were gone, a physician of the country was called; who undertook to cure him in so many days, strictly enjoining him, whilst he was under his hands, to have a care of having to do with women upon pain of certain death, from which the virtue of his medicine could not deliver him. They agreed upon the price, and the physician undertook to cure him in thirty days. The patient took the medicines prescribed him, and in a few days found himself so well recovered, that he was not afraid to transgress the physician's injunction; who coming to visit him, by the alteration of his pulse discovered the sick man's incontinency, and bid him prepare to die, because there was no cure for him; but that he should pay him his money, since it was none of his fault that he must die. The case was try'd; the sick man was adjudged to pay: and so he died.

Bleeding is also used, but not so much as in *Europe*, nor is it done with a steel lancet; but they have abundance of goose-quills, in which they fix some bits of fine porcelain, made sharp, and shaped like the teeth of a saw, some bigger, some less, of several sizes. When they are to let blood, they apply one of these quills to the vein, proportionable to the bigness of it, and giving it a fillip with the finger, open the vein, only so much of the porcelain entering as is requisite: and what is most wonderful, when they have drawn the blood, they use no fillet or binding to stop it; but wetting their thumb with spittle they press the orifice, so that the flesh returning to the place whence it was parted, the blood is stoppt, and runs out no more: which I suppose to proceed from the manner of opening the vein, as it were sawing it with that porcelain full of teeth, and therefore it closes again the easier.

There are also surgeons, who have some wonderful secrets, whereof I will give but two instances, one practised upon my self, the other upon one of our brothers, my companion: I happened to fall from a very high place, with my breast against the corner of a stone, whereupon I presently began to spit blood, and had a wound in my breast outwardly. We applied some medicines after our *European* manner, but to no purpose. A surgeon of the country came and took a quantity of a certain herb like that we call mercury, and making it into a plaister, laid it on my breast, then he caused some of that herb to be boiled for me to drink, and made me eat

A notable story.

Cures.

the same herb raw: and thus in a few days perfectly cured me. I, to make another experiment, caused the leg of a hen to be broke in several places, and making a plaister as he had done of the same herb, bound it upon the broken leg, and in a few days it was whole and sound.

A scorpion bit a brother of ours, my companion, in the neck; and in that kingdom the bite of a scorpion is mortal. All his throat swelled immediately, and we were about giving him extreme unction. A surgeon was sent for, who immediately set a pot of rice a boiling in nothing but fair water, then clapping the pot to the brother's feet, covered him and it close with cloths, that the steam might not go out, and as soon as the said steam and hot

smoke of the rice came up to the place <sup>BORR.</sup> where the bite was, the brother felt the pain abate, the swelling in his throat fell, and he remained as sound as if nothing had ailed him.

Many other instances might be added, but I shall only say, that the medicines in those parts have a greater virtue than when they come to us; and particularly I can affirm, that I brought with me a small cask of *rhubarb*, which was extraordinary good there, and when I came into *Europe*, having spent two years by the way, I found it so changed, that I scarce knew it my self, so that those medicines lose much of their virtue in bringing from those countries to our parts.

## CHAP. VI.

### Of the Civil and Political Government of the Cochin-Chineſes.

I Will give a brief account of as much as may suffice for the reader's information; for it would be too tedious, and from the purpose of this my short relation, to discourse of every thing in particular. The government of *Cochin-China*, in general, is a medium betwixt those of *Cbina* and *Japan*: for whereas the *Japoneſes* make less account of learning than military knowledge: and on the contrary, the *Chineſes* attribute all to learning, taking little notice of warlike affairs. The *Cochin-Chineſes* following the example of neither, equally encourage learning, and skill in war, according as occasion offers, sometimes preferring the foldier, and sometimes the scholar, and so repulsing them as appears most convenient.

Learning. In *Cochin-China* there are several universities, in which there are professors, scholars, and degrees conferred by way of examination, in the same manner as is practised in *Cbina*, the same sciences being taught, and the same books and authors read; that is, *Zinſu*, or *Confucius*, as the *Portugueſes* call them; which are authors of such profound learning, and in such esteem and reputation among them, as *Aristotle* is among us, being much ancients than he. These books of theirs are full of erudition, of stories, of grave sentences, of proverbs, and such like things, for the directing a civil life, as are *Seneca*, *Cato*, and *Cicero*, among us; and they spend many years in learning the true sense of the phrases, words, characters, and hieroglyphicks, they are writ in; but that they most value is moral philosophy, or ethics, æconomy, and policy. It is comical to see and hear them, when they are studying, read and repeat their lessons in such a

tone as if they were singing, which they do to use themselves to it, and give every word its proper accents, which are many, every one expressing a several thing: and therefore one would think, that to converse with them, a man must understand the grounds of music.

The language they generally speak, is different from that they read and teach in at the schools, and which their books are writ in: as among us the vulgar language differs from the *Latin* used in the schools. Wherein they differ from the *Chineſes*, who, if they are learned, or noble, always use the same language, which they call of *mandarines*; that is, of doctors, judges, and governors, and the characters they use in writing: and printing their books, are above eight thousand, all differing from one another. And for this reason the fathers of the society spend eight, and even ten years, in studying the *Chineſe* books, before they can be masters, and go abroad to converse with them. But the *Cochin-Chineſes* have reduced the characters to three thousand, which they generally make use of: and these are enough to express themselves in their harangues, letters, petitions, memorials, and such things which do not belong to printed books; for those of necessity must be in *Chineſe* characters. The *Japoneſes* have been more ingenious, who tho' in all that belongs to books, whether written or printed, they agree with the *Chineſes*; yet for common uses have found out forty eight letters, wherewith they express whatsoever they please, as well as we do with our alphabet: and yet the *Chineſe* characters are in such esteem even among the *Japoneſes*, that these forty eight letters, notwithstanding the use they are of above the others,

**BORRI.** others, are contemned in comparison of them; inasmuch, that in scorn they call them women's letters.

The ingenious invention of printing was found out in *China*, and *Cochin-China*, long before it was in *Europe*: but not in such perfection: for they do not compose joining letters and characters, but with a graver, penknife, or such instrument, cut and carve the characters upon a stone as they will have them in their books: on this board so carved they lay their paper, and print it off, as we in *Europe* do copper-plates, or the like.

Besides these books of morals, they have others, which contain things they account sacred; as for instance: the creation and beginning of the world: of the rational souls of demons: of idols, and of their several sects. These books are called *Saye Kim*, to distinguish them from the profane, which they call *Saye Chiu*. Of the doctrine of their sacred books, we shall treat in the second part of this account, where the subject will be more suitable.

The language.

Tho' the language of the *Cochin-Chineſes* be in one respect like that of the *Chineseſes*, both of them using all monosyllables, delivered in several tones and accents; yet they utterly differ in the word it self, the *Cochin-Chineſes* being more full of vowels, and consequently softer and sweeter, more copious in tones and accents, and therefore more harmonious. The language of *Cochin-China* is, in my opinion, the easiest of any, for those that have a musical ear, to take the tones and accents; for it has no variety by way of conjunction of verbs, or declination of nouns, but one and the same word, with the addition of an adverb, or pronoun, signifies the present, the preterit, and future tenses, the singular number, and the plural; and in fine, serves for all moods, tenses, and persons, and the diversity of numbers and cases. For instance: This word, *To have*, which in the *Chineseſe* language is *Co*, by only adding a pronoun, serves all occasions, saying, *I have*, *Thou have*, *He have*; the name of the person making that diversity, which we express by altering the termination, thus, *I have*, *Thou hast*, *He has*. In the same manner they make the several tenses; saying, for the present, *I now have*; for the preterit, *I heretofore have*; and for the future, *I hereafter have*: And so without ever altering the word *Co*; by which it appears how easily this language may be learned: as it happened to me, who in six months understood so much, that I could discourse, and even hear their confessions, tho' not so perfectly, for it requires at least four years to be a master. [This variety of moods and tenses, appears better by the Latin, or

other languages, than in English, where we use much the same method, as he represents in *Cochin-China*; our variations the same, being but few, as to instance in the same word, I have, You have, We have, They have, I shall have, May we have: and so in this, and many others.]

But to return to our relation: I was saying, that the *Cochin-Chineſes* reward not only the learned with dignities, employments, and revenues; but that they make great account of good soldiers, in which particular they act differently from us; for instead of assigning brave commanders, some land, earldom, or marquissate, as a reward of their valour, they allot him such a number of people, and vassals, belonging to the king himself, who whatsoever part of the kingdom they live in, are obliged to own him as their lord, to whom they have been assigned by the king, being bound upon all occasions to serve him with their weapons, and to pay him all those duties they before paid to the king himself; and therefore, as we say, such a one is lord, earl, or marquess of such a place; they say, such a one is a man of fifty, such a one of a thousand men, to such a one the king has added three thousand, to such a one two thousand; their dignity, wealth, and grandeur increasing by the addition of many vassals. We shall speak of the wars of this kingdom in the next chapter.

It remains that we say somewhat worth being known of the civil government. In the first they govern rather after a military manner, than by judges, counsellors, and lawyers, and their formalities, the vice-roys and governors of provinces performing that function; for every day they give publick audience for four hours daily, in a large court within their own palace, two hours in the morning, and two after dinner. Hither all suits and complaints are brought, and the vice-roy, or governor, sitting on a tribunal raised like a balcony, hears every man in his turn; and these governors being generally men of sound judgment, capacity, and experience, they easily discover the truth of the matter by the questions they put, and much more by the common consent of the stander-by, which is gathered by the applause they give the plaintiff, or defendant, and accordingly they immediately, without delay, give judgment with a loud voice, which is immediately executed without any demur, or appeal, whether the sentence be death, banishment, whipping, or fine, every crime being punished as the law appoints.

The crimes generally try'd and severely punished are many, but they are particularly rigid against false witnesses, thieves, and adulterers. The first of these being convicted

Rewards for military men.

False witnesses, how punished.

convicted of having given false evidence, are themselves indispensably condemned, as if they themselves had committed the crime they accuse others of. And if the crime they alledged deserved death, they are sentenced to die: and experience teaches, that this way of trial is very proper to find out the truth.

**Thieves.** Thieves, if the theft be considerable, are beheaded; if small, as for example, a hen, for the first offence they have a finger cut off, for the second another finger, for the third an ear, and for the fourth the head.

**Adulterers.** Adulterers, both men and women, indifferently are cast to the elephants to be killed, which is done thus: They lead the criminal out into the field, where in the presence of an infinite number of people flocking together, he is set in the middle with his hands and feet bound, near an elephant, to whom the condemned person's sentence is read, that he may execute every part of it orderly; first that he lay hold of, grasp, and hold him fast with his trunk, and so hold him in the air, shewing him to all the company; then that he toss him up, and catch him upon the points of his teeth, that his own weight may strike them through him; that then he dash him against the ground; and lastly, that he bruise and crush him to pieces with his feet: All which is exactly performed by the elephant, to the great terror and amazement of the spectators, who are taught by this punishment, at another man's cost, what fidelity is due between married persons.

Since we are upon this point of matrimony, it will not be from the purpose to deliver some farther particulars concerning it, before we conclude this chapter. The *Cochin-Chinese*, tho' heathens, never use to contract matrimony within those degrees forbid by the laws of God and nature, nor within the first degree of the collateral line of brothers and sisters. In other degrees matrimony is lawful to every man with only one woman; tho' rich men use to have many concubines, under pretence of grandeur and generosity, looking upon it as covetousness, not to have as many as every man's income will conveniently maintain; and these are called second, third, fourth, and fifth wives, and so on, according to every one's rank, all which wait upon the first, which is accounted, and really is the true wife, whose business it is to chuse the others for her husband. But these marriages of theirs are not indissoluble, the laws of *Cochin-China* allowing of divorces, but not at the will of either party, it being first requisite, that the person suing for it, convict the other of many offences; which being made out, it is lawful to dissolve the first marriage, and marry again. The husbands bring the portion, and leave their own houses to go to the wife's; upon whose fortunes they live, the women managing all the household-affairs, and governing the family whilst the husband lives idle at home, hardly knowing what there is in the house, satisfied that they have meat and clothes.

# CHAP. VII.

## Of the Power of the King of Cochin-China, and of the Wars he has in his Kingdom.

**Their skill in cannon and small arms.** I Took notice at the beginning of this account, that *Cochin-China* was a province of the great kingdom of *Tonchin*, usurp'd by the grandfather of the king now reigning; who being made governor of it, rebelled against the kaid king of *Tonchin*; to which he was not a little encouraged, by having in a short time got together a great many pieces of cannon of the wrecks of several *Portuguese* and *Dutch* ships, cast away upon those rocks, which being taken up by the country people, there are above sixty of the biggest, at this time, to be seen in the king's palace. The *Cochin-Chinese* are now become so expert in managing artillery, that they perform it better than the *Europeans*, practising continually to shoot at a mark, with such success, that being proud of their skill, as soon as any *European* ship arrives in

their ports, the king's gunners challenge ours, who being sensible that they cannot stand in competition with them, as near as they can, avoid this trial of skill, being convinced by experience, that they will hit any thing as exactly with a cannon, as another shall do with a firelock; which they are also very expert at, often drawing out into the field to exercise. Another great encouragement to rebellion, was, his having above a hundred galleys, which rendering him formidable by sea, and the artillery by land, he easily compass'd his designs against the king of *Tonchin*. Besides, by reason of the constant trade in *Japan*, there were in *Cochin-China* abundance of *Catars*, which are scymitars made in *Japan*, and excellently temper'd: And all the country abounding in horses, which tho' small, are handsome and mettlesome,

**BORAT.** themselves, on which they fight, casting darts, and daily exercise themselves.

**King's power.**

The power of this king is so great, that whenever he pleases, he can bring 80000 fighting men into the field, and yet is always in fear of the king of *Tonchin*, whose power is four times as great; to whom, for quietness sake, he, by agreement, pays a tribute, of all such things as his kingdom affords, and are useful for that of *Tonchin*, particularly of gold, silver, and rice; furnishing, besides all this, plank and timber for building of galleys. And for the same reason he was about entering into a league with the fugitive son of the late king, who lorded it in the utmost province of *Tonchin*, which borders upon *China*, that in case he succeeded, and became master of *Tonchin*, *Cochin-China* might remain free from all tribute and acknowledgment.

For the better understanding hereof, it is to be observed, that when I was in *Cochin-China*, that kingdom was in the possession not of the precedent king, but the tutor or governor of that son, who made his escape from the said governor to save his life. The said prince lived like a fugitive, in the farthest province adjoining to *China*; where being known to be what he was, that is the late king's son, he was received by that people as their sovereign lord, and by his good government he had so strengthened himself, that his tutor already declared king of *Tonchin*, was much afraid, seeing him grow so great, lest he should agree with the king of *Cochin-China*, who is of the opposite side, to catch him between them, and expel him his unjust possession. He therefore every year form'd a considerable army to destroy the aforesaid prince; but always to no purpose, because the army being of necessity to march five or six days, through a country where there is no other water to drink, but that of some rivers coming from the enemies country; the army always found it poison'd by the prince's party, with a sort of herb, the effect whereof was such, that it destroyed both men and horses; which obliged him always to retire after much trouble and expence cast away.

**Wars in Cochin-China.**

The military discipline, and art of war in *Cochin-China*, is almost the same as in *Europe*, the same form being observed in drawing up, fighting, and retiring. This king has generally war in three parts of his kingdom: First, he is always upon his defence against the king of *Tonchin*, who as has been said continually threatens and assaults his frontiers, and therefore the king of *Cochin-China* has his residence in *Sinua*, the extreme part of his dominions, the better to oppose him, and march his

forces towards the confines of *Tonchin*, which is a powerful province, and generally under experienced and martial governments.

The next is a sort of civil war, raised by two of his own brothers, who aiming to be equal in command and power, not satisfied with what has been allotted them, have rebelled against him, and craving succours from *Tonchin*, gave him perpetual trouble. Whilst I lived in those parts, they having got some pieces of cannon, which they carried upon elephants, fortified themselves so well upon the frontiers, that the king's army marching against them, was in the first engagement routed with the loss of 3000 men; but coming to a second battle, the king's brothers lost all they had gained before, being both made prisoners; and they had both immediately lost their lives, had not his majesty's natural clemency and brotherly affection prevailed, and taken place of his anger, so far as to spare their lives, yet so as to keep them prisoners.

The third place where he has continual war, is on the west-side, and utmost bound of his kingdom called *Renran*, against the king of *Chiampá*; whose efforts being weaker, are sufficiently repulsed by the troops of that same province, and the governor.

He is also in continual motion, and making warlike preparations to assist the king of *Cambogia*, who has married his bastard daughter, sending him succours of galleys, and men, against the king of *Siam*; and therefore the arms of *Cochin-China*, and their valour, is famous and renowned, as well by sea as by land.

At sea they fight in galleys, as has been The said, each of which carries cannon, and is lie. mann'd with musketeers: Nor will it seem strange, that the king of *Cochin-China* has an hundred, or more, galleys in a readiness, when the method of furnishing them is known. It is therefore to be observed, that the *Cochin-Chinese* do not use to have a crew of criminals, or other slaves, to row in their galleys; but when they are to go out to fight, or for any other purpose, the way to man them immediately is this: A great number of officers, and commissaries, go out privately, and scouring on a sudden all together throughout the whole kingdom, with the king's authority, press all they find fit for the oar, conducting them all together to the galleys, unless they be exempted by birth, or any other privilege. Nor is this method so troublesome as it appears at first sight; for in the first place they are well used and paid aboard the galleys; and besides, their wives and children are fed and provided with all things necessary,

cessary, according to their condition, all the while they are from their houses. Nor do they only serve at the oar, but upon occasion lay hold of their weapons, and behave themselves bravely, for which purpose every one has his musket, darts, and scymitar allotted him; and the *Cochin-Chinese* being of an undaunted spirit, and brave, they give good tokens of their valour, either rowing to join their enemies, or with their arms when joined. Their galleys are somewhat less, but particularly narrower than ours, but so neat, and so well adorned with gold and silver, that they afford a glorious sight. Chiefly the stem, which they account the most honourable part, is all over gold, there the captain and persons of chief note have their station: and the reason they give for it is, that it being the captain's duty to be the first upon any danger, it is fit he should be in the pro-

perest part of the gally for that purpose. *Barri.*

Among other sorts of defensive arms they use in war, they have certain oval, hollow targets, so long that they cover a man quite, and so light, that they can manage them without any trouble. The cities of this kingdom have a great advantage in the manner of their houses, which being all of wood upon pillars of timber, as has been said before when the enemy comes so strong, that they perceive they cannot oppose him, every man flies to the mountain with what he has, firing the houses, so that the enemy finds nothing but the ruins left by the flames, and having no place to fortify himself, nor any thing to subsist on, is forced to retire back to his own country, and the inhabitants returning to the same place in a short time, with great ease rebuild their houses.

## CHAP. VIII.

### Of the Trade and Ports of Cochin-China.

Trade of  
*Cochin-  
China.*

THE great plenty *Cochin-China* affords of all things necessary for the support of human life, as has been said before, is the cause that the people have no curiosity, or inclination to go into other kingdoms to trade; and therefore they never go so far to sea, as to lose sight of their beloved shore; yet they are very ready to admit of strangers, and are very well pleased they should come not only from the neighbouring countries, but from the remotest parts to trade with them. Nor do they need to use any art for this purpose, strangers being sufficiently allured by the fruitfulness of the country, and the great wealth which abounds there; and therefore they resort thither not only from *Tonchin*, *Cambogia*, *Chinchoos*, and other neighbouring places, but from the remotest, as *China*, *Macao*, *Japan*, *Manila*, and *Malacca*, all of them carrying silver to *Cochin-China*, to carry away the commodities of the country, which are not bought, but exchanged for plate, which is here put off as a commodity, being sometimes worth more, and sometimes less, according as there is more or less plenty of it, as is usual with silk and other goods.

All the coin they use is of brass, and of the same value, like a *quadrine*, 500 of which make a crown. These pieces are quite round, with the king's arms and ensign stamped on them, and every one of them has a hole through the middle, which serves to string them by thousands, and every thousand is worth two crowns.

The *Chinese* and *Japanese*, drive the chief trade of *Cochin-China*; which is managed

at a fair held yearly at one of the ports of this kingdom, and lasting about four months. The *Chinese*, in their vessels they call *junks*, bring the value of four or five millions in plate; and the *Japanese*, in their ships called *sonnes*, an infinite quantity of very fine silk, and other commodities of their country. The king has a vast revenue from this fair by customs, and impost, and all the whole country receives great profit. The *Cochin-Chinese* applying themselves very little to arts, because plenty makes them lazy; and being soon taken with the curiosities of other countries it comes to pass, that they put a great value upon, and buy at great rates, many things, which to others are of very small worth; as for instance, combs, needles, bracelets, and pendants of glass, and such-like women's tackling. I remember a *Portuguese*, who bringing into *Cochin-China* from *Macao*, a box full of needles, which could not be worth above thirty ducats, made above a thousand of it, selling that for sixpence in *Cochin-China*, which had not cost him above a farthing at *Macao*. In short, they out-bid one another, in buying any thing that is very new and strange without sparing for price. They are very fond of our hats, of caps, of girdles, shirts, and all other sorts of garments we wear, because they are quite different from theirs; but above all, they put a great value upon coral.

As for their ports, it is wonderful that in a coast little more than an hundred leagues in length, there should be above sixty most convenient landing-places, which

Richtrade  
of the  
*Chinese*  
and *Ja-  
ponese*.

Sea-ports.

**BORR.** is so, because there are many large arms of the sea. But the principal port, to which all strangers resort, and where the afore-mentioned fair is kept, is that of the province of *Cacbian*, which has two mouths, or inlets from the sea, the one called *Pullucbiampello*, and the other of *Turon*, being at first three or four leagues distant from one another, but running in seven or eight leagues like two great rivers, at last join in one, where the vessels that come in both ways meet. Here the king of *Cochin-China* assigned the *Chinese*, and *Japanese*, a convenient spot of ground, to build a city for the benefit of the fair. This city is called *Faisó*, and is so large, that we may say they are two, one of *Chinese*, the other of *Japanese*; for they are divided from one another, each having their distinct governor, and the *Chinese* living according to the laws of *China*, as the *Japanese* do according to those of *Japan*.

All nations admitted to trade.

And because, as we said before, the king of *Cochin-China* gave free admittance to all nations whatsoever, the *Dutch* resorted thither with all sorts of commodities. Hereupon the *Portuguese* of *Macao* resolved to send an ambassador to the king, to demand in their name, that the *Dutch*, as mortal enemies to their nation, should be excluded all *Cochin-China*. One captain *Ferdinand de Costa*, a man well known for his valour, was appointed to go upon this embassy, which he delivered and was favourably heard, with assurances of obtaining his demands. Nevertheless, whilst he was yet at that court, there arrived a *Dutch* ship, and coming to an anchor in the port, some of them landed with much mirth and jollity, and presently went with rich presents to the king: He accepted of them very graciously, and granted them the usual liberty of trading freely in his kingdom. *Costa* hearing of it, went presently to the king, and complaining, That his majesty did not keep his word with him, in a *Portuguese* bravado gave a stamp on the ground to shew his resentment. The king and all the courtiers were pleased at his passion, and bidding him have patience, and expect the event, for he should find he had no cause to complain, dismissed him. In the mean while he ordered all the *Dutch* to go ashore, and land all their goods against the fair at *Turon*, as the *Portuguese* did; which they perform'd: But as they were going upon the river in boats, they were on a sudden assaulted by the galleys, which destroyed most of them. The king remained master of their goods; and to justify this action, alledged, that

he very well knew the *Dutch*, as notorious pirates, who infested all the seas, were worthy of severer punishment; and therefore, by proclamation, forbid any of them ever resorting to his country: and it was actually found, that those very men had robbed some vessels of *Cochin-China*, and therefore took this just revenge; admitting the *Portuguese* as good and sincere friends: Who not long after sent another ambassador from *Macao*, to obtain of the king a confirmation of the afore-said edict, at the instance of *Acosta*, alledging as a motive, the danger that the *Dutch*, in time, might cunningly possess themselves of some part of *Cochin-China*, as they had done in other parts of *India*. But the new ambassador was advised by knowing men of that country, not to mention any such thing to the king, because that very thing would be a motive to him to grant the *Dutch* a free trade, and invite all *Holland* to come over; he pretended to be afraid of no nation in the world; quite contrary to the king of *China*, who being afraid of every body, forbids all strangers trading in his kingdom; and therefore the ambassador must urge other motives to obtain his desire.

The king of *Cochin-China* has always shewn himself a great friend to the *Portuguese* that trade in that kingdom, and has several times offered them three or four leagues of the fruitfulest country about the port of *Turon*, that they may build a city there with all sorts of conveniences, as the *Chinese*, and *Japanese*, have done. And were it allowed me to give his catholick majesty my opinion in this point, I should say, he ought, by all means, to command the *Portuguese* to accept of the kind offer made them, and to build a good city there as soon as possible; which would be a refuge, and brave defence, for all the ships that pass by towards *China*: For here a fleet might be kept in readiness against the *Dutch*, that sail to *China* and *Japan*, who of necessity must pass through the middle of the bay, that lies between the coast of this kingdom, in the provinces of *Ranran*, and *Pulucambi*, and the rocks of *Pulusifi*.

This is what small matter I thought I could, with truth, give an account of, concerning the temporal state of *Cochin-China*, according to the knowledge I could gain in some years I resided there; as will farther appear in the second part of this relation.

first that  
taught  
Christi-  
anity in  
Cochin-  
China.

**B**EFORE the fathers of the society of J E S U S went into Cochín-China, it was the custom of the Portuguese trading thither, to carry thither with them from Malacca, and Macao, and the Spaniards from Manila, some chaplains, to say mass and administer the sacraments to them, during their stay there, which generally was three or four months in a year. These chaplains having no other obligation but only to serve the Portuguese, never thought of promoting the spiritual welfare of the natives of that country, not applying themselves to learn their language, nor using any other means to communicate the light of the gospel to them. And yet there was one of these who had the face to publish in Spain, in a book call'd, *The Voyage of the World*; that he had catechis'd and baptis'd the infants or princess of Cochín-China, and a great many of her ladies: whereas never infant, nor any other person of all that royal family, till this time, has shewn any inclination to become Christian, notwithstanding we fathers go every year to visit the king, and discourse with all the great men of the court; and yet the infant has not given any token of being a Christian, or so much as knowing what a Christian is. And it may well be discern'd, how falsely he talks in this point, by the other fables he adds in the same book, concerning that infant; as that she would have marry'd the said chaplain, and the like. We know of none but some fathers of the order of St. Francis, that went from Manila, and one of St. Augustine, from Macao to Cochín-China, merely for the conversion of those souls. But they meeting with no success, by reason of the many several difficulties that occur, they return'd to their countries: Providence so ordering it, which had design'd that land to be culti-

Vol. II.

vated by the sons of the holy patriarch Ignatius, which was done as follows.

Certain Portuguese merchants acquainted the superiors of the society of J E S U S at Macao, with the great advantages that might be gain'd, to advance the glory of God in Cochín-China, if there were undaunted and zealous labourers sent thither; and particularly one captain earnestly pressed the father provincial, not to abandon a kingdom so capable of being instructed in the holy faith. The proposal seem'd to the father very agreeable to the spirit of our vocation, and therefore without demurring upon the execution of it, he made choice for this enterprize of F. Francis Buzome, who had been professor of divinity at Macao, by birth a Genoese, but educated in the kingdom of Naples, where he was admitted into the society, and whence he set out for India: together with F. James Caravalbo, a Portuguese, who from Cochín-China was to attempt to go over to Japan, as he did. This was he, who being put into a pool of cold water in the dead of winter, and expos'd to the wind and snow, gave up his life for the sake of his Redeemer, freezing leisurely to death. F. Caravalbo being gone, F. Buzome was left alone in Cochín-China, with only a lay-brother to attend him: being zealously inflam'd with the desire of saving souls, he us'd all possible means for their conversion, and to this purpose began his mission at Turon. But as yet he knew not the language, nor could he find any interpreter that knew any more Portuguese than what was requisite for buying and selling, and some words or phrases, which the interpreters of the chaplains of ships, who were there before the fathers of the society, made use of to ask the Cochín-Chinese, Whether they would be Christians? After this manner they

BORRI.

ing thi-  
ther.

Mistaken  
conver-  
sion.

BORRI. they had made some, but such as might rather be accounted so by name than by profession; for they did not so much as understand what the name of a Christian meant: and this by reason of the phrase the interpreters us'd to ask them, Whether they would be Christians: for the words they made use of, signify'd nothing more, than that they would become *Portuguese*; which F. Francis Buzome found out by this following accident: a play was acted in the publick market-place, at which the father saw one in the habit of a *Portuguese*, brought in by way of ridicule, with a great belly so artificially made, that a boy was hid in it; the player, before the audience, turn'd him out of his belly, and ask'd him, Whether he would go into the belly of the *Portuguese*? Using these words, *Con gnou muon bau tlom laom Hoalaom cbiam*? That is, *Little boy, will you go into the belly of the Portuguese, or not?* The boy answer'd, *He would*: and then he put him in again, often repeating the same thing to divert the spectators. The father observing, that the phrase the player so often repeated, *Muon bau tlom laom Hoalaom cbiam*, was the same the interpreters us'd, when they ask'd any one, Whether he would be a Christian? Presently conceiv'd the mistake the *Cochin-Chinese* were under; who thought, that to become a Christian was only to cease being a *Cochin-Chinese*, and become a *Portuguese*; which to make sport was express'd in the play, by making the boy go into the belly of him that acted the *Portuguese*. The father took care, that so pernicious an error should spread no farther, teaching those already baptis'd their duty, and instructing those that were newly converted, what it was to be baptis'd and become a Christian, taking particular care that the interpreters should be well inform'd in this particular, that they might afterwards serve faithfully in teaching of others; changing the abovemention'd phrase into this, *Muon bau dau christian cbiam*? That is, *Will you enter into the christian law, or no?* His great diligence and charity was so successful, that within a few days he began to reap the fruit of his labours, as well by the reformation of those who before were Christians only in name, as the conversion of many more. Nor was the same of his charity and zeal for the gaining of souls confin'd to *Turon*, his usual place of residence, but spread abroad into other places; he labouring in all places to

instruct, convert, and dispose the people to receive baptism with such fervour, and so great a concourse about him, that in a short time those new Christians built a very large church at *Turon*, in which the most holy sacrifice of the mass was publickly celebrated, and the christian doctrine preach'd and taught, by means of the interpreters, then well instructed; all persons being very much taken with F. Francis Buzome: who besides his being a person of great knowledge and virtue, entirely gain'd the affections of those heathens, by his great meekness and affability, inso-much that they all flock'd after him. This particularly happened at *Cacchiam*, the city where the king resides, six or seven leagues from *Turon*, up the river.

Here F. Buzome made so great an impression, that a place was presently allotted him for a church, which was built in a very short time, every body contributing to the expence, and to the work, according to their power. Besides, he had a good house assign'd him, fit for to make a residence of fathers, who were to go thither in time to instruct that people in matters of faith: all which was done with the assistance of a most noble lady, who was converted, and in baptism took the name of *Joanna*. She not only undertook the foundation of the house and church, but erected several altars and places of prayer in her own house, never ceasing to bless and praise God for the mercy shewn her, in enlightening and drawing her to the faith. All this his divine majesty brought to pass in the space of a year, through the means of his servant, F. Francis Buzome; whose fame being spread as far as *Macao*, the following year our father provincial thought fit to send him another father, that was younger, with a *Japense* brother, that learning the language, he might afterwards preach without standing in need of an interpreter. This was F. Francis de Pina, a *Portuguese*, who had learn'd divinity under F. Francis Buzome. And tho' this second year the increase was not answerable to that of the first, as to the conversion of souls, yet the advantage was much greater in the sufferings of a cruel persecution, rais'd by the enemy that sow'd the tares, who could not endure to see the divine seed grow up so prosperously in those parts, and endeavour'd to choke it; as shall be shewn in the next chapter.

## CHAP. II.

*Of the Persecution the New Church of Cochin-China endur'd, at its first Institution: and how I was sent thither to be assisting to it, by my Superiors.*

Cause of  
the persecu-  
tion.

THE persecution against the fathers took its beginning from an accident at first sight ridiculous, and of no moment, which afterwards gave them much cause to lament. That year there happened an universal barrenness throughout the whole kingdom, for want of the usual inundation in autumn; which, as was said in the first part, is so necessary for bringing up the rice, the chief support of life in that country. Hereupon their priests, whom they call *om'saii*, held a great council, to find out the cause why their idols were so angry with all their kingdom, that seeing the people starve to death about the fields, yet they were not the least mov'd to compassion for so great a calamity. It was there unanimously agreed, that there was nothing new in the kingdom, so opposite to the worship of the idols, as the admitting of strangers freely to preach up a law there, that utterly contradicted the honour given to those Idols; and that they being justly provok'd at it, reveng'd themselves by denying them their desired rain.

The fa-  
thers ba-  
nish'd.

This being agreed on as a most undoubted truth, according to their ignorance, they presently went in a tumultuous manner to the king, and press that the preachers of the new law may be banish'd all the kingdom, that being the only means to appease the wrath of their gods. The wise king laugh'd at their project, knowing it to be a foolish notion of those priests, and made little account of it, having a great esteem for the fathers, and a kindness for the *Portuguese*. Yet this favour of the king avail'd them but little to oppose the fury of the ministers of Satan; for they so stirr'd up the people to press that the preachers of the gospel might be expell'd the kingdom, that the king, not able to resist without danger of a mutiny, sent for the fathers, and with much concern told them, He was sensible of the folly of the people, and ignorance of the priests; but that it was not prudence to withstand a multitude, so eagerly bent upon such an affair as that was, which was designed for the removing so general a calamity; and therefore they must depart his kingdom as soon as possible. The fathers having heard these words with tears in their eyes, seeing themselves oblig'd to forsake those new and tender plants of Christianity, yet ever submitting to the will of God, went away to embark; but being got aboard, in obedience to the king's command, they could never get out

of the harbour, because at that time a sort of contrary winds, which usually hold three or four months, had begun to blow, which by the *Portuguese* are call'd *Moncao*, or general winds. The *Cochin-Chinese* observing it, would not allow them to return into the city, but oblig'd them to remain upon the shore depriv'd of all human comfort, and expos'd to the burning heat of the sun, which in those parts is very violent. It was a great satisfaction to them in the midst of their sufferings, to see the constancy of some of those new Christians, who never forsook their masters, following, accompanying, and relieving them the best they could, becoming voluntary companions in their sufferings. F. *Buzome* had here a new trial of his virtue; for the uneasiness of this uncomfortable life, in a few days, caus'd an imposthume to break out in his breast, from which abundance of corruption ran, and was a mighty weakening to him.

BORRI.

The infernal fiend, not satisfied to have brought the preachers of the gospel to this miserable condition, made yet farther efforts to discredit their doctrine, and catholic religion, making use to this purpose of one of those *om'saii*, who living a solitary life, was therefore in great reputation of sanctity. This man coming one day from his hermitage, publicly boasted, That by his prayers he would cause the idols immediately to send rain: and without more to do, went away follow'd by an innumerable multitude to the top of a mountain, where he began to call upon his devils, and striking the earth three times with his foot, the sky was presently clouded, and there fell a shower of rain; which tho' not sufficient to supply the want, yet was enough to give a reputation to that minister of hell, and to discredit our holy faith, every one saying, They had not yet seen the foreign priests obtain so much by their prayers of the great God, whose servants they profess'd themselves. This accident troubled the fathers more than the misery they liv'd in: but Providence comforted them by the means of the lady *Joanna* above-mention'd. She, as it were, with a prophetick spirit, bid them not be concern'd at any thing that had happened; for in a little time God would make the hypocrisy of that *om'saii*, and the vanity of his idols, known to all men, by destroying the reputation he had gain'd till then; all which was verified to a tittle soon after. For the same of his sanctity

An hypo-  
crite priest  
of the  
idols de-  
rected and  
punish'd.

**BORRI.** sanctity being spread abroad upon account of the rain, and coming to the king's ear, he presently sent for him, and gave him an apartment in the palace. There he fell in love with one of the king's concubines, and found no difficulty to compass his design; but the matter being known, tho' in *Cochin-China* this be accounted a most heinous crime, and it be death to have to do with a woman the king has once touch'd; yet they could not proceed to execution against him, as being a person sacred among them, but according to the form appointed by their laws. The king therefore gave the sentence, That the *omsai* should vanish; but that he should neither go east, west, north, nor south, nor through any part whatsoever of his kingdom. This decree being publish'd, was immediately executed in such manner, that the *omsai* vanish'd with great shame, and was never more seen in the kingdom, nor out of it.

The church burnt.

But the devil being enraged, vented his fury against God's servants, stirring up the people to fire the church in *Turon*, to the grief of the fathers, who held all from the shore without hopes of redress.

The author in *Cochin-China*.

In the mean while the news of the fathers misfortune was spread all about the neighbouring countries, and even as far as *Macao*, which was a great trouble to the fathers of that college, who pitying their brethren, resolv'd to send them some relief by a *Portuguese* vessel that was ready to sail to *Cochin-China*; and the fathers judg'd the business might succeed the better, if two fathers going in it, one had the name of chaplain of the ship, to return in it; and that the *Cochin-Chinese* might have no cause to complain, or be incens'd, he that remain'd was to go disguis'd: *F. Peter Marques*, a *Portuguese*, was appointed chaplain; and I had the good fortune to be his companion, obedience so ordering it: for tho' I had been destin'd for *China* by our father general, I freely and affectionately embraced the opportunity of dedicating my self to God in the mission of *Cochin-China*, and for the comfort of those afflicted fathers, seeing my self quite shut out of *China*, by reason of the persecution rais'd there. I set out from *Macao* in the habit of a slave, and soon arrived in *Cochin-China* upon my birth day, which was very near opening the way for me to a blessed life; but it pleas'd Providence to order matters otherwise, either because my sins made me unworthy of such a mercy, or for other causes only known to God: as the vessel was entering the harbour, upon which there were abundance of the country people, there happened, I know not how, a quarrel between two *Portuguese*, and one of them falling down for dead, the other leap'd into the sea to

escape the wounded man's friends and companions, who would have kill'd him. He swam a-while, but being tir'd, drew towards the ship again, to save himself from sinking, and endeavouring to catch hold could not, because they were ready above with half-pikes, javelins, and swords, to wound him. I seeing him in that distress, endeavour'd to relieve him; and tho' I was in a servile habit, ran among them, and calling out to one, and pulling another, took such pains that I appeas'd them. The *Cochin-Chinese* who were aboard the Ship, seeing the *Portuguese* pacified at the sight of a slave, began presently to suspect the matter; and knowing by experience, that the *Portuguese*, when in a passion, are not so easily quell'd, unless religious men interpose, said to one another, This man is certainly no slave, as his habit seems to suggest; and being no merchant, as the rest are, he is certainly one of their religious men, that endeavours, contrary to the king's command, to be conceal'd in our country, but we will discover him to the king himself, that he may be punish'd as he deserves. Immediately they flock'd about me, and tho' I did not understand their language, yet I plainly perceiv'd they had all a jealousy of me; and notwithstanding all my endeavours not to discover my self, I could not prevent their sending advice to court. When I had satisfi'd my self as to this point, believing I was certainly a dead man, I resolv'd to die as what I was: accordingly I put on my habit of the society, a surplice over it, and a stole about my neck; and in that habit I began publickly to preach the faith of Christ by means of the interpreter; then erecting an altar on the shore, I said mass, and gave the communion to the *Portuguese* that were present, standing ready for whatsoever it should please God to appoint: But it pleas'd him not that I should then shed my blood for him. Whilst my cause was in hand, it rain'd so abundantly day and night, without ever ceasing, that every man apply'd himself to tilling of the ground, and sowing of rice, and perhaps reflecting that they had obtain'd that at my arrival, which they had so long wish'd for, looking upon it as a good omen; and concluding it was not the fault of the fathers that they had wanted rain, they repented them of all they had done against us, and never gave us any farther trouble, but suffer'd us to live freely throughout the kingdom.

Matters being thus pacified, I resolv'd to go look out *F. Buzome*, and his companion, since I was gone thither to the end; and whilst I was endeavouring to hear some news of him, the report of my arrival being spread about the city, that lady

Charity of  
Japanese  
Christians

Joanna

Joanna also mentioned found me out. By her I understood that F. Francis de Pina, with the Japanese brother, had been privately conveyed by Japanese Christians to the city Faisó, all people certainly concluding that the fathers were then got out of the kingdom. Upon this information, F. Peter Marques, who knew the language of Japan very well, would have us go to Faisó, where we found F. Francis de Pina, who was there hid, but very well used by those good Japanese Christians, to whom he privately administered the sacraments. We received incredible joy in meeting: for besides the general charity of religion, we had been companions, and great friends, in the college of Macao; and the kindness of the Japanese was extraordinary, for they treated us during a fortnight very splendidly, with great demonstrations of affection and joy.

Here I also understood how, through God's special providence, F. Buzome was also safe in the kingdom, as if God had particularly defended him for the good of that mission, where whilst he was upon the strand amidst so many afflictions, and with that impostume in his breast, the governor of Pulucambi came to Turon; who seeing that man so ill used, that he looked like a walking ghost, being moved to compassion asked who he was, and what misfortune had brought him to that miserable condition. He was told all that had happened; and that the want of rain being laid to his and his companion's charge, he had been banished by the king's order. The governor was not a little amazed, and laughed to think that this should be attributed to a poor religious man, which could no way depend of him; therefore he ordered him to be taken from that open shore, and carry'd into one of his galleys, in which he carry'd him to his province, entertained him in his own house, had him looked after by the most skilful physicians in that city, and made his own children attend him during a whole year; for so long his sickness lasted: all men admiring that a heathen should behave himself so charitably towards a stranger utterly unknown to him only out of mere natural compassion.

Thus we were four priests of the society in Cochin-China: F. Buzome, at Pulucambi, one hundred fifty miles from the port of Turon; F. Peter Marques remained at Fal-

só, as superior, and to serve the Japanese; BORRI. keeping F. Francis de Pina for his companion: and I returned to Turon, there to serve the Portuguese, to say mass, preach to them, and hear their confessions, and learning at the same time the language of Cochin-China, endeavoured, with the assistance of the interpreters, to persuade some of those heathens to be baptized; and above all, to encourage and confirm those that were already baptized. Soon after my first coming, their happened a mean accident worthy to be known: I was called to make a dying infant a Christian; I did so, and soon after it gave up the ghost. I was concerned, not knowing where to bury it, which made me think of fixing a burying-place for all the Christians that should die for the future. To this purpose I ordered a mast of a ship that was cast by, to be taken, and a stately cross to be made of it: which done, I invited all the Portuguese, and sailors, to help to carry it to the appointed place, I attending with my surplice and stole. Whilst the hole was digging to erect the holy cross, a company of armed men came out from the neighbourhood, who with their muskets threatened to kill me; which I perceiving, caus'd the interpreter to endeavour to know of them, what it was they would be at? And was told, they would not have that cross erected there, because they feared the devils would infest their houses. I answer'd, It would be quite contrary; because the cross had such a virtue, that it put the devil to flight. With this they were so well pleased, that laying down their arms, they all ran to help: and thus the cross was set up to the general satisfaction of all parties, and the burial-place fixed. Soon after the governor of Pulucambi came thither, and brought F. Buzome with him; and we met all four fathers of the society, to our unspeakable joy at Faisó, together with two lay-brothers, one a Portuguese, and the other a Japanese. After a charitable reception, we consulted together about the most proper means of promoting that mission. It was unanimously agreed, that F. Peter Marques should stay at Faisó with the Japanese brother, because he was a good preacher; and the other three, with the Portuguese brother, should follow the governor of Pulucambi, who earnestly desired it; which was accordingly done, as shall be here related.

## CHAP. V.

*The Governor of Pulucambi introduces the Fathers of the Society into his Province, building them a House and Church.*

**BORRI.** *F. Francis Buzome, F. Francis de Pina,* and I, set out from *Faisú*, for *Pulucambi*, with the governor of that province; who all the way treated us with inexpressible courtesie and kindness, always lodging us near himself, and behaving himself in such manner, that there being no human motives to incline him so to do, it plainly appeared to be the work of Providence.

Great goodness of the governor of Pulucambi  
He appointed a galley only to carry us and our interpreters, not suffering so much as our baggage to be put aboard it, but ordered another boat for it. In this easie manner we travelled twelve large days journey, putting into a port morning and evening, and all the ports being near great towns or cities of the province of *Quangbia*, in which province the governor had as much power as in his own at *Pulucambi*; all people ran to pay their respects and acknowledgments, bringing him rich presents, the first of which always fell to our share, he himself so ordering it, every one admiring to see us so honoured; which gained us much esteem and reputation among those people, that being the design of the governor: and this was much forwarded by the great account he made of our intercession, when any criminal was to be punished: for we no sooner opened our mouths, but we obtained all we desired; by which means we not only gained the reputation of being great with the governor, but of having compassion and kindness for those people, who therefore loved and respected us. Besides, during the whole voyage, he treated us as if we had been some great lords, contriving sports and pastimes in all parts, causing the galleys sometimes to represent a sea-fight, sometimes to row for rewards. Nor did there a day pass but he came aboard our galley to visit us, seeming much pleased with our conversation, especially when we discoursed of religion and our holy faith. In this manner we came to the province of *Pulucambi*, thro' which we had still some days journey to make, before we arrived at the governor's palace, who for our greater diversion would have us travel by land. To this purpose he ordered seven elephants to be provided; and the more to honour us, would have one for each, causing an hundred men, some on horseback, and some a foot, to attend us: and the journey being for recreation, we spent eight days in it, being royally entertained wheresoever we

came; but particularly in the house of a sister of his, we had a most splendid entertainment, not only for the variety and number of dishes, but much more for the rarity of the dressing, all things being dressed after the *European* manner, tho' neither the governor, nor any of the family were to taste of them.

Being at length come to the governor's palace, all the entertainments and dainties of the journey concluded in such a reception as he used to make for kings and great princes, treating us for eight days together in most splendid manner, making us sit in his royal throne, and eating with us himself in publick, with his wife and children; to the great astonishment of all that city, where it was unanimously affirmed, such a reception had never been seen, unless it were for some royal person: and this was the cause of the report generally spread throughout the kingdom, that we were a king's sons, and were come thither about matter of great concern; which being known by the governor, he was mightily pleased; and before the chiefest men of the court he publicly said, *It is very true, that the fathers were the sons of a king, for they were angels, come thither, not for any want or necessity of their own, being provided with all things in their own countries, but only out of pure zeal to save their souls: And therefore he advised them, to give ear to the fathers, and observe the law they would preach to them, learn the doctrine they taught, and receive the faith they delivered: for (said he) I have often discoursed and conversed with these men, and plainly perceive by the doctrine they teach, that there is no true law but theirs, nor no way but that they shew, which leads to eternal salvation. But take heed what you do, for unless you learn that true doctrine, which I, your chief, bring to you by means of these fathers, your neglect and infidelity will be punished eternally in hell.* Thus spake that lord, becoming a preacher of the gospel, tho' himself a heathen; all men being the more amazed and astonished at it, because of the great conceit they had of his wisdom.

After the first eight days, we gave him the favour to understand, that we would rather go to live in the city, the better to promote the preaching of the gospel, which we could not so well attend in the palace, because it was three miles from the city, in an open field, according to the custom of the country. The governor would not have parted with

His grandeur, and affection to the fathers.

The fathers settled.

A new way built church.

with us, because of the great affection he had for us, but preferring the publick good before his own satisfaction, he immediately ordered there should be a very convenient house provided in the city *Nuocman*: and moreover told us, we might see above a hundred houses that were about his palace, and take our choice of the convenientest of them, to make a church of it; and acquainting him with it, he would provide all that was necessary. We returned him thanks for so many favours bestowed on us during our journey, and those we still received. Having taking our leaves for the present, we mounted the elephants again, and with a great attendance went away to the city *Nuocman*, which extends itself five miles in length, and half a mile in breadth, where we were by the governor's order received with extraordinary honour. He not being able to endure to be so far from us, came the next day to visit us, to know whether the house we had given us was convenient; and told us, he knew that we being strangers, could not have money and other necessities, but that he took upon him to provide every thing; and immediately ordered a good sum to be paid us monthly, and every day flesh, fish, and rice to be sent in for us, our interpreters, and all the servants of the house: and not so satisfied, he frequently sent us so many presents, that they alone were sufficient to furnish us plentifully with all things. The more to honour and credit us among all men, he one day gave publick audience in the court of our house, in the manner as we said above was practised in *Cochin-China*. Here several criminals were tried, every one receiving sentence according to his crime; among the rest, two were condemned to be shot to death with arrows, and whilst they were bound we undertook to beg their pardon, which was immediately granted, and he ordered them to be discharged, publicly protesting, he would not have done it at the request of any other, but to these holy men, who teach the true way for the salvation of souls, (said he) I can deny nothing; and I am myself impatient to be rid of those impediments that obstruct my being baptized, and receiving their holy faith; which is what you all ought to do, if you desire to oblige me.

A rare way of building a church.

Then turning to us, he again desired we would appoint the place for the church, that he might give orders for its speedy fitting up. We shew'd him a place that seem'd convenient enough, and he approving of it, went away to his palace. Before three days were over, news was brought us, that the church was coming: we went out with great joy, and no less curiosity,

to see how a church should come, which tho' we knew was to be made of timber, as had been agreed, yet it could not choose but be a great pile, according to the space it must fill, standing upon great pillars. On a sudden, in the field, we spied above a thousand men, all loaded with materials for this fabrick. Every pillar was carried by thirty lusty men; others carried the beams, others the planks, others the capitals, others the bases; some one thing, some another, and so all of them went in order to our house, filling all the court, which was very large, to our unspeakable joy and satisfaction. One only thing displeased us, that we had not provisions enough in the house, to give so great a multitude a small entertainment; for tho' they were paid by the governor, yet it looked like ill-breeding to send them away without some refreshment: but we were soon eased of this trouble; seeing every one sit down upon the piece he brought, being obliged to keep and deliver it, and take out of his wallet, his pot with flesh, fish, and rice, and lighting a fire, fall to cooking very quietly, without asking any thing. When they had eaten, the architect came, and taking out a line, view'd the ground, mark'd out the distances, and calling those that carried the pillars, fixed them in their places; this done, he called for the other parts, one after another, that every man might give an account of what he brought, and go his way: and thus all things proceeding very regularly, and every man labouring his best, all that great pile was set up in one day; yet either through over-much haste, or the negligence of the architect, it proved somewhat awry, and leaning to one side; which being made known to the governor, he presently commanded the architect, upon pain of cutting off his legs, to call all the workmen he had need of, and mend it. The architect obey'd, and taking the church to pieces with a like number of workmen, rebuilt it in a very short time very completely. And we blessed God, for that a time when Christians were so lukewarm, it had pleased him to stir up a heathen so zealously to build a church, in honour of his Divine Majesty.

And to shew how affectionately the governor looked to our affairs, I will give one particular instance, and so end this chapter. In the months of *June, July, and August*, the south-west winds generally reign in *Cochin-China*, which causes such an extraordinary heat, that the houses are perfectly parch'd and dried up; and being all of wood, the least spark of fire, that through negligence or other accident falls upon them, immediately takes, as it would

**BORRI.** would do in tinder; and therefore during those months, there are generally great fires throughout the kingdom; for when it has taken hold of one house, the flame soon catches hold of those that lie the way the wind blows, and miserably consumes them. To deliver us from this danger, our house being in the middle of the city, and to make it farther appear what esteem the governor made of us, he put out an

edict, commanding, that the tops of all the houses that lay south-west of us, should be taken off; and there were so many of them, that they extended at least two miles; which he did to the end, that if any of them took fire, it might be the easier to prevent its passing forward to ours; and this was readily performed by them all, by reason of the great respect they bore us.

#### CHAP. IV.

##### *Of the Governor of Pulucambi's Death.*

**O**UR affairs advanced very prosperously in this city, and it was now the time, when the Providence was, according to the method, to give us a taste of suffering; where-with God frequently tries his servants; and so we ever see he gives such a mixture of prosperity and adversity, that they neither be depressed by the one, nor puffed up by the other: and as the primitive church was founded by the holy apostles upon these two pillars of prosperity and tribulation, even so it pleased the Almighty, that the new church of *Cochin-China* should be established by his apostolical ministers. The first beginnings of this mission were very successful, as has been seen in the first chapter of this second part; but very soon after ensued that terrible persecution for want of rain, which had like to have ruined all. Afterwards, with the favour of the governor of *Pulucambi*, the storms seemed to be blown off, and the budding vine seemed to promise abundance of fruit: but it pleased him that disposes of all things, that the governor of *Pulucambi's* death, like a violent north-wind, almost destroyed all in the bud. This misfortune happen'd as follows: the governor went out one day a hunting on his elephant, very well pleased, and the sport drawing him on, he made no reflection that he rode all day over a scorching plain, where the heat pierced his head in such manner, that at night he fell into a burning fever; upon notice whereof, we hastened to the palace to visit, or rather to baptize him, if we found him in imminent danger. He kept us with him two days, we still pressing him to be baptised, as he had often said he would; to which he always answered, he was ordering his affairs for that purpose, but came to no conclusion. The third day he lost his senses, God so permitting, for causes only known to himself; and perhaps that vain honour he ever passionately coveted, was the reward of the good turns he did us: in fine, he began to rave, and so continued three days, till overcome

by the violence of the distemper, he died without baptism.

Any man may guess how much we were concerned at this accident, seeing ourselves forsaken in a strange country, and destitute of all human help; but it chiefly grieved us, that a person so well disposed, and through whole means we had conceived hopes, that the faith might spread throughout the whole kingdom, should die so in our hands without baptism. Abundance of their rites and superstitious ceremonies were performed at this governor's death, at which we were present till the last. It would be endless to relate them all, and therefore I will set down two or three, by which the others used by those gentiles upon such occasions may be guessed at. First, whilst he lay in his agony, there was a multitude of armed men, who did not cease to cut and make thrusts in the air with their scimitars, cast darts and fire muskets in the rooms of the palace; but particularly two, that stood on each side of the dying man, were continually striking the air about his mouth with their scimitars, and both these and the others being asked, why they did so, told us, they frightened the devils, that they might not hurt the governor's soul, as it was departing his body. These superstitious ceremonies made us pity their ignorance, but not fear any harm to our selves, as followed when the governor was dead: for we had much cause to fear being expelled that province of *Pulucambi*, and perhaps all the kingdom, with the loss of all we had acquired towards settling Christianity, and perhaps worse. It is the custom when any great person dies, for all the *om/sais*, or priests of the country, to meet together, in order to find out not the natural, but the superstitious cause of his death; and being agreed upon what it may be, immediately that thing to which it is attributed, is ordered to be burnt, whether it be a house, garment, man or beast. Accordingly all the *om/sais* being assembled in a great hall, they began to argue this point:

Heathen ceremonies at the governor's death.

The governor's death.

Sord  
died  
the  
of t  
foul  
part

we who were present, remembering the persecution for want of rain, there being at that time nothing extraordinary in the province, but the governor's kind reception to us, and his assigning a house, and building a church in the city, with such extraordinary tokens of affection for our holy law; did not at all question, but that these things being represented to them, they would lay the death of that lord to our charge, and consequently would order us all to be burnt alive, together with our house and church, and all our goods. Therefore we stood in a corner of the hall, recommending our selves to God, and preparing our selves for whatever his Divine Majesty should suffer to be decreed against us; when one of the *omfais*, who was the eldest of them, and as it were their dean, standing up, said with a loud voice, that, in his opinion, the only cause of the governor's death, was the falling of a beam some days since in the new palace; and he was the more apt to believe it, because all the distemper was in his head, as appeared by his raving; an evident sign, as he said, of the stroke he had received in his head by the aforesaid beam: all which he meant metaphorically, and in a superstitious sense, and therefore it pleased the other *omfais*, who all unanimously agreed in the same sentiment: and so rising without more to do, they went and set fire to that palace, which was all reduced to ashes, whilst we gave thanks to God for having escaped to manifest a danger.

Sorcery to discover the state of the soul departed.

This done, some other *omfais*, who profess necromancy, came to the governor's palace, to perform another superstitious ceremony, according to the custom of the country. The kindred of the party deceased looking upon it as a great blessing, that any body inspired by an evil spirit, should speak concerning the state of the soul departed; and to this purpose those wizard *omfais* were called, of whom they all earnestly beg that devilish favour, he that obtains it being much envied by the rest. These conjurers made their circles, and used several charms both in words and actions, that the devil might enter into some one of the governor's kindred, who were there in a suppliant posture, but all in vain. At last a sister of the governor's, for whom he had an extraordinary kindness, came in, and begging the same favour, immediately gave manifest signs that she was possessed: for being decrepid, by reason of her great age, and not able to go alone, she began, to the astonishment of the spectators, to skip as nimbly as if she had been a young girl, and the stick she threw from her hung in the air, all the while the devil was in her body,

Vol. II.

during which time talking in a raving manner, and doing many disorderly actions, she uttered several extravagancies about the state and place her brother's soul was in; and concluding her mad discourse, the devil leaving her, she fell down as if she had been dead, remaining so spent for the space of eight days, that she could not stir for meer weakness, all the kindred and friends flocking to visit her, and congratulate her happiness, in that she had been chosen among all the relations for an action (as they thought it) so glorious and honourable for the dead man.

At length they began to order the funeral of this lord; and as in the catholic church it is the custom to honour the memory of men renowned for sanctity of life, by a solemn canonization; so in *Cochin-China*, the devil always mimicking holy things, the more to delude the people, it is customary to honour the death of those who have been universally reputed just men, and upright in their actions, and adorned with moral virtues, with great solemnity and magnificence, canonizing them, if we may so call it, after their manner, by eternizing their memory, and giving them immortal veneration. For this reason, the governor of *Pelucambi*, who by all men, not only in his own province, but throughout all the kingdom was, for his extraordinary natural parts, reputed a man of great wisdom, and incomparable prudence, his government being adorned with singular justice and integrity, together with an unusual inclination and affection for all needy persons, was judged not to require a dolorful sad funeral pomp, as was due to others; but on the contrary, all demonstrations of joy and grandeur, which might declare him worthy of religious honours, and to be added to the number of their gods. This being decreed, they all endeavoured to lay aside their mourning and sorrow, and to express all pleasure and satisfaction; and to this purpose all the governor's kindred, for the space of eight days, sumptuously treated all the people, during which time, they did nothing from morning till night, but eat and drink, sing, dance, and play upon musical and warlike instruments.

After the eight days, the body was carry'd in a silver coffin gilt, under a canopy, to the city where he was born, called *Cbisu*, three days journey distant, attended by a multitude of all sorts of people, dancing and rejoicing, leaving the palace where he died utterly disinhabited, that it might run to ruin, and no sign of it remaining; so the memory of the governor's death might be lost in perpetual oblivion, he still remaining alive with perpetual praise and veneration in the

9 E

hearts

BORRI.

Heathen canonization.

The governor's funeral.

**BORRI.** hearts and mouths of all men. Being come to a spacious plain without *Cbisu*, they all fell to work upon a palace, twice as magnificent and sumptuous as that the governor died in; and to make a greater shew of the dead man's wealth, they built as many galleys as he used to keep, upon wheels, for them to run upon dry land. In the same manner they made wooden elephants and horses, and all other moveables used when the governor went abroad when alive, without sparing any cost. In the midst of the palace they erected a stately temple, with a fine altar, on which they placed the coffin covered, and hid with such curious workmanship, that the hieroglyphicks, carving, and painting, greatly move those gentiles to respect. For three days continually they performed several sacrifices and ceremonies, by the ministry of five or six hundred *om/aiis*, all clad in white, who spent the time in singing and sacrificing, offering wine, oxen, and buffaloes, in great numbers, the public entertainments continuing these three days, for above two thousand men of note, every one having his table to himself, according to custom, and each of them covered with above two hundred dishes. At the end of these three days they set fire to all that pile, burning the palace and temple, with all the perfumes and furniture, only saving the coffin with the body, which was afterwards buried, and privately removed to twelve several graves, that the people being always in doubt where it had been left, that uncertainty might increase the honour of the new idol, they adoring it in all those places where they thought the bones might be. Thus the solemnity ended for that time, till some months after, that is, in the seventh moon, according to their computation of time, it was repeated in the same manner as it had been performed at first; a few months after it was done a third time, and so from time to time for three years, all the revenues assigned the governor of that province by the king, being spent upon this solemnity for those three years, and therefore no other governor was appointed during that time, they being persuaded that the dead man's soul, which was placed among the gods, would continue in the government for those three years. However, his own son was appointed his deputy-governor, or lieutenant.

The fathers questioned concerning the governor's soul.

We three fathers of the society then in that province, were present at most of this solemnity; and tho' we did not attend at their superstitious ceremonies, yet to avoid being thought ungrateful and unmannerly, we were forced to accept of some invitations, in one of which we were forewarned

we should be asked where the governor's soul was; assuring us, that if we said it was in hell, we should presently be cut to pieces. We were a little after publicly asked the question, and answered, That no man could be saved without baptism; but that through the mercy of God, and earnest desire to be baptized sufficing, where better cannot be; if the governor, at last, had such a desire, as it was likely he had, because of the affection he bore our faith, as we said above, and that he would have asked it, but that the violence of his distemper hindered, therefore it might be believed he was saved, and not damned.

This answer, tho' new and unexpected, in some measure satisfy'd them, in token whereof they offer'd us some whole buffaloes, some boiled, some roasted, which had been sacrificed to their new idol, the dead governor; but we refusing them, saying, Our law forbid us to eat of that flesh so defiled by their sacrifice: instead of the dead sacrificed buffaloes, they ordered others alive to be given us; the governor's kindred afterwards sending us elephants, that we might return on them to *Pulucambi*, with as much honour as when the governor was living.

These were the last favours we received <sup>The favour in virtue of the governor of *Pulucambi*'s there in distress.</sup> in favour; and therefore returning home, we were left like fatherless children, forsaken by all the world. Now no body minded us, the allowance of rice for our maintenance failed, and we having but twenty crowns must in a few days have been reduced to great misery and want; and if any one fell sick, we durst not call any body to breath a vein, because we had not wherewithal to pay for it; and tho' there were among them people very ready to supply the needy, esp.ially with sustenance, as was said above, yet it was not convenient for us to ask any thing, lest we should lose all the advantage we made, as to the conversion of souls, because they would have said, we went not thither to preach the law of *JESUS CHRIST*, but to supply our wants under the protection of the governor. No body now came to our house, that first shew of authority ceasing, and tho' we had learned the language of the country, yet they made no account of the words of three poor men, left in the midst of infinite idolaters, and despised our doctrines, as an invention of our own, carried thither to oppose the ancient sects and tenets.

Three years pass'd after this manner, and yet we were not so much troubled at our own wants, which God knows were very great, as to see every day less hopes of promoting the service of God among those

those pagans, having during those three years converted but very few, and that with unpeakable labour and toil. Things being in this posture, in some measure desperate, we being inclinable to believe the time was not yet come, when it would please God to enlighten the darkness of those people, either because our sins obstructed it, or for some other hidden judgments of God. But when our human frailty shewed it self most diffident of di-

vine assistance, even then, the more to comfort us, the God of mercy shewed the wonderful effects of his divine omnipotency, that the noble undertaking of converting souls might be wholly attributed to him, we then owning we had no power to proceed in it, and that we might know experimentally, that *neither be who waters, nor be who plants, does anything; but it is God that gives the increase;* as will appear in the following chapter.

## CHAP. V.

*How God made way for the Conversion of the Province of Pulucambi, by means of the noblest Persons in it.*

The fact here differs.

WE having nothing to maintain us at Pulucambi, and converting no body, dispersed our selves into several parts: F. Francis de Pina went to live at Faifó, a Japanese city, as has been said, with a design to serve those Christians, whose pastor he had been before, and to live upon their alms. He being well skilled in the language of Cochin-China, and talking it naturally, never ceased there to preach our holy faith. F. Francis Buzome went away for Furon, carrying along with him the best interpreter we had, to endeavour to obtain some alms of the Portuguese there, that might at least maintain us two in Pulucambi, in our house at Nuocman, till some supply came from Macao.

Conversion of a great lady.

Thus was I left in Pulucambi, solitary and disconsolate, without any hopes of the conversion of those gentiles. When one day being at home, far from any such thought, I saw a number of elephants before our door, with many ladies, and a large retinue of gentlemen, after whom followed a great lady, and principal matron, most richly clad, and adorned with abundance of rich jewels, according to the country fashion. I was much surprized at the unusual spectacle, and majesty of the lady, and in suspense, not imagining what might be the design of the new visit. Going out at last to receive her, I understood she was wife to the ambassador the king of Cochin-China was sending to the king of Cambogia, which ambassador was a native of Nuocman, where we dwelt, and next the governor the chief man in that city, who was then at the court of Sinus, treating with that king upon the subject of his embassy. After the usual ceremonies and compliments, according to the custom of the country, the lady being unwilling to lose time upon matters that were not to her purpose, *Let us come (said she) to the business I aim at; I have been fully informed, father, of your coming into this our country and province, and of*

*the occasion of your coming; I see the holy and unblemished life you lead, I know you preach and teach the true God; and being satisfied that this is most agreeable to reason, am persuaded that there is no true law but yours, nor other God but yours, nor any way to life everlasting, but that you teach; and therefore my coming to your house, is for no other intent, but earnestly to beg of you, that bathing me in your holy water, you will add me to the number of Christians; this is the utmost of my wishes and desires.* In the first place I commended her good and holy resolution, exhorting her to return thanks to God for so signal a mercy bestowed on her, in calling her to the knowledge of his holy law, there being nothing in this world to be valued equal to the soul's salvation. Next I made my excuse for not complying out of hand with her pious and reasonable request; because, altho' I had some knowledge of the Cochin-Chinese language, yet it was not enough to instruct her in the lofty mysteries of our christian religion; and therefore I advised her excellency to wait for F. Buzome, who in a few days was to return from Turon, having with him an excellent interpreter, by whose means she would be instructed as she ought to be to her own satisfaction, and obtain the end of her holy desires. *The great fire (replied she) that inflames my heart, will not allow of such a long delay; and the more, for that my husband is hourly expected from court, with whom I am soon to embark for the kingdom of Cambogia, where the dangers of the sea being frequent, a storm may happen to rise, where dying, I may perish for ever.* She added, that it was enough if I dis-couraged of matters divine, as I did of other things; for she should understand all I said. These visible tokens of her resolution obliging me to it, I began the best I could to inform her in several matters and principles of our holy faith. Soon after it pleased God, F. Buzome returned, and seeing this good success, gave infinite thanks to

**BORRI.** to God. The lady was much pleased with the arrival of the interpreter, whom she had so earnestly expected; with whose assistance, and her continual application, study, and attention at catechizing, which was done for two hours before and two hours after dinner, in a fortnight's time she became perfect in the christian doctrine. Above all, what made the greatest impression on her heart, was the knowledge of JESUS CHRIST, true God, made man, and humbled for the sake of man; and therefore in some measure to imitate our Saviour's great humility, she for the future came to our house, which was a good mile from hers, not only without the state and elephants she used before, but bare-footed, in dirt, and upon stones, obliging her gentlemen and ladies, by her example, to imitate her devotion.

In our spiritual discourses, and exposition upon the catechism, when we came to make mention of hell, describe its torments, represent the greatness, eternity, and variety of torments there suffered, the horrible company of devils, the darkness of those infernal dungeons, and uninhabitable dens; and lastly, the torture of fire: both she and her ladies were so terrified, that having by themselves, all night, considered upon what they had heard, they came again the next day to tell us, they would all be Christians, to avoid that everlasting misery: But we telling them it was impossible, they being servants, and consequently concubines to the ambassador, according to the custom of the country, as has been mentioned in the first treatise, the ambassador's lady answered, *That impediment does not concern me. It is so, said we, for your excellency is your husband's only wife, and has not to do with other men, and therefore may freely be baptized.* At these words, lifting up her hands to heaven, she gave such tokens of joy, as if she had been besides her self, tho' she had never been truly so much her self, as when she shewed such signs of joy, for that which ought to be the only cause of all our satisfaction. Her women on the other side, seeing themselves excluded the way of salvation, cried out aloud, they would forbear being the ambassador's concubines, since it obstructed their baptism, and was the way to damnation. The lady seconded their good purposes, taking upon her to deliver them from that sin, and get every one of them a husband. All lets and impediments being removed by these promises of the lady, and firm purposes of the women, one day, which was the joyfullest I ever saw in my life, the ambassador's lady richly apparelled, and dressed with jewels, and nobly attended to our church by gentlemen, was baptiz-

Twenty  
six baptiz-  
ed.

tized, with twenty five of her women, and as chief of them called *Urfula*, to the glory of JESUS CHRIST, who by means of these few women, opened a way to the conversions made by our mission in *Cochin-China*.

After they were baptized, we went in procession to the palace of the ambassador's lady *Urfula*, where there was an oratory, in which she used before to perform her superstitious devotions to an idol. When we came in, we first sprinkled the house with holy water, and then the lady, and her women, courageously laid hold of the idol, and throwing it violently against the ground, beat it to pieces, trampling on it; in whose place we set up a fine picture of our Saviour, which those new devout Christians falling down, devoutly worshipped, owning themselves his most humble and devout slaves. Then we put about their necks some *Agnus Dei's*, crosses, medals, and relics, which they valued above the gold chains, and strings of pearls they were adorned with. Having obtained this victory over the devil, after saying the litany, and other prayers in the oratory, now blessed, *F. Buzome*, and I, returned home with that satisfaction and thanksgiving that every man may imagine. The ambassador's lady, and her women, came after this, every day duly to mass, catechize, and other spiritual exercises, with great tokens of fervour, and christian piety.

At this time the ambassador, husband to the lady *Urfula*, came from court, to depart in a short time upon his embassy to the king of *Cambogia*. It is the custom of that country, when the head of the family comes from afar off, for the wife, children, and rest of the family, to go out at least a mile upon the way to meet him. The lady *Urfula* failed to perform this ceremony, being then retired in her oratory. The husband wondering at it, and suspecting she might be hindered by sickness, asked what was become of her; but understanding she was well, admired it the more, till coming to the gate of his palace, and missing the usual reception, he began to mistrust she was angry with him. At length he went up, and into the oratory, where he found his lady and her maids, with *Agnus Dei's*, and relics about their necks, beads in their hands, and other christian signs, praying before the image of our Saviour. The ambassador was astonished at this sight, and his lady directing her discourse to him, bid him not admire that she had forbore the usual compliments to him, because she was raised to a higher pitch of honour than he was, both she and her women being children of the true

The lady's  
carriage to  
her husband.

true God, and Saviour of the world, Jesus Christ, whose picture she shewed him, saying, he ought to adore him, if he would be equal to them in dignity. The ambassador moved by his lady's words, and the beauty of the picture, with tears in his eyes fell down and adored; then standing up, he turned to his wife and women, saying, *How is it possible you should be Christians? Have you a mind to leave me? Do not you know that the law the fathers preach forbids polygamy? Therefore you must either find another dwelling-place, or I leave this to you, and seek out another house.* His lady answered, *Neither need you depart, nor we leave you, for there will be a remedy for all things.* Wisely concealing for the present, the prohibition of plurality of wives, to avoid that difficulty which would have bred a disturbance. The ambassador took heart at these words, and conceiving, as yet, that he need not be obliged to leave his women; thus piously imposed upon, he said, he would be a Christian too, and follow the good example set him by his wife, and her women.

The ambassador instructed

The next morning betimes the ambassador came to our house, to tell us, that since we had made his wife a Christian, he had a mind to embrace the same religion, if we thought it practicable. Very practicable, said we, full of joy and satisfaction at so grateful a question? For in case he were resolved, we would in a short time instruct him sufficiently to be baptized. He was pleased, and because the affairs of his embassy took up the day, so that he had not leisure to be instructed: upon his request we agreed to go to his house at night, where we began to catechize him, continuing it for twenty nights, four or five hours at a time, informing him in the mysteries of our holy faith, from the creation of the world, till the redemption of man, the glory of heaven, and pains of hell. It was no small matter for so great a person, and so full of business, to lose his sleep to hear the word of God; and he gave himself to them with great application, asking many very ingenious questions, which shewed his great wit. In all our discourses, our whole aim was to imprint the truth of our holy law in the heart of this noble man, and make it agreeable to reason, that being made sensible of the great importance of salvation, and the terror of the pains of hell, and being well inclined to, and convinced of the certainty of our religion, he might afterwards make less difficulty in the main point concerning polygamy; which was the only thing he stuck at, and which we till then had designedly forbore to speak of. Having gone so far towards the ambassador's

Vol. II.

conversion, we began to expound upon the commandments, where we informed him, that among Christians it was unlawful to have many wives.

This proposition was so unexpected, that like fire that has water thrown on it, the ambassador presently cooled, and taking leave of us, said, this was a matter of great consequence, and therefore required time to come to a resolution. This answer was so displeasing and grievous to us, that returning home we spent that night in prayer and mortification, praying to God with all the fervour we could, that he would be pleased to put a happy conclusion to the work he had so well begun. Next morning one of the most learned *onassis* in the city came to us from the ambassador, to examine the reasons for the prohibition of polygamy. Among other objections, this man made one, in his opinion, of the greatest force, which was, Why plurality of wives should be forbid, since generation and children were a work of perfection, and so agreeable to nature, chiefly when a man had a barren wife, as was the ambassador's case, and might not have another to get heirs upon. We wanted not answers according to our divinity, but perceiving they were not satisfactory to them because they were not used to our theological notions, we at last added a reason out of scripture, whereof the ambassador had before some knowledge from us, and it pleased God, this made an impression on his heart, and absolutely convinced him. This was putting of him in mind, that God being so just, and the law he had prescribed so agreeable to natural reason, as he himself had owned, he ought without doubt to obey in this point, since God himself commanded it; and this so much the more, in regard that God creating man, intimated the same to him, when there was most occasion for propagating human race; and yet he gave Adam but one wife, whereas he could as easily have given him many more, that man might multiply the faster. This reason, I say, fully satisfied the ambassador, yet finding it difficult to observe the precept, as being a thing he was much addicted to: *Is there no remedy, said he, or dispensation from the pope, or any other means, tho' never so difficult, to have this point remitted?* We told him, it was in vain to seek any redress whatsoever in this case; and therefore, if he desired to be saved, he must dismiss the other women, and stick to his wife. Then the ambassador lifting up his eyes and hands to heaven, as it were struggling with himself, and presiding on by truth, with a generous resolution said, *If then multiplicity of wives be inconsistent*

BORRI.

Convinced about polygamy.

The lady's carriage to her husband.

**BORRI.** *sistent with my salvation, let them all go in the name of God; for it is pity to lose an eternity of glory, for a transitory delight.* Then turning to his concubines, who were present with his wife, he discharged them all: but perceiving they laughed at his discharge, as a thing that would never stand good; to shew he was in earnest, he ordered his wife to pay them all off immediately, and let not one of them stay in his palace that night. After which turning again to the fathers, *Behold, said he, I have readily performed all you commanded me.* Having obtained our desires, we went home to give thanks to Almighty God.

His conversion.

But the devil found out a way still to make opposition, making use of the lady *Ursula's* womanish temper; for she had not the heart to turn away those women she had bred up from their infancy in her house, and loved them as if they were her own children. Therefore some strife arising between the man and his wife, he pressing to have them gone, and she opposing, the ambassador dissatisfied, came to us to justify himself, and desire to be baptized, since the impediment was removed, he being willing the women should depart his house. We were about going to work, perceiving he spoke rationally, and particularly because he resolved they should not continue in his house as his concubines, but as his lady's servants. But the good man making a stand as if he were thinking, at last said he had a scruple to propose: *Since, according to what you fathers have taught me, said he, God sees into the heart of man, and cannot be deceived, tho' I desire to forsake and send away the women, yet whilst they continue in the house, I plainly see, either my ancient habit, or frailty of nature will easily cause me to fall again into sin; therefore methinks I do not proceed with due sincerity in this affair.* We perceiving, by the ambassador's discreet and christian discourse, he foresaw the danger of being in the immediate occasion of sin, studied some proper means to remove so considerable an impediment, but nothing occurring for the present he himself being very earnest upon the business, proposed a method, which we stuck to as the best of all others: *Fathers, said he, the safest way I can think of is that you as their directors powerfully persuade the christian women that were my concubines, (for the heathens I will infallibly make my wife turn away) that in case through frailty I should be under any temptation they resist me resolutely; and so much as I bear a great respect to, and stand in awe of our Saviour's picture placed in the oratory, if the women lie in that place, I will rather be torn to pieces than have any*

*thing to do with them in the presence of that great Lord; and they being thus secured against me, till there be an opportunity of marrying them, it will be known abroad, that they are not kept in the house as my concubines, but only as servants to my only wife Ursula, and the people will be sensible I do not act contrary to the law of God.* This method was so well approved of, that the day after it was put in execution, the ambassador was baptized in great state, attended by drums, fifes and other instruments, and he himself clad in rich apparel. With him were baptized twenty other gentlemen, his best friends, and he had the name of our holy patriarch *Ignatius* given him. After which, taking his wife *Ursula* by the hand, she renewed the old contract of matrimony as a sacrament of the church. The joy they all conceived at their baptism, and new marriage, was unspeakable.

It now remained that the ambassador should depart on his embassy for *Cambogia*; and he ordered, that the ship which was to carry him, should have a cross in its colours, and the picture of the glorious father *S. Ignatius* his protector, causing all the jacks and pennants to express the religion he professed. Embarking with all his gentlemen and christian women, he had a prosperous voyage from *Nuocman* to *Cambogia*. When the Squadron appeared, being well known to the people of *Cambogia* to be the ambassador's, they were all astonished, seeing christian colours set up; and therefore they imagined that the king of *Cochin-China*, instead of the ordinary ambassador, had sent some extraordinary *Portuguese* Christian; but their doubt was soon cleared, seeing the usual ambassador land with a cross and medals on his breast, among the gold chains and jewels. This sight on the one hand, moved the *Portuguese* and *Japanese* Christians, who reside there on account of trade, to give shouts of joy, and bless God for this new off-spring *Cochin-China* had produced; and on the other, the heathens could not believe that the ambassador, who before was observed to be excessively lascivious, should embrace the christian religion, which forbids all immodesty. But the grace of the holy Ghost soon appeared to strengthen human frailty; for tho' the ambassador at his palace in *Cambogia*, had double the number of concubines, as generally used to attend his wife, he ordered them to be all dismissed; nor did he ever lift up his eyes to look at them, which made his fame spread abroad, as of a man of singular sanctity and virtue; and being reputed a man of great knowledge, his example moved many of the most learned persons of *Pulacambi* to be baptized.

the *Cochin-  
Chineſes*.

GOD's infinite mercy, and his ardent desires for the ſalvation of mankind, finds out divers means ſuitable to the ſeveral conditions of perſons, which are as it were ſo many ways to direct and lead them to that end for which they were created. Thus we ſee he himſelf in perſon called upon his people, and complying with the inclination of the perſons, invited the wiſe men by means of the ſtar; *Denis* the *Aeropagite* the aſtronomer, by the prodigy of the wonderful eclipse; *S. Auguſtine* by the knowledge of the true light and law, and the confuſion and obſcurity of former errors; and in fine, he calls the ignorant multitude, by the means of prodigies, wonders and miracles. So it fell out in the new church of *Cochin-China*; for when his divine majeſty had by himſelf convinced ſome of the principal perſons, as has been ſhewn, next he call'd not only the learned and wiſe philoſophers and mathematicians, by means of ſome eclipses, as ſhall be ſhewn in this chapter, but alſo the *onſais* or prieſts, who were hardened in the errors of their heathen ſects, to the knowledge of the true religion, as the following chapter will make appear. And laſtly, in the next to that we ſhall ſet down, how he opened the way of ſalvation to the people by means of ſeveral prodigies and miracles.

Aſtrology  
in great  
eſteem.

Now to come to the manner of converting the wiſe and learned *Cochin-Chineſes*, reputed excellent mathematicians, by means of the eclipse. For the better underſtanding of what we are to ſay, it is requiſite in the firſt place to be acquainted with a cuſtom they have in this kingdom, relating to the ſcience of aſtrology, but particularly of eclipses; for they make ſuch a great account of it, that they have large halls where it is taught in their univerſity; and there are ſpecial allowances aſſign'd the aſtrogers; as for inſtance, Lands which pay them a tribute or ſtipend. The king has his peculiar aſtrogers, and ſo has the prince his ſon, who uſe all their art to ſet down eclipses exactly. But wanting the reformation of the calendar, and other matters, relating to the motion of the ſun and moon which we have, they commit ſome miſtakes in the calculation of the moons and eclipses, wherein they generally err two or three hours, and ſometimes, tho' not ſo often, a whole day; tho' generally they are right as to the material part of the eclipse. Every time they hit right, the king rewards them with a certain quantity of

land; and ſo when they miſtake, that ſame quantity is taken from them.

The reaſon why they make ſuch account of fortelling the eclipse, is becauſe of the many ſuperſtitious at that time uſ'd towards the ſun and moon, for which they prepare themſelves in very ſolemn manner: for the king being told the day and hour a month before the eclipse happens, ſends orders throughout all the provinces of the kingdom, for the learned and common ſort to be in a readineſs that day. When the time is come, all the lords in every province meet with their governors, commanders and gentry, and people with their proper officers in every city and liberty. The greateſt aſſembly is at court, where the principal men of the kingdom are, who all go out with colours and arms. Firſt goes the king cloath'd in mourning, and after him all the court, who liſting up their eyes to the ſun or moon, as the eclipse comes on them, make ſeveral obeiſſances and adorations, ſpeaking ſome words of compaſſion for the pain thoſe planets endure; for they look upon the eclipse to be no other, but that the dragon ſwallows up the ſun or moon; and therefore, as we ſay, the moon is all or half eclips'd; ſo they ſay, *Da an nua*, *Da an bet*; that is, the dragon has eaten half, now he eats all.

Which way of expreſſion, tho' it be nothing to the purpoſe, yet it ſhews that they aſſign the ſame ground for the eclipse originally that we do, which is cutting of the ecliptick, that is the ſun's circle and the line of the courſe of the moon, in thoſe two points which we call the dragon's head and tail, as aſtronomers well know: whence it follows, that the very ſame doctrine, and the ſame terms and names of the dragon, are common both to us and them, and ſo they give names like ours to the ſigns of the zodiack, ſuch as *Aries*, *Taurus*, *Gemini*, &c. And thus in proceſs of time the people have invented fabulous cauſes of the eclipse, inſtead of the true, ſaying that the ſun and moon, when eclipsed are drown'd by the dragon; whereas, at that time they are really in the head or tail of the aſtronomical dragon.

Now to return to the compaſſion they have for thoſe ſuffering planets; when the adoration is over, they begin firſt at the king's palace, and then throughout all the city to fire muſkets and cannon, ring bells, ſound trumpets, beat drums, and play upon other inſtruments, even to clatter-

Their a-  
ſtrogical  
terms  
and ours  
alike.

**BORRI.** ing of the kettles, and other utensils of the kitchen in all houses: and this is done, to the end the dragon may be frighted with the great noise, and not proceed to eat any more, but vomit up what he has already eaten of the sun or moon.

Conversion  
only by  
means of  
an eclipse.

When we were inform'd of this custom, the first eclipse that happened was one of the moon, in the year 1630. on the ninth of December, at eleven at night. I was then in the city *Nuochman*, in the province of *Pukamhi*, where there was the commander of the ward we liv'd in, whose son was become a Christian; tho' the father, as proud of his own learning, despis'd not only our religion but our knowledge; and we earnestly desir'd his conversion, hoping that if he receiv'd the catholick faith, his example would induce those of his ward or quarter to do the same. This man came once to visit us before the eclipse of the moon happened, and in discourse we happened to talk of it, he positively affirming there would be no such eclipse: and tho' we demonstrated it to him, according to our calculation, and shew'd him the figure of it in our books, yet he would never believe it; alledging among other arguments for his obstinacy, that if any such eclipse were like to be, the king would doubtless have sent him notice a month before, according to the custom of the kingdom, whereas there wanted but eight days of the time by us appointed; wherefore he having no such advice, it was a certain sign that there would be no such eclipse. He persisting obstinately in his opinion, would needs lay a wager of a *Cabaia*, which is a silk gown. We agreed to it upon condition, that if we lost we were to give him such a garment; but if we won, instead of paying the gown, he was to come to us for eight days together, to hear the catechize and mysteries of our faith expounded. He reply'd, he would not only do so, but the very moment he saw the eclipse would become a Christian: for he said, if our doctrine was so certain and infallible in such hidden and heavenly things as eclipses are, and theirs so erroneous, there was no doubt but our religion and knowledge of the true God was no less assured and safe, and theirs false. The day of the eclipse being come, the aforesaid gentleman with a great many scholars came to our house at night, bringing them as witnesses of the event. But because the eclipse was to be at eleven at night, I went to say my office, turning up the hour glass in the mean while. An hour before the time these men came several times, calling upon me by way of derision to see the eclipse, thinking I had not withdrawn to say my office, but had hid my self for shame that there would be

no eclipse. Yet they could not but admire at my assurance in answering them, that the hour was not yet come, till the glass was run out, which they gazed at, as if it had been some wonderful thing. Then going out, I shew'd them that the circle of the moon on that side the eclipse began, was not so perfect as it should be, and soon after all the moon being darkened, they perceiv'd the truth of my prediction. The commander and all of them being astonish'd, presently sent to give notice of it to all the ward, and spread the news of the eclipse throughout the city, that every man might go out to make the usual noise in favour of the moon; giving out every where, that there were no such men as the fathers, whose doctrine and books could not choose but be true, since they had so exactly foretold the eclipse, which their learned men had taken no notice of; and therefore in performance of his promise, the commander with all his family became Christians, as did many more of his ward, with some of the most learned men in this city, and other men of note.

Such another accident happened at the same time, tho' among people of greater quality, and in a more eminent place. Tho' the king's astrologers had not foreseen this eclipse, yet those belonging to the prince at *Cacciam*, being more studious and intelligent, foretold it; but with a gross mistake as to time: for it was not of an hour or two, as is usual, but of a whole day, giving out that the full moon, and consequently the eclipse would be a day sooner than it was. *F. Francis de Pina*, who was then at court, had given notice of it to a courtier who was very great with the prince, being his *ongue*; that is, in the nature of matter of the ceremonies. The father told him, That since the eclipse was not to fall out as their astrologers said, but as *F. Christopher Bonri* affirm'd, the following night, he should give the prince his matter notice of it. But the *ongue* not giving entire credit to the father, would not do that duty of his office at that time. The hour appointed by the astrologers being come, and the prince having notice of it, he went out with his whole court, according to custom, to see and help the moon, that as they said was to be eclips'd; but finding he was deceiv'd, and growing angry with his mathematicians for their mistake, he order'd they should forfeit the revenue of a town, according to the custom before mention'd. Hence the *ongue* took occasion to acquaint the prince that the *European* father had, before this happened, told him the eclipse would be the night following. The prince was mightily pleas'd that the fathers should be

The fathers fore-  
told the e-  
clipse  
truer than  
the Co-  
chin-Chi-  
nese astro-  
logers.

right, where his mathematicians had miscarried.

The *omne* repair'd immediately to the father, to know the precise time of the eclipse; who having shew'd him that it was to be exactly at eleven the following night, he still continu'd doubtful of the truth of the matter, and therefore would not wake the prince till he saw the beginning of the eclipse. Then he ran to rouse him, and he coming out with some of his courtiers, perform'd the usual ceremonies and adorations to the moon. Yet he would not make the matter publicly known, for fear of utterly discrediting their books and mathematicians, tho' all men conceiv'd a great opinion of our doctrine, and particularly the *omne*, who from that time forwards for a whole month came to hear the catechising, diligently learning all that belongs to our holy faith. However he was not baptiz'd, wanting resolution to overcome the difficulty of the multiplicity of women, as the ambassador *Ignatius* had done before. He forbore not nevertheless publicly with much fervour to declare our doctrine and law were true, and all others false, and said he would certainly die a Christian, which mov'd many others to desire to be baptiz'd.

An eclipse of the sun mistaken.

Having talk'd of the eclipse of the moon, we will coincide with another of the sun, which happened on the 22d of May, 1621, which the king's astrologers foretold was to last two hours; but having conceiv'd a great opinion of us as to this particular, for their own greater security, they came to ask our opinions concerning it. I told them it was true there would be an eclipse of the sun, the figure whereof I shew'd in our *ephemerides*; but I purposely forbore to let them know, that it would not be seen in *Cochin-China*, by reason of the moon's parallax to the sun. Now they know not what the parallax is, which is the cause they are often deceiv'd, not finding the just time by their books and calculations. This I did, that their error being observ'd, our knowledge might appear the more: I therefore demanded time to find out the precise time, saying in general terms, it was requisite to measure heaven by the earth, to discover whether that eclipse would be visible in their country; and I delay'd the answer so long, till the time of making known the eclipse being come, the astrologers satisfy'd that our book agreed with their opinion, without farther reflection, concluded the eclipse was most certain, and advis'd the king to publish it after the usual manner. When the astrologers had spread their false prediction throughout the kingdom, I gave it out that the eclipse would not be seen at all in *Cochin-China*. This assertion of

VOL. II.

ours was carry'd to the prince, who being *BORRI*, doubtful in the matter, sent his mathematicians to me to ask my opinion, and argue the point. This dispute had no other effect on them, but only to increase their doubts, and hold the prince in suspense, whether he ought to send his orders throughout the kingdom, as the king his father had done, or publish the contrary; for on the one hand it wrought upon him to see that both their books and ours granted the eclipse, wherefore he thought it would be a dishonour to him, in case it happened not to have sent the usual advice; and on the other side, he had a great opinion of us on account of the antecedent eclipse of the moon. Hereupon sending to consult me again, I answer'd, that having calculated the eclipse very exactly, I found it could not possibly be visible in his kingdom; and therefore he need not take any care to send advice about the country, for I would be answerable for his and his astrologers reputation, against the king and his mathematicians. He at last rely'd upon my words, and took no care to give notice in his liberty of the eclipse, the whole court and king's astrologers admiring at it; and they enquiring into the cause of the prince's neglect, were answer'd, that he had better mathematicians in his court than the king his father: by which they understood that some of our fathers being there, he forsook the opinion of the natives for theirs. However the publication they had made being irrevocable, the usual preparations were made against the day of the eclipse, till the hour being come they experimentally perceiv'd their error. The day was clear and not a cloud to be seen, and tho' it was the month of May, when the sun is there in the zenith, and the time of the day about three in the afternoon when the heat is violent, yet the king did not omit to go out with his courtiers, enduring all the burning sun for a long time; but finding himself impos'd upon, and being much incens'd, as well by reason of the great heat he endur'd, as at the ignorance of his mathematicians, who had put him to that trouble without any reason, he reprimanded them severely. They alledg'd for their excuse, that there would be an eclipse infallibly, but that they had made a day's mistake as to the conjunction of the moon, and therefore it would be seen the next day at that same hour. The king submitted to his astrologers, and coming out the next day at the same hour, suffer'd the same inconvenience of heat, to the great shame of his astrologers, who escap'd not unpunish'd; for he not only took away their revenues, but order'd they should kneel a whole day in the court of the palace, bare-headed expos'd to the

9 G

heat

**BORR.** heat of the sun, and to the scorn of all the courtiers. To return to the prince who had got the better in this point, he writ to his father in a jesting manner, That tho' he was his son, he had out-done him as to the eclipse, and had more learned men at his court.

It is not to be imagin'd how much reputation this accident gain'd us among the learned, infomuch that even the king's and

prince's mathematicians came to us, earnestly begging we would receive them for our scholars; and upon this account the fame of the fathers was every where so great, that not only our knowledge in astronomy, but our religion was extoll'd above their own, they arguing from the heavenly bodies to things above the heavens, as I said before.

#### C H A P. VII.

*How God open'd another way to Christianity, by means of the Omfais, or Heathen Priests.*

Conversion  
of a hea-  
then  
priest.

**G**OD in his infinite wisdom foreknowing of how great consequence it would be for the conversion of those heathens, that some of their priests or *omfais* should be converted, because of the great authority they have among all the people, it pleas'd his Divine Majesty to open even this way to his holy faith. An *omfai* whose name was *Ly*, liv'd near to our house, and had the charge of an idol temple, and being a neighbour had frequent opportunities of conversing with us, and of coming to some knowledge of our rules, actions, and course of life. This pleas'd him so well, that proceeding still farther, he would needs be inform'd as to the law of God, whereof we gave him a full account; and coming to discourse of the resurrection of our LORD, shewing him how he rose again, that he and all men might rise again the last day, he was so pleas'd at it, that being inspir'd by God, he ask'd to be baptis'd, which was accordingly granted to him and all his family upon Christmas night, which he spent on his knees in prayer with floods of tears, uttering these words, *Tui ciam biet*; that is, I knew not, as if he would have said, Forgive me my God, for till now I knew you not. Then continuing some time very still, as it were contemplating, he repeated the same words, making a sweet harmony to the new born infant. After baptism he took such an affection for us, that he resolv'd to come to us with all his family, that he might live under our rule; but being inform'd that could not be, because he was marry'd, he concluded to live nearer to our house, that he might regulate his actions by the sound of our bell, even to saying the long litany in his oratory, at the time we use to say it every day, according to the custom of the society. And it is remarkable, that observing me at a certain hour us'd to say our beads walking, he would walk at the same time, to the amazement of his countrymen, who look upon walking as a strange and ridicu-

lous action, because they never going a step but what is about business, or to some diversion, look'd upon our action of walking as idle, because we went to a place to no other end but to return; so that the people flock'd to see us walk, and admiring the strangeness of it said, *Omfai di lay*; that is, the father goes and come, goes and comes. Yet their gazing did not make *omfai Ly* leave his custom, which tended to nothing but to be like us in all points. He had but one wife, and had lived about thirty years, which was his age, so strictly up to the law of nature, that he had never, as he said, to that time, knowingly deviated in any matter of conscience from what was just and upright; and his adoring of idols was because he thought it contrary to reason not to adore them. This shews how true that doctrine of divines is, to wit, that God never fails to have baptism administered, either by the hands of men, as this was, or the ministry of angels, to a heathen who lives a good moral life, according to the dictates of reason, and law of nature. This *omfai Ly* wholly devoted himself to the service of God, and after providing for the maintenance of his family, all he and they could earn was bestow'd upon our church, taking special care of its neatness and decency, and of adorning the altars.

A notable  
moral hea-  
then.

Nor was this all God requir'd of this his belov'd servant; for he so inflam'd his heart, that he applied himself to preach the faith of CHRIST publicly, making the mystery of the resurrection the usual subject of his discourse, whereby he attracted and converted abundance, not only of the common sort, but several *omfais*; for tho' he was none of the most learned, yet his fervour so well supply'd that defect, that among those who came to desire baptism, there was one of the most learned and famous men in the kingdom, whose authority, he himself proving the falsity of the heathen sects, immediately increas'd the harvest of the church. This man there-  
fore

Other  
converts.

fore took upon him to oppose the other gentiles, easily confuting them, as being well acquainted with the grounds they went upon; herein very much easing our fathers, who not being so well acquainted with their sects, could not so well oppose them.

Several  
forts of  
*omfais*.

And in truth there was need of such a help; for there is such variety of *omfais* in that country, that it looks as if the devil had endeavoured among those gentiles, to represent the beauty and variety of religious orders instituted by holy men in the catholick church, their several habits answering their several professions; for some are clad in white, others in black, others in blue, and other colours; some living in community, some like curates, chaplains, canons, and prebends; others profess poverty, living upon alms; others exercise the works of mercy, ministering to the sick, either natural physick, or magick charms, without receiving any reward; others undertaking some pious work, as building of bridges, or other such things for the publick good, or erecting of temples, and going about the kingdom, begging alms to this purpose, even as far as the kingdom of *Tonchin*; others teach the doctrine of their religion, who being very rich, have publick schools, as universal masters. There are also some *omfais* who profess the farriers trade, compassionately cure elephants, oxen, and horses, without

asking any reward, being satisfy'd with any thing that is freely given them. Lastly, Others look to the monasteries of women, who live in community, and admit of no man among them but the *omfais* who looks to them, and they are all his wives.

There are vast temples with beautiful towers and steeples, nor is there any town, tho' never so little, without a temple to worship its idols, which are generally very large statues, with abundance of gold and silver shut up in their breasts or bellies, where no body dares to touch it, till extreme necessity obliges some thief to gut the idol, without regard to so great a sacrilege as that is accounted among them; and what is very remarkable, they have chaplets and strings of beads about their necks, and make so many processions that they outdo the Christians in praying to their false gods. There are also among them some persons resembling abbots, bishops, and arch-bishops, and they use gilt staves, not unlike our crostiers, insomuch that if any man come newly into that country, he might easily be persuaded there had been Christians there in former times; so near has the devil endeavoured to imitate us. This will give us an opportunity of adding here a chapter of the sects in *Cochin-China*, to give some light how we may draw that people out of such darkness, and bring them into the light of the gospel.

## C H A P. VIII.

## A short Account of the Sects in Cochín-China.

THE end of all sects is either the god they adore, or the glory and happiness they expect, some believing the immortality of the soul, others concluding that all ends when the body dies. Upon these two principles the eastern nations build all their sects; all which took their origin from a great metaphysician of the kingdom of *Siam*, whose name was *Xaca*, much antienter than *Aristotle*, and nothing inferior to him in capacity, and the knowledge of natural things. The sharpness of this man's wit raising him to consider the nature and fabrick of the world, reflecting on the beginning and end of all things, and particularly of human nature, the chief lady of this worldly palace; he once went up to the top of a mountain, and there attentively observing the moon, which rising in the darkness of the night, gently raised it self above the horizon to be hid again the next day in the same darkness, and the sun getting up in the morning to set again at night, he concluded that as well moral as physical and natural things were nothing, came of nothing,

The philosopher  
*Xaca*.

and ended in nothing. Therefore returning home, he writ several books and large volumes upon this subject, calling them, *Of nothing*; wherein he taught that the things of this world, by reason of the duration and measure of time, are nothing: for tho' they had a being, said he, yet they would be nothing, nothing at present, and nothing in the time to come; for the present being but a moment, was the same as nothing.

His second argument he grounded on the composition of things; let us instance, said he, in a rope, the which not being naturally distinguished from its parts, inasmuch as they give its being and composition, so it appears that the rope as a rope is nothing; for as a rope it is no distinct thing from the threads it is compos'd of, and the threads themselves are no distinct thing from the hemp they are made of, and the hemp has no other being but the elements, whereof its substance consists: so that resolving all things after this manner into the elements, and those to a sort of *materia prima*, and meer *potentia*, which

His opinion, on, that all this world is nothing.

**BORRI.** which is therefore actually nothing, he at last proved, that as well the heavenly things, as those under heaven, were truly nothing.

So of all  
moral  
things

In the same manner did he argue as to moral things: that the natural happiness of man did not consist in a positive concurrence of all that is good, which he looked upon as impossible, but rather in being free from all that is evil, and therefore said, it was no other thing but to have no disease, pain, trouble, or the like; and for a man to have such power over his passions, as not to be sensible of affection or aversion, to honour or disgrace, want or plenty, riches or poverty, life or death, and that herein consisted true beatitude. Whence he inferred, that all these things being nothing, they took their origin as it were from a cause not efficient but material, from a principle which in truth was nothing, but an eternal, infinite, immense, immutable, almighty, and to conclude, a God that was nothing, and the origin of this nothing.

The  
world  
how made

As a prelude or introduction to his sect, this philosopher gave some account of the making of the world under two metaphors. The one was, that the world came out of an egg, which stretched out so vastly, that the heavens were made of the shell; the air, fire, and water, of the white; and of the yolk, the earth and all earthly things. The other metaphor he took from the body of a vast great man, whom they call *Banco*, whom he would call *Microcosm*, saying that the mass of the world came from him, his skull extending to form the heavens, his two eyes making the sun and moon, his flesh the earth, his bones the mountains, his hair plants and trees, and his belly the sea, and thus applying all the limbs and parts of man's body, to the fabric and ornament of the world; he added, that the other men spread about all the world, were made of this great man's lice.

Another  
doctrine  
of the  
same phi-  
losopher.

Having established this doctrine of nothing, he gathered some scholars, by whose means he spread it throughout all the east. But the *Chinese* who knew that a sect which reduced all things to nothing, was hurtful to the government, would not hearken to it, nor allow there was no punishment for wicked men, or that the happiness of the good should be reduced only to the being free from sufferings in this world, and the authority of the *Chinese* being so great, others following their example, rejected his doctrine. *Xaca* dissatisfied that he was disappointed of followers, changed his mind, and retiring writ several other great books, teaching that there was a real origin of all things, a Lord of heaven, hell, immor-

tal, and transmigration of souls from one body to another, better or worse, according to the merits or demerits of the person; tho' they do not forget to assign a sort of heaven and hell for the souls departed, expressing the whole metaphorically under the names of things corporeal, and of the joys and sufferings of this world.

This second doctrine being made public, the *Chinese* received it, and above others the *bonzis*, who are generally the meanest and most inconsiderable people in *Japan*, who being zealous for their spiritual advantage admitted this doctrine, and preserved it in twelve several sorts of sects all differing from one another, tho' that which is most followed and esteemed, is the opinion and sect that believes all to be nothing, which they call *genfu*. These sometimes go abroad into a field to hear a sermon, that is a discourse of bliss made by a *bonzo*, who treats of no other subject, but to persuade his congregation, that human bliss is nothing, and that he is happy who values not whether he has children or no children, whether he is rich or poor, sick or well, and the like; and the *bonzo* preaches this doctrine with such strength of argument, and vehemency, that the audience being fully bent upon the contempt of all things, which in themselves they look upon as nothing, suffering themselves to be in a manner transported, they express their satisfaction and happiness in this manner, that is often crying out with a loud voice, *xin, xin, xin*; that is, nothing, nothing, nothing, accompanying their voices with certain bits of boards they clap between the fingers of one hand striking them together with the other (as boys play on their snappers) and with this noise they are quite besides themselves as if they were drunk, and then they say they have done an act of bliss. The *Japanese* and others making so great account of this opinion of nothing, was the cause that when *Xaca* the author of it was come to his last, calling together his disciples, he protested to them upon the word of a dying man, that in the many years he had lived and study'd, he had found nothing so true, nor any opinion so well grounded, as was the sect of nothing; and tho' his second doctrine seemed to differ from it, yet they must look upon it as no contradiction or recantation, but rather a proof and confirmation of the first, tho' not in plain terms, yet by way of metaphors and parables, which might all be apply'd to the opinion of nothing, as would plainly appear by his books.

But it is time to return to our *Cochin-Chinese*, who not receiving this most foolish and vain doctrine, which denying the substantial

The sect  
that be-  
lieves all  
to be no-  
thing.

Errors of  
the Co-  
chin-Chi-  
nese.

stantial form, reduces all things to nothing, they generally throughout all the kingdom hold the immortality of the soul, and consequently the eternal rewards for the just, and punishments for the wicked, yet mixing a thousand errors with these truths. The first of which is, that they do not distinguish between the immortal soul and the demons, calling both by one and the same name *Maa*, and attributing to them both, the same practice of doing mischief to the living. The second is, that they assign one of the rewards of the soul to be transmigration from one body to another, more worthy, nobler, and in greater dignity; as from one of the common sort to a king, or great lord. The third, that the souls of the dead stand in need of sustenance and corporal food, and therefore at certain times in the year according to their custom, the children make plentiful entertainments for their dead parents, men for their wives, and friends for their acquaintance departed, expecting a long time for the dead guest to come and sit down at table to eat. We one day confuted these errors with arguments which the philosophers call *à priori*, and therefore told them that the soul was a spirit, and had no mouth or other material part to eat, and therefore they were deceived to think they could feed. And then *à posteriori*, for in case they did eat, then the dishes would not be as full after they had done as they were before. They laughed at these arguments, saying, these fathers know nothing; and to solve both difficulties, answered, that meat consisted of two parts, one the substance, the other the accidents of quantity, quality, smell, taste, and the like. The immaterial souls of the dead, said they, taking only the substance of the meat, which being immaterial, was proper sustenance for the incorporeal spirit, left only the accidents in the dishes, as they appear to our corporal eyes, to which purpose the dead had no need of corporeal parts as we said. Any wife man may by this false answer discover

the acuteness of the *Cochin-Chinese* philosophers, tho' they absolutely err as to the reality of the argument.

They also err in respect to the souls themselves, adoring those of men who were looked upon as holy in this world, adding them to the number of their idols, whereof their temples are full, placing them orderly according to their several degrees, in rows along the sides of the temples, the least first, and so bigger and bigger, till the last are extraordinary large. But the high altar being the most honourable place in the temple, is purposely kept empty, behind which is a vacant dark space, to express that he whom they adore as God, and on whom the pagods, who like us were visible and corporal men, is invisible, wherein they think the greatest honour consists. Such a multitude of idols, by them accounted gods, giving us occasion to endeavour to demonstrate to them, that there can be but one only God: They answered, they agreed to it, supposing those that were placed along the sides of the temples, were not they that had created heaven and earth, but holy men whom they honoured, as we do the holy apostles, martyrs, and confessors, with the same distinction of greater and lesser sanctity, as we assign among our saints. And therefore to corroborate their assertion they added, that the vacant dark place about the high altar, was the proper place of the Creator of heaven and earth, who being invisible, and quite remote from our senses, could not be represented by visible images of idols, but that under that vacuity and darkness the due adoration was to be given him as to a thing incomprehensible, using the intercession of the idols, that they may obtain favours and blessings of him. And altho' according to what has been hitherto said, they seem to have an efficient and intellectual cause for God, yet upon mature examination of the matter and their books, we find that they certainly adore a predominant element.

# C H A P. IX.

## How God opened another Way to the Conversion of the meaner sort by miraculous Means.

Frequent apparitions of devils.

IT remains that we shew how God acting conformably to the mean vulgar people of *Cochin-China*, who were used to see phantoms, visions, and apparitions, the devil often appearing to them, was pleased to shew some miracles, to the end that declining in their opinion of diabolical prodigies, they might own the only Lord and singular worker of true wonders. The

devils appear so frequently among those heathens, that not to speak of the oracles they deliver by the mouth of idols, which are in great esteem among the wretched gentiles, they walk about the cities so familiarly in human shapes, that they are not at all feared but admitted into company, and this is carried so far, that there are abundance of *Incubi* and *Succubi*. And

*Incubi and Succubi.*

**HORRIBLE** among great people those husbands account themselves happy, who know their wives have such familiars; for generally they have to do with none but married women, publicly boasting that they are worthy to mix with a nature so much above their own as is the devils. It happened in my time, that a woman of great quality, mother to two sons who were Christians, envied by her neighbours not so much for her beauty, as for her dishonest familiarity with the devil, positively refusing to become a Christian, came to die in labour, and by the assistance of the devil brought forth two eggs: Now it being held as most certain among them, that the devil her *Incubus* was god of the rivers, they did not bury the body in a cave, building a chapel over it as is the usual custom, but carrying it in solemn procession to a river cast it into the deep, together with the two eggs, saying, let her go to the lord of the river, since she was worthy to have to do with him when living. Among the common sort this filthiness is not esteemed an honour, but they rather account it a grievous distemper when their women are thus molested by the devil, as we should their being possessed. These women therefore understanding that the religion of the fathers was altogether opposite to the devil, they imagined they might have some medicine against this distemper, calling holy things, as the water of baptism, *Agnus Dei*, and the like, medicines, and therefore came to our house to beg such medicines; and by the grace of God all those that carried away with them any bit of *Agnus Dei*, were never more molested by the devil, yet with this difference, that those who were not Christians saw the *Incubus* come to the bed's-side, but had not power to lay hold on, or touch their persons, whereas the Christians perceived that he could not come near the chamber-door, which occasioned several to be baptized.

Other  
monstrous  
visions.

Tho' these *Incubus* devils appearing in human shapes, do no harm to the body, yet sometimes there are others that appear in horrid and frightful shapes, and the *Cochin-Chinenses*, who have often seen, describe them after the same manner as we paint them, for example, with a cock's face, a long tail, a bat's wings, a hideous look, bloody flaming eyes; and when they appear in such shapes, they are much feared, being then generally harmful to men, sometimes carrying them up to the tops of houses to cast them down headlong. We once heard a wonderful noise of people in our street,

crying out very loud, *Maqui Maco*, that is, the devil in a monstrous shape; whereupon some gentiles came running to defend us, that since we had weapons against those evil spirits, we would go relieve those distressed people who were infested by them. Having recommended our selves to God, and arm'd our selves with crosses, *Agnus Dei* and relics, we went two of us to the place where the devil was, and came so near, that we only wanted turning of a corner to be upon him, when he suddenly vanished, leaving three prints of feet upon the pavement, which I saw, and were above two spans long, with the marks of a cock's talons and spurs. Some attributed the devil's flying to the virtue of the holy cross and relics we carried with us.

These frightful apparitions God has made <sup>Good</sup> use of to attract many to his holy faith, <sup>visions.</sup> yet not denying them good visions, as will appear by the following accidents, which happened before me in that kingdom. The first was, that as we were one day in our own house, we saw a procession of a vast multitude of people in a field making towards us, whither when they came, being asked what they would have, they answered, that a most beautiful lady came from their land through the air, on a throne of bright clouds, who bid them go to that city, where they should find the fathers, who would shew them the sure way to bliss, and the knowledge of the true God of heaven. This made us give thanks to the blessed Virgin, whose this great benefit was owned to be, and having catechised and baptized the people sent them home well pleased.

The second was at another time, F. Francis Buzome and I returning homeward together, such a multitude of people came to another place, who having paid us very much respect, told F. Francis Buzome, they were come to him to teach them what he had promised them the night before when he was in their town. The father was astonished at their demand, having never been in the place they spoke of; but examining into the matter, I found that God of his infinite mercy had caused some angel in the father's shape, or in a dream had given those people some knowledge of our holy faith. The fame of these miracles being spread abroad, such numbers of people were converted, that the church given us by the governor was too little, and we were forced to build one larger, his wife, children, and kindred, with many other Christians contributing towards it.

CHAP. X.

Of the Churches and Christians of Faifo, Turon, and Cacchiam.

What the fathers did at Faifo.

**F** Francis de Pina being gone to Faifo, a city of the *Japoneses*, as was said before, he there joined F. Peter Marques, and they did great service in that city. The last of them, who was master of the *Japonefe* tongue, in a short time reformed some of those Christians who were become libertines, and kept women, and converted many pagans. The other who understood the language of *Cocbin-China* made many Christians, and having convinced some *bon-zos* and *om-fais*, by that means drew over many more to the holy faith; so that between *Japoneses* and *Cocbin-Chinefes*, that church for number and religious observance might compare with many in *Europe*, such was their piety, zeal, frequenting of the sacraments, and other godly works. The church of *Turon*, which we said in the second chapter of this book, the heathens burnt down during the first persecution, was by God's permission rebuilt by means of the fathers of the society, who gained many Christians in that city.

At Turon.

At Cacchiam.

Abundance of people were likewise converted to our faith at *Cacchiam*; which good work was much forwarded by the

*Omgne*, who on account of the father's BORRI. fortelling the eclipse so certainly, as was before observed, publicly affirmed, there was no other true religion but that the fathers taught. This was the state of affairs there, when I came away out of that country for *Europe*, which was in the year 1622.

Afterwards by the annual letters sent me by those fathers, my companions left there cultivating that vineyard, I understood that there were still about a thousand converted and baptized in a year, and that Christianity flourished more than ever it had done at *Cacchiam* particularly. But now of late they write, that the king had forbid any more becoming Christians, and threatned to expel the fathers out of the kingdom, and this because the *Portuguese* trade failed. Yet it pleased God this persecution went no farther, the king being satisfied, provided one of the fathers went away to *Macao*, to endeavour to persuade the *Portuguese* to continue the trade, as it seems was afterwards done; so that things are now quiet, and the fathers continue gaining new Christians as they did at first.

CHAP. XI.

Of the Kingdom of Tunchim.

**W**HEN the superiors of *Macao* sent me into *Cocbin-China*, they told me, they did not absolutely design I should continue in that mission, but only to learn the language, that I might afterwards discover the kingdom of *Tunchim*. For this reason during those five years I dwelt there, I almost made it my business to enquire into, and get certain information of the affairs of that kingdom, the language being the same, as formerly it was but one kingdom. I will therefore say as much of it as any way concerns *Cocbin-China*, which has some dependance upon *Tunchim*, and this according to the accounts given me by natives of *Tunchim*, who came to the province of *Pulucambi*, where I resided most part of my time; the rest I will leave to the news we shall receive from our fathers, who are there still making further discoveries.

A description of Tunchim.

This kingdom, besides *Cocbin-China* which belongs to it, contains four other provinces, all extending equally in length and breadth. In the very center of them is the royal city of *Tunchim*, from which all the kingdom takes name, there the

court is kept, and the king resides, being encompassed on all sides by those four provinces, composing a square four times as big as *Cocbin-China*. On the east-side of this kingdom is the gulf of *Ainam*, into which falls a great and navigable river that runs down eighteen leagues from the city *Tunchim*, and *Japonefe* ships call'd *Jonks* go up it. This river generally overflows twice a year, in *June* and *November*, drowning almost half the city, but it lasts not long. On the south are the frontiers of *Simwa*, the court of *Cocbin-China*, as has been observed already. On the north of it is *China*, without the defence of a wall, the trade and commerce between the *Chinese* and *Tunchinefes* being so mutual and constant, that it will not allow of walls and gates shut, as they are again? other foreigners. This is the reason that induces the fathers of our society to attempt the entrance into *China* that way, knowing they shall not on this side meet with all those impediments that strangers meet with throughout all the rest of the kingdom, and more especially about *Canton*. Lastly, on the west it borders on the kingdom of

1

Lai,

*BORRI. Lai*, into which *F. Alexander Rhodes* of *Avignon* made his way thro' *Cochin-China*; and this kingdom, I am of opinion, cannot but border upon that of *Tibet*, newly discovered; which I am apt to believe, as well by reason of the extent and length of the land of *Tibet* and borders of *Lai*, because by the greatness and compas of these two kingdoms, it seems impossible that any other land should lie betwixt them; as also much more on account of what the same fathers who were there relate of *Tibet*, who report that the farthest province of *Tibet* eastward borders upon, and trades with a people, who sell them raw silk and fine dithes, like those of *China*, and such like commodities, which we know *Tunchim* abounds in, and sell them to the *Lais*.

The government. As to the government of this kingdom it is hereditary, and ruled as follows: The supreme regal dignity resides in one they call *Buna*; but he of himself does nothing at all, all things being left to his favourite, whom they call *Chiuua*, whose power is so absolute both in peace and war, that he is come by degrees to own no superior; the *Buna* remaining in his royal palace, quite cut off from all management of the publick affairs, satisfied with an exterior respect due to him as a sort of sacred person, and with the authority of making laws, and confirming all edicts. When the *Chiuua* dies, he always endeavours to have his son succeed him in the government; but for the most part it falls out that the tutors of those sons aspiring themselves to that dignity, endeavour to murder them, and by that means possess themselves of the dignity of *Chiuua*.

Power. The *Chiuua's* power is so great, that suitable to the bigness of the kingdom, he is able to bring into the field three or four times the number of men as the king of *Cochin-China*, whose army as was said above amounts to 80000 men. Nor is it any

difficult matter for the *Chiuua*, as often as he pleases, to raise 300000 armed men or more, because the prime lords of his kingdom, such as among us, dukes, marquesses, and earls, are oblig'd in time of war to furnish them at their own expence. The *Buna's* strength is not above 40000 men for his guard. Yet he is always own'd as superiour to the *Chiuua* of *Tunchim*, by the king of *Cochin-China*, and by that other *Chiuua*, we observ'd in the first book to be fled into the province bordering upon *China*, tho' these are continually at war against one another; and the king of *Lais* bordering upon *Tunchim*, pays him a certain tribute.

Therefore when we say this crown is hereditary, it is to be understood only in reference to the *buna* whose children always succeed, the royal race being continued in his family. This is as much as I thought fit briefly to say of the kingdom of *Tunchim*, from what I could learn of it till my return into *Europe*.

Since then I have been inform'd, that *F. Julian Baldinotte*, an Italian born at *Pistoria* in *Tuscany*, was sent into that kingdom to make some way for the gospel, and arriv'd from *Macao* at the city *Tunchim*, after a month's sail. As for what the said father found in that country, what pass'd between the king and him, the solemnity of his reception, and the first foundation he laid for Christianity, I refer the reader to the account given lately by that father himself; and we are still expecting fresh advices from the other fathers, as *F. Peter Marques* a Portuguese, and *F. Alexander Rhodes* of *Avignon*, who we said before had been in *Cochin-China* and are there still gaining Christians. We therefore hope both these kingdoms of *Tunchim* and *Cochin-China*, will soon be united to the flock of the church, acknowledging and giving the due obedience to the universal pastor and vicar of CHRIST our LORD on earth.

### THE CONCLUSION.

IT is not possible but that such as have least inclination to the discovery of the world, and are most affected to their own countries and homes, must be excited by this short account to desire to see not only the variety but the truth of such strange things, which tho' they be not supernatural, may yet be term'd miracles of nature. Such are those I have said I saw in *Cochin-China*, a land as to its climate and seasons of the year habitable, by reason of the fruitfulness of its soil abounding in provisions, fruit, birds, and beasts, and the sea, in choice and delicious fish; and most healthy, because of the excellent temper of the air,

inasmuch that those people do not yet know what the plague is. It is rich in gold, silver, silk, *Calambé*, and other things of great value, fit for trade by reason of the ports and resort of all nations: peaceable, because of their loving, generous, and sweet disposition; and lastly secure, not only by the valour and bravery of the *Cochin-Chinezes* accounted such by other countries, and their store of arms, and skill in managing them; but even by nature, which has shut it in on the one side by the sea, and on the other by the rocky *Alps*, and uncouth mountains of the *Kemois*. This is that part of the earth call'd *Cochin-China*, which

**BORRI.** which wants nothing to make it a part of heaven, but that God should send thither a great many of his angels, so S. *John Chrysostom* calls apostolical men, and preachers of the gospel. How easily would the faith be spread abroad in this kingdom of *Cochin-China*, where there are not those difficulties which we fathers of the society dispers'd about the *East*, do meet with in other countries; for there is no need here of being disguis'd or conceal'd, these people admitting of all strangers in their kingdom, and being well pleas'd that every one should live in his own religion. Nor is it necessary before preaching to spend many years in studying their letters and hieroglyphicks, as the fathers in *Cbina* do, for here it is enough to learn the language, which as has been said is so easie, that a man may preach in a year. The people are not shy, nor do they shun strangers, as is practis'd in other eastern nations, but make much of them, affect their persons, prize their commodities, and commend their doctrine.

They do not lie under that great impediment for the receiving the grace of the gospel, that is, the sin of sodomy, and others contrary to nature, which is frequent in all the other eastern countries, the very name whereof the *Cochin-Chinese* naturally abhor. In short, these people may very easily be taught the principal mysteries of our holy faith, they, as we have shewn, in a manner adoring but one only God, accounting the idols as inferior saints, allowing the immortality of the soul, eternal punishments for the wicked, and bliss for the

just, using temples, sacrifices, processions, so that changing the objects, it would be easie to introduce the worship. That there will be no difficulty in making out the mystery of the holy eucharist may appear by the distinction they make between the accidents and substance of the meat they provide for the dead, as has been said above in this second book. All these things inflame the minds of the children of the society, who tho' recluse and shut up in the colleges and provinces of *Europe*, have an ardent desire to convert the world. And tho' many of them put it in practice with the assistance of the holy see apostolick, which with a fatherly care relieves the mission of *Japan*; as also by his catholick majesty king *Philip*, and his council of the *Indies*, who so frequently with incredible bounty supply the *East* and *West-Indies* with ministers of the gospel, yet it is impossible that these two great pillars which support other mighty weights, and bear almost all the world on their shoulders, can sufficiently supply all that daily occurs and is discover'd. I therefore trust in God, that his Divine Providence will rouse up some generous soul, inflam'd with the zeal of God's honour, to send and maintain some evangelical ministers, who satisfy'd with a religious and poor sustenance, may convey the food of the gospel not only throughout *Cochin-China*, but unto the great kingdom of *Tuncbin*, founding a church and christian flock that may compare with the most renowned in the world.
